"The problem of the hospital practice of medicine is becoming extremely acute, especially so within the last year or two, and especially so since the movement that was instituted by the American College of Surgeons The American College of Surgeons started what I believe was a most pernicious move, in writing and communicating with the hospitals of our country, asking them to set aside a department in the hospital to which the public may come and receive a periodic physical examination at a flat fee, conducted by the staff, who are to be remunerated by the hour If you read the Journal, you have probably seen that we opposed that We registered a vicious protest against promulgating such a move, causing or inspiring hospitals to practice medicine"

The principal speaker in the evening session

Licensed

PHYSIOTHERAPIST

Westchester Institute for Physical-Therapy

233 South Second Avenue Mount Vernon, N Y

Telephone, Oakwood 1643-1644

Conducted according to the ethics of the medical profession

Patients are accepted only upon the recommendation of their physicians

Equipped for giving the following forms of physical-therapy

Baking Treatment
Diathermy
Massage
Vibro-Massage and
Medical Reconstruction Work

Hydrotherapy Quartz Lamp Thermo-Light Zoalite High Colonic Irrigations

Rooms available for resident patients

A physician is available for the resident cases whenever their attending physician is unable to visit the patient

Regular reports of progress are sent to the physician who refers the patient

Attention is given to special diets as ordered by their physicians

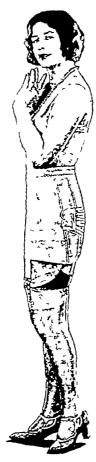

VISITING PHYSICIANS ARE ALWAYS WELCOME

The "Pomeroy" Supporting Corset

೯೩೮ ೂ

A good corset, properly made and fitted, not only gives needed support to the vital organs, but moulds the figure to correct and graceful lines

The Pomeroy is ideal for this purpose, for it is so designed that the uplift is given by the corset itself with no need for additional belt or other contrivances The intersecting laces give an extra upward and backward lift which further helps the muscles of the abdomen to give the necessary support

agency man experienced in this kind of work to undertake it for us as a side line. He has put a man in charge of medical collecting in our county He furnishes a form letter to send out.

"That collects pretty nearly fifty per cent of the hard bills If they don't respond we turn it over to the Bureau of Credits, and they use their usual method of collecting"

Concerning finances of County Societies Dr Moore of Cadillac said

"One of the strongest things I think we have had in our Society to hold our members together has been our county contract for the indigent I have answered many letters and questions in regard to it from different societies over the state I think it has been a wonderful thing

to hold our Society together

"We have a Tri-County Medical Society made up of Missaukee, Kalkaska and Wexford Coun Our county contract for the indigent poor is for Wexford County This is taken at our regular price for the year, and the doctors are rotated monthly in the territory in the city, and the country is assigned to the doctors in the coun-This gives something in return As long as they are members of the Society they are entitled to compensation for taking care of the indigent poor of their territory, and when they get their little check every three months, as they do, it sort of keeps them in touch with the Society

(A somewhat similar plan is described in this

Journal of June 1, 1928, page 693)

Concerning the payment of bills Dr Warnshuis said

"I think it is just a lot of old fogey ideas to make the Secretary secure one, two or three counter-signatures upon any voucher for the expenditure of funds As a rule, the money is not sufficient to make one desire to abscond, and secondly, the individual is usually honest when he is a Secretary because he couldn't be a Secretary if he were not honest"

On the subject of endowment for the State So-

ciety, Dr Warnshuis said

The solution that we are seeking is this endowment foundation, to which we hope to secure endowment contributions to the extent of \$250,000 or possibly \$500,000 given and so arranged that that endowment capital or principal sum will re-Under that plan that main intact in perpetuity endowment foundation has been incorporated and turned over to one of the large trust companies of this state After we get to a certain amount, we hope to branch out among some of our wealthier lay individuals and give to them tangible evidence of the work that has been and is being accomplished for the good of the people by the Michigan State Medical Society, and secure outside contributions so we can have a fund of a

(Continued on page 831-adv xv)

COUNTY SOCIETY PROGRAMS

The June issue of the Journal of the Medical Society of New Jersey contains the following editorial description of a new idea for the program of a county medical society

"For at least four years the Morris County Society has been devoting one or more meetings per annum to symposiums upon selected topics, different aspects of the subject being assigned to chosen members and a sufficient time allowed for each to work up his paper, and we have previously expressed admiration for the excellent results obtained. During the past winter the Camden County Society has employed a similar plan, the May Journal contains one of their symposiums, consisting of four papers on the subject of 'fractures,' and this month we present their symposium on 'arthritis'. In both of the counties mentioned the plan has worked advantageously."

ILLEGAL MEDICAL PRACTICE

The physicians of West Virginia are considering the problem of dealing with illegal practitioners and have planned the following procedure which is described editorially in the June issue of the West Virginia Medical Journal

"West Virginia does not need a new medical practice act. The present statute now in effect is very satisfactory and it covers the field of medicine even better than might be expected. But West Virginia does need enforcement.

"Our committee on public policy and legislation, together with the state health council, has worked out what we believe is a real and final solution of this perplexing problem of enforcement. The secret lies in the employment of a full-time attorney who has no other duty except that of ridding the state of illegal practitioners, quacks and pill peddlers. An appropriation for the employment of this attorney will be requested from the next legislature.

"The West Virginia State Medical Association has never been and never wants to be a political organization. But we must fight for certain things that will protect both ourselves and the public if we are to expect the advancement of scientific medicine in this great state. If we succeed in getting through an appropriation for the employment of a medical practice act enforcement officer, then will we lead down a new path over which our sister states will soon follow."

was Dr W H Ross, of Brentwood, N Y, one of the Trustees of the Medical Society of the State of New York, who described "Medical Legislation in New York State" His paper was published on page 707 of the June fifteenth issue of this Journal

The immediate occasion of the invitation extended to Dr Ross to describe the operation of medical laws in New York State was that the Medical Society of Michigan has a committee which is studying the needs of that state. This committee consists of Dr Guy L Kiefer, State Commissioner of Health, Chairman, Dr McIntyre, of Lansing, Dr John Sundwall, of Ann Arbor, Dr J B Jackson, of Kalamazoo Dr C F McClintic, of Detroit, and Dr W H Marshall, of Flint Conditions in Michigan are practically the same as those in New York The chiropractors have been defeated in their efforts for recognition, and both the physicians and the educated laymen are anxiously planning laws that will be acceptable to judges and district attorneys Dr Ross told how the New York Practice of Medicine Act of 1926 was enacted with the help of interested lay workers, and how its execution is in the hands of the State Department of Education and the Attorney General, but with a Grievance Committee to pass upon questions of ethics and medical practice

The comments of the Michigan physicians were almost exact duplications of those of the doctors of New York during the two years of intense agitation of the features of the new law. The feature which the Michigan doctors especially criticized was the fee for annual registration. Whatever the New York doctors may think of that fee, the legislators and administrators of New York State took the stand that a license to a physician was of exactly the same nature as that to a pharmacist, or architect, or accountant, and

the recipient should pay for it

The further fact remains that the legislators and administrators refused to provide state funds for administering the proposed law, but were willing to divert the license fees to that purpose

The physicians of New York State accepted the ultimatum of the law makers, and the law which they were willing to pass. The new law contains all the essential features which the physicians desired, and about the only objectionable feature is that of annual registration at a fee of two dollars.

Dr Ross took the attitude that the administration of the Medical Practice Act of 1926 had ac complished all that the promoters of the law had expected from it, and that the law was well suited to the State of Michigan

Altogether the report of the Michigan Sécretaries' Conference is of great interest and practical value

NOTES ON ENDOCRINOPATHIES*

By THOMAS P SPRUNT, MD, BALTIMORE, MD

From the Medical Clinic of Drs Barker, Cross and Sprunt, Baltimore, Md

THE endocrine system with its close relationship to the nervous system and to metabolism is undoubtedly an important part of the human body, particularly in regard to its growth, its development and the co-ordination of its various activities

We know something of the details of the physiology and of the pathology of these ductless glands, and gradually new bits of knowledge are being added. But such is the glamor shed over these glands by zealous enthusiasts and by commercial exploiters that I feel sure we are apt to assume a much greater knowledge than we really possess. Certainly the layman who has read much about glands very often attributes to us a knowledge and a therapeutic power far beyond that to which we may reasonably lay claim

I propose this morning to exchange views with you concerning the clinical manifestations of disorders of some of the endocrine glands and with this in mind will indicate the method by which we are accustomed to study endocrine cases, summarize briefly with the aid of lantern slides some of the well defined clinical pictures of ductless gland disorders, point out the difficulties we often experience in classification, and say something about the relationship of endocrine glands to the constitution

Some of the patients going through the diagnostic study in the Clinic are referred to me for a Special Endocrine Note. The choice of patients is determined at the first examination if there are features suggesting a possible endocrine disorder or if the patient himself manifests a distinct interest in "glands". This note is made for several reasons first, as an aid in diagnosis, second in order to insure a uniform method of recording the data for subsequent study, and third, to assure the interested patient (a psychotherapeutic procedure) that everything possible is being done to demonstrate any glandular participation in his malady. In making this note

each of the important endocrine glands is considered in turn and under the heading of that gland the positive and the important negative data in each system of the body are recorded Thus, under the heading of the Thyroid Gland, the possibly pertinent data are noted in (1) The Endocrine System, (2) Metabolism, (3) Bones, Muscles, Joints, (4) The Respiratory System, (5) The Cardiovascular System, (6) Blood and Hematopoetic Organs, (7) Digestive Apparatus, (8) Urogenital Apparatus, (9) The Nervous System, including the psychic, the organic neurological features, the autonomic nervous system, the integument and its appendages Similarly, in the consideration of Hypophysis, Gonads, Adrenals, etc., the possibly pertinent data are arranged systematically. Necessarily by this method there is a good deal of reduplication of data, but at the conclusion of the examination an impression from the standpoint of this general survey of the endocrine glands is recorded When the general diagnostic study has been completed the integrator of the study attempts to place the proper valuation upon the endocrine data as well as upon those obtained by other examinations and to weld the several essential features brought out by this study into a more or less harmonious whole

The special endocrine examination may have demonstrated that the patient presented one of the so-called classical endocrine syndromes

THE CLASSICAL ENDOCRINE SYNDROMES

Thyroid—The thyroid has always been the leader among the endocrine glands. It is one of the most important, one of the most accessible, the most thoroughly studied. In its diseases we feel rather surer of our ground than is the case with other endocrinopathies.

We may divide disturbances of the thyroid into (1) Those associated with overactivity of the gland (hyperthyroidism exophthalmic goitre, toxic goitre), and (2) Those associated with under-function of the thyroid gland (hypothyroidism myroidem and the problem.

roidism, myvedema, cretinism)

or by the Trousseau phenomenon, in which the hand assumes the tetany position from a carpospasm, when pressure is put upon the upper arm, as in the measurement of the blood pressure and maintained at a pressure higher than that of the blood for several minutes The crucial test, however, lies in the determination of the galvanic excitability of the motor nerves intermediary metabolism in tetany has been extensively studied. It is known that calcium and magnesium ions are sedative and potassium and sodium ions irritative in their effect upon the nervous system It has been demonstrated that in tetany, there is a diminished quantity of calcium in the blood and in the nervous tissues, and it has also been demonstrated that the hyperexcitability of the nervous tissues can be made to disappear by the administration of calcium tany, too, there may be very marked variations in the acid-base equilibrium, either in the direction of acidosis or of alkalosis Indeed tetany may supervene in the alkalosis that can be caused in any normal individual by prolonged and deep breathing It has been further suggested from experimental analogies that there may be a relationship of tetany to the intoxication by xanthin or by guanidin bodies

Clinically, tetany is observed in cases where the parathyroids have been removed (tetania parathyreopraeva), in association with certain gastrointestinal disturbances (tetania gastrica), in association with pregnancy or the puerperium (tetania gravidarum, tetania lactantium), in association with the so-called spasmophile diathesis in children (tetania infantum), and in the so-called idiopathic tetany of workmen, common in epidemic form in certain cities in Europe. It has not, however, by any means been demonstrated that all these forms of tetany are actually related to the parathyroid glands. There is here an opportunity for study with the new active principle recently obtained from the parathyroids

Although we have no real knowledge of any states of hyperactivity of the parathyroids, there have been a very few cases that present interesting contrasts to the findings in tetany. A few years ago, Drs. Thomas and Wentworth of Clifton Springs showed us the records of such a case. This was in a young man, who during his life time, showed an arterial hypertension, arteriosclerosis, marked calcification, not only of the arterites but of the cartilages and fibrous tissues throughout the body, high calcium content of the blood, and, at autopsy, a marked hyperplasia of the parathyroid glands.

The Hypophysis Cerebri or Pituitary Body The hypophysis is a composite gland that may be divided into parts which are different in histology, in embryology and presumably in physiology Clinicians have been accustomed to divide diseases of the hypophysis as they do diseases of the thyroid into states of overactivity and states of un-

deractivity The state of overactivity (acromegaly) is well substantiated. We are now less certain about the so-called states of underactivity since it has been shown experimentally that the hypophysis may be removed without the production of these clinical pictures (adiposity, genital dystrophy, diabetes insipidus) and that they may all be produced experimentally by lesions in the nervous tissues adjacent to the hypophysis.

The anterior part of the hypophysis is of glandular histology with two different types of cells, the chromophile cells and the chromophobe cells. Adenomata developing from the former variety result in acromegaly. Those composed of the chromophobe cells do not show acromegaly but merely the signs and symptoms of hypophyseal tumor, together perhaps with some of the features that suggest a lack of secretion of the hypophysis. It is from the posterior portion, derived from the nervous system and composed chiefly of neuroglia and from the thin intermediary portion, that the active principle (pituitrin, hypophysin, pituitary liquid) so much used now as a pharmaceutical agent is derived

Acromegaly is a most interesting disease but fortunately a rare one Those who are especially interested will wish to read the splendid articles now being published from the Peter Bent Brigham Surgical Clinic in the analysis of a hundred cases observed during the past twelve The disease is a chronic one, beginning usually in the third decade and characterized by a marked bony overgrowth, involving the facial portion of the skull, the hands and feet, and indeed all the bones in the body There is also an increase of the soft parts with coarseness of the features to the point of marked deformity Gigantic stature of six feet or more is common Diminished libido sexualis and irregularity or complete lack of menstruation are common symp-There is an increase, usually, of the basal metabolic rate, though not to the same extent as in exophthalmic goitre Involvement of the skin is shown by its coarseness, by the large pores, by the increase of sweat and sebaceous material, and coarseness of the hair The growth of the pituitary tumor gives rise to enlargement of the sella turcica, headaches, drowsiness, failing vision and optic atrophy Asthenia and paraesthesias are Later in the disease there are evidences of enlargement of the viscera and widespread disturbances throughout the body, especially in the endocrine organs Glycosuria appeared in twenty-five per cent and diabetes mellitus in twelve per cent of the Boston series It is an interesting fact that all those patients belonged to the white race and that twenty one per cent were Jewish

Other clinical pictures have been found associated with different types of pituitary tumors as has already been indicated. In some of these cases, the contrast to acromegaly is quite evident We see in these two different states a very striking contrast of symptoms

By reason especially of the toxic effect exerted upon the cardiovascular system, upon the nervous system and upon the metabolism, exophthalmic goitre presents a striking and dramatic picture. The facial expression is one of fear, apprehension, The eyes are prominent, sometimes with marked protrusion, there is a peculiar restlessness, over-alertness and quickness of movement The patient may be thin, even to the point of emaciation, he may have lost weight rapidly, the basal metabolic rate is found to be decidedly in-The thyroid gland is moderately enlarged, vascular and pulsating, there may be a high degree of tachycardia, and after prolonged intoxication other evidences of damage to the heart muscle, in dilatation of the heart or auricular fibrillation with a continually irregular pulse There is a large appetite with wasting in spite of it and often a profuse watery diarrhea Among women patients amenorrhea is common The skin is thin, moist, soft and sweating may be profuse, the hair is apt to be fine and silky. In addition to the restlessness and apprehension there are among the nervous features the marked fine tremor that is so characteristic, insomnia that may be very troublesome, the numerous autonomic nervous signs and symptoms besides those already mentioned, and not infrequently mild psychic disturbances, with phobias or obsessions and even outspoken psychoses

The typical case of exophthalmic goitre will be rarely missed by any physician, but the milder, atypical cases, the so-called formes frustes may very readily be overlooked. The possibility of a mild hyperthyroid state should be considered in any case where there is a persistent tachycardia, rapid emaciation otherwise unexplained, watery diarrhea, excessive sweating, marked fine tremor or some of the characteristic eye signs. A consideration of other features of the case and a test of the basal metabolic rate may aid in establishing the diagnosis

On the other hand, and strikingly so, in cases of under-function of the thyroid gland there is a lack of the usual stimulation that the thyroid exerts upon the rest of the body Patients with myxedema show a mental dullness and torpor with slowness of thought and of movement, sunken eyes, narrow lid slits, a thickening and drying of the skin with lack of sweating, falling out of the hair, obesity, perhaps a rapid gain in weight, constipation, a marked slowing of the metabolic rate, a sensitiveness to cold in marked contrast to the sensitiveness to heat shown by so many hyperthyroid patients. In myxedema there may be a goitre or there may be an extremely small, scarcely palpable thyroid gland The puffiness of the eye lids, the thickness of the subcutaneous tissues (myxedema) may give rise to a suspicion of nephritis Autonomic reactions are

sluggish The temperature as well as the pulse rate may be subnormal and the blood pressure is usually low

The clinical picture of hypothyroidism is less dramatic than that of hyperthyroidism and is apparently much more often overlooked. Publications from some of the larger clinics of the country indicate that most of their patients with hypothyroidism have not been recognized as such before coming to the clinic. Features which should lead the physician to suspect the possibility of hypothyroidism are

- 1 In children keep in mind the following as suggestive
 - (a) Retarded growth
 - (b) Habitual constipation
 - (c) Dullness at school
- 2 In adults keep the following in mind as suggestive
 - (a) Persistent constipation
 - (b) Endogenous obesity
 - (c) Dry, harsh skin
 - (d) Subjective feelings of cold
 - (e) Recurring drowsiness in daytime
- 3 In doubtful cases try therapeutic test (thyroid feeding)

In sporadic cretinism or congenital myvedema due often to a thyro-aplasia although sometimes associated with a goitre, the symptoms may appear within a few months after birth tongue is large, month open and drolling, the lips cyanotic, there is obesity with coarsely wrinkled, thickened skin, sleepiness, retardation of growth, constipation, anaemia, pot belly and mental re-In older children, the failure of the tardation ossification centres to develop and persistent dwarfism are additional signs. It is well known that cases of cretinism and idiocy are much more commonly found in regions where endemic goitre is prevalent. This is an added incentive to the interest in the prophylaxis of endemic goitre by the use of small quantities of iodin

We have here no clear Parathyroid Glands cut distinction between cases illustrating hyperfunction and those indicating a hypofunction of There is a well defined clinical picthe glands ture associated with the complete removal of the parathyroid glands that we naturally attribute to a lack of function of these glands drome has for its presenting symptoms, attacks of intermittent tonic spasm in certain groups of muscles, particularly of the hands and feet (te-Such attacks may occur tania parathyreopraeva) spontaneously and then they are spoken of as manifest tetany Between the attacks, they may be brought out in a susceptible person by certain procedures and these procedures are tests of this so-called latent tetany Such hyperrritability of the peripheral nerves may be demonstrated by means of the Chvostek phenomenon, the twitching of the facial muscles on tapping the facial nerve,

childhood as a part of their religious cere-Castrated men are spoken of as eunuchs and they belong, as a rule, to one of two different types, the tall, thin type or the short, pudgy, fat type that resembles the dystrophia adiposo-genitalis of hypophyseal origin both types, the pelvis is broad, the skin smooth with a tendency to hypotrichosis and frequently with many fine wrinkles especially about the angles of the mouth that give to the patient a look of premature senility Eunuchs lack the aggression and courage of normal men but may retain a high degree of intelligence and of artistic ability In the tall type, the arms and legs are unusually long compared to the body height. Usually there is a complete loss of libido and potentia sexualis but libido may be retained to some extent and a modified potentia is rarely present

Not infrequently there are seen patients that resemble in many respects the eunuchs but that have small hypoplastic gonads. Such patients are spoken of as eunuchoids. Less is known about such conditions of hypogenitalism in the female sex, but in women we do see patients with hypoplastic internal genitalia with dysmenorrhoea or oligomenorrhoea and very frequently evidences of a constitutional inferiority of the nervous sys-

tem, such as migraine

Pancreatic Syndrome The discovery of insulin has strengthened the opinion that diabetes mellitus is due to a lack of function of the internal secretion of the pancreas or of the Islets of Langerhans that are scattered throughout that organ You are all familiar with the essential features of diabetes, with the inability of the body to handle the starches and sugars, with the occurrence of hyperglycaemia and glycosuria, the loss of this important source of food to the body, the rapid loss of weight, the polydipsia, polyphagia, and, in the absence of sufficient oxidation of glucose, the abnormal metabolism of fat that may lead to the poisoning of the body by the intermediary products of fat metabolism

LESS WELL DEFINED ENDOCRINE SYNDROMES

Even in the presence of obvious endocrine disturbance the special endocrine examination does not always reveal one of the clear cut clinical pictures outlined above There may be a great mixture of signs and symptoms, so that one is in grave doubt as to where the emphasis should be placed. It is true that one frequently finds in a classical endocrine syndrome, such as acromegaly or Addison's disease, evidences of the involvement of other ductless glands but in such cases the preponderance of the evidence is sufficient to make the classification clear In certain other cases one must be satisfied to give the impression of a multiglandular endocrinopathy, mentioning the glands that seem to be chiefly at fault

In some cases the special examination results in the impression that there is "no evidence of en-

docrine disorder" Still other impressions might read "mild endocrine involvement probably of no practical significance" or "marked autonomic nervous disturbance without evidence of endocrinopathy" For example, it is not unusual to find in both men and women of somewhat nervous temperament, who have worked too hard and played too little, a train of symptoms that has troubled them sufficiently to cause them to seek They may show fatigability, medical advice bradycardia, arterial hypotension, gastrointestinal symptoms with gastric hyperacidity, a spastic colon, perhaps with mucous colitis, all evidences of a disturbance in the autonomic nervous system, but there may be no other indication of an endocrinopathy

Then one may encounter peculiar clinical syndromes with associated endocrine disorders not apparently in etiological relationship but rather as coordinate or subordinate constitutional phe-One may find a mild endocrinopathy in a case of otherwise typical arterial hypertension but one is not therefore justified in assuming that the arterial hypertension is necessarily due to the endocrine feature Dercum's disease, adiposis dolorosa, is uniformly associated with some endocrine dyscrasia In some cases, the thyroid has seemed to be chiefly involved, in others, definite pituitary lesions were found. Lyon has insisted that the various lipomatoses can not be sharply distinguished from each other, that there are transition cases for instance between Dercum's disease and the diffuse symmetrical lipomatosis with which endocrine features are not regularly found A still more striking example to illustrate this point is found in the peculiar condition known as lipodystrophia progressiva, which in its full blown form presents the grotesque contrast of complete emaciation above the waist and obesity below the waist. A number of such cases have been described. One author describes in association with his case a thyroid disturbance, another some evidence of adrenal involvement, still another a gonadal disease, so that when one has an acquaintance with the literature of the subject, it is obvious that the endocrinopathies described could not have stood in etiological relationship with the lipodystrophia but were merely associated constitutional features Bauer has emphasized the fact that some of the physical traits often ascribed to the influence of the gonads are evident in the developing organism long before these glands could possibly have been This leads us naturally to a general consideration of the constitution and while no one can claim that the endocrine glands are the sole determiners of constitutional traits, yet one must keep in mind the strong probability of their great importance in constitutional pathology

THE CONSTITUTION

Practitioners of medicine have always been in-

in the moderately retarded basal metabolic rate, a tendency to obesity, a smoothness and softness of the skin and a type of infantilism especially marked in the genital sphere. When such cases appear before the age of puberty a typical Frohlich syndrome results. In these cases we have

Symptoms directly due to the brain tumor

(a) General symptoms of intracranial pressure headache, mental disturbance, vomiting, etc

 (b) Neighborhood symptoms due to local pressure—visual disturbances, bitemporal hemianopsia, optic atrophy,

changes in the sella turcica

2 Symptoms referable to loss of function of the hypophysis — adiposity, increased carbohydrate tolerance, genital dystrophy, polyuria, trophic changes, involvement of other endocrine glands

The Supi arenal Glands In the suprarenal or adrenal glands we have again composite structures with two distinct parts, differing from each other in their anatomy, embryology and physiology. The medulla of the adrenal is closely related to the sympathetic nervous system and is a part of the chromaffin tissue of the body. From this part is derived the potent drug, epinephrin or adrenalin, on the other hand, the cortex is a part of the interrenal tissue, closely related to the sex organs, and is the portion of the adrenal that is essential to life

The lesions of Addison's disease, as a rule, involve the entire suprarenal gland and hence this disease is generally considered to be due to an underfunction of the gland as a whole well recognized syndrome, a chronic, progressive, fatal disease that is fortunately not very common Its chief features are the marked asthenia, the bronzing of the skin, the gastrointestinal disturbances, the very low blood pressure, with perhaps a general vascular hypoplasia. The spleen is often enlarged and perhaps lymphatic struc-Anaemia of a secondary type tures generally The basal metabolic is an outstanding feature rate may be retarded The pathological lesions in Addison's disease are usually tuberculous caseation of the adrenalin glands or syphilitic disease It is generally believed that these of the glands lesions do not develop in persons who have not already a constitutional hypoplasia of these structures

Less sharply defined clinical pictures have been described as due to a hypoadrenia in view of the asthenia, low blood pressure and gastrointestinal disturbances. It is difficult to be sure whether these cases are due to a disease or defect of the adrenal glands or to disturbance of the autonomic nervous system independently of the chromaffin tiesure.

It is not definitely known whether there are states of overfunction of the chromaffin system

Under this heading, there are described cases that resemble the hyperthyroidism of Graves' disease but that do not respond to iodin therapy and are not improved by thyroidectomy

States of overfunction of the interrenal tissue or cortical portion of the adrenal gland are interesting, but rare, conditions. They are illustrated chiefly by abnormalities in the sexual sphere. It is believed that when the process begins in intrauterine life, a faulty development occurs with the formation of a pseudo-hermaphrodite with the gonads of one sex and the external genitalia of the opposite sex. Young women who masquerade successfully as men are usually of this type. We saw one case where the patient was raised as a boy and sent to a boy's school, but when later operated upon for undescended testes, it was found that this boy was really a girl with ovaries and an infantile uterus.

When the hyperinterrenopathy occurs in child-hood, precocious puberty may develop. A boy of six may show well developed external gentalia and the trichosis of an adult and exhibit the usual instincts and sexual functions of an adult. Similarly, quite young girls may show well developed secondary characters and may menstruate more or less regularly

When the condition occurs during adult life in women there is usually at first menstrual irregularity, a gradual increase in the trichosis of the body, till it becomes hetero-sexual in character and an assumption in general of male characters and traits. Such patients are said to exhibit virilism and hirsutismus

Lesions of the interrenal tissue encountered in such cases may be adenomata, a marked hyperplasia of the cortical cells, or even large hypernephromata. Other important clinical features in young people are rapid growth and marked increase in fat. In older women the process may go on to destruction of the suprarenal glands with evidences of insufficiently of these organs.

The Gonads Clinical pictures due to states of overfunction of the gonads are usually related to disturbances in the interrenal tissue like those mentioned above States of underfunction of the gonads differ somewhat in the two sexes women we are familiar with the changes that occur at the natural menopause, with the tendency to obesity due to a lack of physical activity as claimed by some investigators or perhaps to a real metabolic retardation. There are, of course, the cessation of menstruation and the disturbances of the nervous system, particularly of the autonomic portion Somewhat similar clinical pictures often ensue after an artificial menopause has been induced

The state of underfunction of the gonads in males has been very thoroughly studied, especially by German clinicians, among the Skopzi, a religious sect in Central Europe Among these people castration is often performed during

SOME ABDOMINAL DISEASES FROM THE GENERAL PRACTITIONER'S VIEW-POINT*

By JOHN B DEAVER, MD, PHILADELPHIA, PA.

HAVE selected the above title because I thought I may be able to offer some useful suggestions to the general practitioner before proceeding, it is a great pleasure to me to say that in a fairly large consultation practice I generally find that the doctor in attendance has a good grasp of the situation, from the viewpoint both of diagnosis and treatment. It is my custom always to inquire of the doctor how he has reached his conclusion and rarely do I have occasion to disagree with him. If there is any discussion it is usually as to the opportune time This applies particularly to acute for surgery abdominal diseases, especially the more common ones, such as appendicitis, cholecystitis, acute perforating ulcer and intestinal obstruction

The appendix and the gallbladder, as we know are also the most common sites of chronic abdominal conditions and to these may be added duodenal and gastric ulcer and visceroptosis

I shall confine my discussion to these more common conditions Although, as I have already said, the general practitioner usually correctly approaches the diagnosis before the consultation takes place there are occasions when he is confronted with an obscure or atypical set of symptoms which may well baffle his diagnostic acumen Strange to say this happens as often in so common a condition as acute appendicitis as in any of the less frequent abdominal disorders have repeatedly pointed out, the confusion or if you prefer, the uncertainty is mainly due to the anomalous position which the appendix may oc-This point I have emphasized on numerous occasions, nevertheless I feel justified in again calling attention to the role played by the position of the appendix in the diagnosis of appendicitis

The position of the appendix in about 70 percent of the cases is behind the cecum or behind and to the outer side of the cecum and the colon In about 25 percent it is in a pelvic position, and in the remaining five percent it lies beneath the terminal ileum and the mesentery and points to the left either upward or downward, or above the terminal ileum when it points to the left and upward, very rarely it may lie medial to the cecum and the colon Any of these positions may be fairly well determined by gently palpating the abdominal wall with the tips of the index and middle finger, the palpation being directed from the point corresponding to the base of the appendix, ie, the junction of the lateral and intermediate thirds of a line extending from the anterior superior spine of the ileum to the umbilicus

These are practical points that should be borne in mind by the general practitioner and should

*Read before Lake Keuka Medical and Surgical Association, Lake Keuka, N Y, July 14, 1927 be added to his viewpoint with regard to surgical diseases of the abdomen. They sufficiently account for the confusion of symptoms presented by what finally resolves itself into an acute appendicuts.

It will be readily seen that with an appendix directed upward or upward and lateralward, and lying behind or lateral to the cecum or colon, the local manifestations of suppuration may be in the loin and simulate renal abscess I have seen fecal fistula follow a retro-colic appendiceal abscess which pointed in the loin. If the inflamed appendix holds a pelvic position it can simulate tubo-ovarian disease (in the female), while in either sex it may suggest diverticulitis of the sigmoid, the pain usually is referred to the left side, and vesical symptoms will be complained of This suggests, in fact, makes obligatory digital examination through the rectum or vagina or both

Vesical symptoms in pelvic appendicitis are caused by involvement of the peritoneum covering the upper posterior surface of the bladder, when the appendix adheres to the bladder, and when the appendiceal abscess is in relation to the bladder Evacuation of an appendiceal abscess into the bladder and drainage through the urethra has been known to occur, resulting in Dr W W Keen an urethral fecal fistula reported such a case some years ago in which I made a cystoscopic examination and was able to reveal the fistulous opening in the bladder site of an appendiceal abscess then depends upon the position, the length of the appendix, and whether the terminal portion of the appendix or the base is the site of a perforation or the point of greatest inflammation

Both the general practitioner and the surgeon are often perplexed in arriving at a correct diagnosis in cases where the appendix is abnormally long, occupies a high position and its terminal portion is inflamed. In such cases the symptoms often suggest gallbladder trouble, and frequently also other conditions such as pyelitis, Dietl's crisis, subacute perforating duodenal ulcer or subacute or even acute pancreatitis when the inflammation of the appendix is a fulminating one In these cases the actual diagnosis is most often made at the operating table. One of the surprises of acute appendicitis is when perforation occurs at its base, close to its junction with the cecum, making the condition equivalent to a perforated cecum giving rise to a syndrome of symptoms and signs so closely simulating acute perforated duodenal ulcer that often only opening the abomen will reveal the diagnosis

The question of abdominal rigidity, by the way, is one that often may be misleading to the doctor Boardlike rigidity is present only in the stage of a

terested in their patients' constitutions, particularly in their bearing upon predisposition to disease. A great deal more was thought and said about the constitution in the days before the advent of bacteriology than there was in the following decades when men's attention was fixed almost exclusively upon the study of bacteria and other extraneous sources of disease

But there is now evidence of a recrudescence of interest in the constitution inaugurated by the psychiatrists and taken up by the internists of Europe and more recently of America

With the change in the trend of biological research from the study of the origin of the species (evolution) in the preceding century to that of the origin of the individual (heredity and development) in the present century, a scientific basis for a constitutional pathology is becoming apparent Biologists teach us that the general principles of heredity and development that have been and are being established through animal experiment are broadly applicable to man and may be used as foundations for medical studies From these experiments we learn that the fully developed organism (phenotype), in this case the realized adult person, is the resultant of a long series of interactions between the zygote (the fertilized ovum, genotype) and its environment that the "determination factors" (ids, genes) of development are contained within the germ and that the "realization factors" of development lie in the environment, that both factors are necessary for development, which is, however, governed mainly by heredity

Professor Conkin explains graphically by his figure of the shuffle and deal of the chromosomes the almost infinite possibilities of hereditary differences. Considerable variation in human beings is, of course, compatible with health, though each variation may be associated with some special predisposition to disease, and it is reasonable to believe that the study of such individual variants may lead to the development of special, as contrasted with general, prophylaxis. Such variants may manifest themselves by morphological distinctions, by physiological differences, by differences in the evolution or involution of development, etc.

Experimental studies on the influence of endocrine products upon growth in early stages of the development of certain larvae and clinical observation of the effect of endocrinopathies upon the physical and mental development of human beings make it seem probable that, in the developmental processes of both normal and abnormal phenotypes, the internal secretions may play an important role. It seems possible, as Barker has said, that the genes, or determiners, of hereditary characters may, to some extent, at least, operate through the mediation of the endocrine glands in the production of varieties among

phenotypes, including perhaps those pathological variants that fall victims to disease the etiology of which seems at present quite obscure. It is certain that the role of the internal secretions must be strongly considered in any systematized study of the pathology of constitution. It has been pointed out that the diseases of the endocrine organs, especially those that develop insidiously and give rise to the classical endocrine syndromes, appear to be usually of endogenous rather than of exogenous origin, that is to say, they develop as the result of special anomalies of constitution Endocrinopathies tend to run in families and perhaps inter-relationships between the glands may account for the fact that all the cases in one family need not be of the same general type. It is interesting that in the Boston statistics of acromegaly, twenty-one per cent of their patients were Jews Diabetes is another endocrinopathy to which that race seems particularly prone

ORGANOTHERAPY

Of the great number of endocrine products on the market, those of known potency in substitution therapy are (1) thyroid and thyroin, (2) insulin, (3) parathyrin (Collip)

Of known potency as pharmacodynamic agents in conditions other than those due to disturbance of the glands in question are products of the medulla of the adrenal gland (epinephrin, adrenalin) and products obtained from the posterior lobe of the pituitary gland (pituitrin, pituitary liquid, hypophysin)

There are very favorable reports of other potent agents developed in animal experimentation. One of these is from Evans, Smith and their associates at the University of California, who have secured an extract of the anterior lobe of the hypophysis which is protein free and sterile and which has caused a marked gigantism in rats when injected intraperitoneally. Allen and Doisy of St. Louis have demonstrated an ovarian hormone from the liquor folliculi of hog ovaries

present in the common duct unless of course, jaundice and its concomitant acholic stools and dark urine are added to the picture. Jaundice indicates obstruction of the common duct as a rule due to stone or stones, although other factors such as cholangitis, tumor, or constriction may be the cause.

While the clinical diagnosis of chronic cholecystitis is made with comparative ease, there are times when an appendix in a high position will here also afford an element of doubt that, but gastric symptoms, such as pylorospasm are frequently due to a cholelithiasis In fact, a gastric or duodenal lesion may often result as secondary phenomena to infection of the biliary The combination of ulcer and cholecystitis is sufficiently common to confirm this fact In making the diagnosis it is well to remember that in the earliest stage of cholelithiasis the gastric symptoms predominate and the pain is usually more of a dull ache, confined to the epigastrium or possibly referred to the back. It may occur at any time, day or night, and as a rule shows a relation to the type of food rather than the time of intake. Here, as in nearly all abdominal diseases I lay much stress on the physical examination There is usually a tender spot about two and a half centimeters above the umbilicus and in a line between it and the right costal mar-This is almost as constant as the McBurney point of tenderness in chronic appendicitis can be elicited by thumb pressure under the ninth costal cartilage. In the more advanced stage the enlarged gallbladder can be felt, most easily by bimanual palpation. In patients who complain most of back pain, pressure over the gallbladder will aggravate it, or if the pain is absent at the time of examination the pressure will produce it

In the treatment of chromic cholecystitis nonsurgical drainage as I have already indicated, is a favorite measure. It has its uses and its limitations. The latter are indicated by the large number of cases that finally come to operation after more or less prolonged treatment has proved unavailing. In many instances the prolonged effects of infection from the presence of gallstones are seen in the complicated pathology presented at operation—pericholecystic adhesions, cholangitis, biliary cirrhosis, pancreatitis. The inference is plain and needs no further elucidation

A frequent acute abdominal crisis with which the general practitioner is confronted is perforated duodenal or gastric ulcer. It is not usually possible, nor is it necessary, to differentiate the two as both are such urgent surgical conditions that the important thing to do is to recognize that perforation has taken place, and to bring the patient to the operating table at the earliest possible moment. It is well known that operation within the first few hours after the rupture has taken place is, with few exceptions, successful. It is well if an ulcer history can be obtained, but as a

rule the patients are too sick to give any history at all until after recovery from the operation when the history can be obtained for the completion of the hospital record All that is necessary to know before operation is that a person in apparently good health has been suddenly stricken by a "knock out" acute abdominal pain immediately followed by board-like rigidity. This is so typical that the diagnosis can be made by any interne after he has seen a single case probably no type of acute and serious abdominal crisis in which operative results are more satisfactory, than in these cases of perforated peptic ulcer, provided they are seen and treated in the The late cases, on the other hand, early stage are among the most unsatisfactory ones, so that it is important for the general practitioner to adjust his viewpoint to recognize the imperative necessity for early surgery when the intra-abdominal cavity is still sterile, and to forego the satisfaction, to him, of an exact differential preopera-This applies with even greater tive diagnosis force to acute perforating marginal ulcer, because of the more extensive surgery required, and thus all the more demands the presence of a sterile field

With regard to acute perforating peptic ulcer, there is generally little difference in the viewpoint of the practitioner and the surgeon But with regard to chronic ulcer, it may be said that their respective attitudes clash more often than they The arguments of each side occupy much of the attention of medical and surgical meetings and fill the pages of our medical journals source of controversy, it reminds me of the story of the small boy aged four, whose father is a surgeon and his mother a doctor, actively interested in research work Little Bobby had been taken to the Zoo and was talking so much about his experiences that he often neglected to eat his food Finally one morning his mother said to him, "I wish you would eat your breakfast and stop talking about the Zoo" Young hopeful replied, "If I didn't talk about the Zoo, I wonder what there would be to talk about in this house except hospitals and operations?" What would we do for controversy without peptic ulcer?

While the diagnosis of duodenal ulcer is not very difficult, that of gastric ulcer is not so easily made. Gastric ulcer is diagnosed more often than it actually occurs. You are no doubt familiar with Sir Berkeley Moynihan's saying, "most gastric ulcers can be found in the appendix," to which statement I heartly subscribe

The X-ray demonstration of ulcer can usually be relied upon, but a negative result, when ulcer signs and symptoms are present, should not be taken too literally, and occasionally the positive demonstration of a filling defect indicative of ulcer has not been supported at operation. However, the question hinges on treatment. Here, more than in other abdominal diseases the advan-

high degree of peritoneal irritation, before an actual full-fledged peritonitis has developed the advanced stage of peritonitis, when distension occurs, the rigidity becomes less pronounced passing it may also be said that circumscribed or diffused rigidity is always significant of an intraperitoneal or rather an intra-abdominal lesion, usually an acutely inflamed perforating appendix or a ruptured viscus, and occasionally injuries of the chest wall and inflammatory disease of the pleura and lung. In abdominal injuries, for example, where the blood picture fails to show the presence of hemorrhage and the abdomen is rigid, it is a pretty safe guess to diagnose rupture of a Only recently I had one of many such experiences and insisted upon opening the abdomen, my guess proved to be a certainty

But let us return to our discussion den acute onset of appendicitis with the pain at first generalized and then localized to the right lower abdominal quadrant is so familiar that even the layman often makes the diagnosis doctor, however, the matter is not so simple when the pain shifts from the periumbilical or the epigastric region to both sides of the lower abdomen and is more marked on the left, with bilateral rigidity present. This indicates a pelvic appendicitis If the patient is seen early the position of the appendix can be determined by deep pressure low down over the abdomen lateral to the right rectus muscle and directed downward and to the Failure to properly interpret these symptoms and signs has done much to add to the shockingly high mortality of acute appendicitis

I wonder how often the general practitioner makes the diagnosis of acute non-calculous cholecystitis To my mind this is as often a matter of luck as of actual diagnostic acumen While it is the ubiquitous appendix that is most apt to befog the picture, such confusion is also caused when the patient is seen several hours after the onset of symptoms and there is a right-sided peritoneal irritation or peritonitis that prevents satisfactory palpation, except for the detection of more or less diffused tenderness, according to the degree of

peritoneal involvement

In fact, it is in the presence of peritonitis with distension that physical findings are proportionately unsatisfactory From the viewpoint of the diagnostician, and I may add more particularly the surgeon, this is the strongest argument for early consultation By unsatisfactory examination I mean mainly the impossibility of ascertaining the point or area of greatest tenderness usually corresponds to the site of origin of the pathology, and where a mass or swelling is usu-The sense of touch is a great asset ally present and when handicapped by a more or less advanced peritonitis, there is an almost insurmountable difficulty to an exact diagnosis In my own experience I have frequently to confess that I cannot say what is wrong, especially if the next

reliable factor, the history, proves unreliable, which it so often does In acute uncomplicated cholecystitis it is almost impossible to make a differential diagnosis especially from an appendicitis in a high position, by physical examination alone where there is a wide area of circumscribed peritonitis and the history is indefinite cases a few hours or more of complete functional and anatonuc rest, gastric lavage, ice to the inflamed area, proctoclysis and morphia to control the pain and the hyperperistalsis, usually will lead to localization, and then by gentle manipulation it may be possible to palpate an inflamed gallbladder or a small appendiceal abscess. Where acute cholecystitis has advanced to the stage of phlegmon, gangrene or perforation, it is idle to attempt to differentiate the type of pathology The best we can do is to to direct our attention to saving the life of the patient and let the open abdo-

men reveal the cause of the trouble

Cholecystitis associated with calculi is a differ-Here the symptoms are more disent matter tinctive or pathognomonic of a lesion in the gallbladder Indeed, it is scarcely necessary to outline the picture, as each and every one of you is lamiliar with this ailment which ranks second to appendicitis in abdominal disease. The gallbladder and its rather close neighbor the appendix, are dependent upon free drainage for their func-When in the presence of intional well-being fection or a stone or stones that block the cystic duct, the interference with drainage sets the fire going in the gallbladder and when the appendix is blocked by fecal stasis or a fecal concretion it becomes red hot and inflamed In other words, dramage acts like a motor meter, masmuch as when it is reduced it sends the red line up to the danger point

It may be in order here to say a word in regard to a different kind of drainage of the gallbladder, -that is, non-surgical drainage This procedure, I am free to say, has made for itself a place in medical therapeutics and no doubt justly 50, with certain reservations Its principal limitation, I should say, would be where an obstruction to free drainage of bile is definitely due to stone formation I am free to say also that I consider it unwise if not unjust to subject such a patient to the loss of time and money which the prolonged treatment entails I will admit, however, that the method may be of some use as a preoperative measure in bringing the patient's condition up to a stage where operation may be less of a risk But it does not cure calculous cholecystitis

In chronic disease of the gallbladder the symptoms are usually clear enough to point to the site of the lesson, and with the aid of the dye test and the cystographic demonstration of the organ we now have quite a reliable diagnostic adjunct But even so it is not always possible to tell beforehand whether or not the real trouble is in the gallbladder and whether or not an obstruction is

frequent complications and sequelae of the influenza epidemics, to focus attention upon the differential diagnosis of tuberculous and non-tuberculous lung infection

What has become known as broncho-pulmonary suppuration is a non-tuberculous infection involving both the bronchi and lung parenchyma, but for the sake of discussion it is far simpler to consider the two separately, as bronchiectasis and lung abscess

In bronchiectasis the dilatation of the bronchus may be cylindrical or saccular in shape and be very small or attain to large dimensions. The cylindrical type constitutes a dilatation of the entire bronchial wall and often affects the larger trunks, while the saccular type may be found as a dilatation of the terminal bronchi or be on the side of the wall as a sacculated aneurysmal process.

The disease may be limited to a small portion of one lobe, may involve the whole lobe or may be present in extensive areas of one or both lungs

Except when occurring in chronic tuberculosis, the disease is much more frequent in the lower lobes

Accompanying bronchiectasis there are constantly present changes in the bronchial wall and the surrounding lung structure, infiltration, fibrosis or interstitial pneumonia. Ulceration of the bronchial mucosa is a common occurrence and gives rise to the hemorrhage so frequently encountered. Perforation of the bronchial wall produces a lung abscess or, if located near the periphery, an empyema results

No age is exempt from either condition and numerous instances of congenital bronchiectasis are reported in the literature

The causes of bronchiectasis are those which act from within the bronchus and those acting from without or as expressed by Fowler and Godlee, the intrinsic and the extrinsic causes. Of those acting within the bronchus, more of our cases have followed infection of the paranasal sinuses, with its attendant chronic bronchitis, than any other single condition. Next in frequency comes measles and whooping cough in childhood. Another but less frequent intrinsic cause is the aspiration of blood and infective material during operations on the upper respiratory tract.

A foreign body in the lumen of a bronchus is a not infrequent cause. Many are expelled spontaneously after a longer or shorter sojourn or, on the other hand, a foreign body may remain many months and greater or less damage result

Of the extrinsic causes traction or pressure from fibrosis following pneumonia, probably broncho in type, has been present in the larger percent of our cases. However, this is also seen following lung abscess, chest injuries, aneurysm, enlarged bronchial glands, new growths and pro-

longed compression of the lung by intra pleural

Probably it is most often a combination of the two processes acting together—the intrinsic and the extrinsic—which bring about the necessary changes in the wall of the bronchus with the inflammation of the mucous membrane, the retention of secretion and the accompanying cough acting with expansile force which produces the dilatation

Lung abscess is essentially an infection of the parenchyma of the lung. It may consist of a single pocket of pus or multiple single abscesses or there may be multiple communicating abscesses. They vary in size from microscopic lesions to enormous collections of pus—one which we have under treatment at present was approximately 3 x 5 inches in extent.

The abscess usually ruptures either into a bronchus when it may evacuate and a spontaneous cure result. If the drainage is not sufficient the abscess goes on to the chronic stage. Should the abscess rupture through the periphery of the lung there occurs an empyema

Both bronchiectasis and lung abscess may be either acute or chronic and in the chronic cases the two very frequently occur together, the one

giving rise to the other

The symptoms of bronchectasis and lung abscess are much alike—both are characterized by cough accompanied by copious expectoration. In the former the odor gradually becomes foul, while in the latter the rupture of the abscess into a bronchus is immediately attended by the expectoration of foul smelling, heavy pus, frequently in large amount.

The onset of bronchiectasis, as a rule, is gradual and usually one obtains the history of many attacks of winter cough, frequently beginning after some acute respiratory infection, but attended by improvement during the warm weather Gradually, however, the cough and sputum increase and the improvement becomes less marked until infection with the anerobic organisms occurs, when the foul odor appears and the cough and sputum become more or less continuous

The occurrence of blood streaked sputum is common in either condition and a frank hemoptysis, frequently of large amount, is not unusual Vinson of the Mayo Clinic reports a study of 100 cases each of tuberculosis, bronchiectasis and mitral stenosis with the following incidence of hemoptysis

Tuberculosis .29, 11 slight, 15 moderate, 3 severe.

Bronchiectasis 49, 20 slight, 15 moderate, 9 severe, 5 very severe.

Mitral Stenosis 18, 10 slight, 5 moderate, 2 severe, 1 very severe

(Case No 5, fatal hemoptysis)

The two clinical pictures differ considerably

tage of medical treatment of duodenal ulcer lies in bettering conditions for operation For strange as it may seem, the operative results are better in the long-standing cases than in the earlier ones But the risk, especially in gastric ulcer, is a great A recent distressing experience sadly emphasizes this point A young woman, 32 years of age, came under my care after a number of years of medical treatment for periodic attacks of digestive trouble, highly suggestive of ulcer tion revealed a cancer at the pylorus with involvement of the gastric glands, etc. Although there is a family history of cancer in this case, I am strongly inclined to believe that malignancy could have been forestalled by early surgery The subject is really too large for more than this short reference to it at this time

Acute intestinal obstruction is easily recogmized, especially when it is associated with a history of a previous operation But even when it occurs as a primary duodenitis its signs and symptoms are unmistakable and I believe that in either type the viewpoint of the physician generally is that of the surgeon also. In both types the crucial point is the history First it is important to know whether there have been any previous attacks, and next how the attack began intermittent pain followed by nausea, progressively increasing vomiting, complete failure to pass flatus and to move the bowels, the presence of coils of bowel visible upon inspection, will suggest the diagnosis and physical examination will Auscultation will detect loud perisconfirm it talsis coming and going in waves, each wave causing an active cramp-like pain Palpation between the paroxysms of pain will provoke the stormy peristaltic wave and the concomitant pain The patient often points to the site of pain which is frequently found to be the site of obstruction Although this sign is by no means a constant one, it works often enough, to be taken into considera-Surgery is of course, the only possible relief, but its mortality still remains high

No apology is needed for including visceroptosis in this discussion. It is so purely a medical condition that it has more than its proper place in this endeavor to present some diseases of the abdomen from the standpoint of the general practitioner. Unfortunately some practitioners insist upon surgical treatment for this disorder. All that I cay say is that with all due respect to the various ingenious operations that have been

devised for the correction of ptosis, I have never been impressed with the results Personally, I consider it a non-operative condition, in practically all instances

The diagnosis of visceroptosis can usually be made upon the history and the appearance of the patient and confirmed by physical examination ach or colon, or both The history is that of extreme nervousness, considerable mental depression, marked fatigue on slight exertion, pronounced constipation, frequently also a mucous colitis and epigastric distress which may suggest gallbladder disease, chronic pancreatitis or peptic One must therefore be on the alert not to yield too readily to the patient's demand for oper-In the more aggravated cases the fluoroscopic diagnosis is perfectly reliable, but in the milder ones, it does not always demonstrate the condition and it is in these particularly that skillful palpation, percussion, and auscultation will reveal the ptosed stomach with its splashing sounds, the transverse colon lower than normal, and the mobile splashing cecum, as well as movable kidney or kidneys, and oftentimes the posteriorly displaced and partially prolapsed uterus When the diagnosis has been made, the treatment that I have found most effective is postural and The patient is advised to take plenty of dietetic rest, to sleep with the foot of the bed elevated at least three feet, daily abdominal massage, the movements to be made from the pubic bone upward, to increase the weight by forced feeding of highly nutritious food, regulation of the bowels by one or other of the mineral oil preparations, and to wear abdominal support adjusted under the fluoroscope The belt should be put on in bed before the patient gets up, should be worn continuously and taken off after the patient is in Readjustment of the belt will be required from time to time as circumstances indicate. At best the progress toward a cure is a slow one but it is usually a sure one Sometimes the marked abdominal pain or discomfort complained of is due to the soreness caused by the mobile cecum This is corrected by the belt Oftentimes, however, the condition is associated with a chronically diseased appendix. In such instances removal The incision of the appendix will be indicated should be made somewhat higher than usual in order to avoid subsequent pressure upon the scar by the suprapubic pad of the abdominal support

BRONCHO-PULMONARY SUPPURATION FROM THE MEDICAL STANDPOINT* By JOHN J LLOYD, MD, ROCHESTER, N Y

THE antituberculosis campaign which began about a quarter century ago, stimulated tremendous interest in the early diagnosis and

*Read before the Keuka Lake Medical and Surgical Association, Lake Keuka, N Y, July 15, 1927

freatment of pulmonary tuberculosis. The result in countless instances was that pulmonary disease of every description was labeled and treated as tuberculosis. It required the urgent need of men which the world war brought about and the method, in certain cases, has a very definite field of usefulness and that it must be included unruptured lung abscess, centrally located, it has been successful in one case reported below Case No 4) and there are many good results reported by Tewkesbury and others

In the runtured abscess, if located near the hilum, it offers a possibility of closing the cavity, provided the walls are not too rigid (See Case

No 5)

In bronchiectasis centrally located and of not too long duration, it offers a means of temporary relief at least. (See Case No 3) I can see no good reason why permanent results should not ensue, provided the walls of the bronchi can be compressed sufficiently to prevent the accumulation of secretion and the compression does not produce a constriction of the lumen above the affected area

The cases suitable for artificial pneumothorax constitute only a very small percent and great care must be used in their selection The disease must be confined to one lung and no case is suitable in which the lesions are near the periphery the lesion is peripheral, there are probably present adhesions to prevent successful collapse and, in the second place, should one succeed in producing a collapse there is too much danger of a focus rupturing into the pneumothorax cavity with the production of a dangerously extensive infection of the pleural cavity

This latter accident occurred in one of our series not reported below and after a stormy three or four months, she is now not quite as well as

when the pneumothorax was begun

There is always the danger of a serious or fatal This applies more especially to air embolism the initial fill, but is possible during any refill Fortunately I have seen this accident only once in sixteen years, but once is enough

The compression must be continued for months, just how many I am not yet in a position to say and for this reason the treatment is suitable only to those who are willing to cooperate as long as

One of our cases, (See Case No 4) has been collapsed for fifteen months, is free of symptoms and leading an active life The only inconvenience is to have a refill every two weeks. We expect to keep her lung collapsed for two years, then let it expand gradually and watch develop-

The cases cited below are those who have either responded to so-called medical treatment as outlined above or who have been treated by artificial pneumothorax

Case No 1-FVI, Antrum Chronic middle lobe right First seen April 9, 1926 Occupation, Teacher Single

Family History Father died TBC when patient was 21/2 years old

Past History Acute Bright's at 19 Duodenal

ulcer, operated in 1916 1916-1917 colon infection in bladder 1922, grip, cough continued in spite of throat treatments Severe metrorrhagia following grip in 1922

Present Illness Cough very severe, large Unable to go out anywhere. amount of sputum Right middle lobe feeble breath sounds and many

moist rales persisting after cough

X-Rav Very heavy trunks lower part right Lipiodol intra laryngeal syringe, showed bronchi apparently within normal limits antrum very cloudy and pus found upon irriga-Following lipiodol at weekly intervals, five doses, and frequent antrum washings, cough gradually decreased until at present cough is slight and is in excellent health

Case No 2-K D, Pneumonia Bronchiecta-

Female sis right lower Age, 16

Admitted to Rochester General Hospital, Feb. 23, 1927 Discharged March 24, 1927

Past History None of usual childhood diseases Flu in 1918, in bed two weeks and felt badly for 3-4 weeks longer Had moderate cough at this time Pneumonia in February, 1926, St Mary's Hospital three weeks, at home in bed 5-6 weeks longer Has always had many colds and occasionally sore throat until T & A in 1923 tured clavicle and scapula three years ago

Present Illness Only complaint is cough with sputum, which has been constantly present since pneumonia in 1926 Sputum has increased in amount, cough is much less troublesome at night, small amount of sputum, but now raising all during the day, approximately ½ cup sputum, the amount varies from day to day, sputum yellowish, somewhat foul Is slightly short of breath on In the lower right there are numerous moist rales, increased whisper and slightly prolonged expiration No evidence of disease of the accessory sinuses

X-Ray Left lung normal Bronchial trunks very heavy in lower right. Bronchoscopic examination showed no evidence of foreign body Large amount of heavy pus from lower trunks on the right.

Lipiodol injected through bronchoscope, showed a large number of saccular bronchiectases

lower right, on X-Ray

June 30, 1927, Resting past two months and using postural drainage Gained ten pounds Sputum has reduced to from 20 to 30 CC and very little odor present. Feels much better than for several years

Case No 3 -Mrs T E, Foreign body Bron-

Cricothy roid Lipiodol

First seen, March 30, 1926 Age, 41 Married, 6 children, OK.

Past History Many acute illness but made good recovery from each In September, 1925, swallowed a slivver of bone, which lodged in throat and three days later, in a violent paroxysm, was expelled Four days later pneumonia develwhen first seen—usually in bronchiectasis there is a history of long duration, the chief complaint being the troublesome cough and profuse, frequently foul sputum. There is generally very little curtailment of the activity of the patient.

On the other hand, in lung abscess we most frequently have the history of acute onset twelve days following tonsillectomy or other operation, or 2 or 3 weeks after a pneumonia. The patient is acutely ill, prostrated, has considerable rise of fever and rapid pulse and the cough is usually brassy in type, occurring in paroxysms. Until the abscess ruptures into a bronchus, there is very little if any sputum. After this occurs, provided the drainage be good, the toxemia gradually diminishes and the picture becomes practically that of bronchiectasis described above.

Dysphoea on exertion is common in both conditions, particularly in the early toxic stage and again in the late stage after considerable fibrosis has occurred

The physical signs depend upon the location and extent of the lesion. If centrally located there may be very few signs of disease present, but if the lesion be near the periphery, one often finds evidence of consolidation or cavitation or both. Usually in bronchiectasis, rules are more numerous and extensive than in abscess. It is at times astonishing to examine a patient with the history of broncho-pulmonary suppuration and find practically nothing in the lungs. The sputum should, of course, be studied for organisms many times in order to rule out tuberculosis.

Bronchoscopic study of selected cases gives most valuable information. This is especially true in children when lipiodol is to be used or in any case when one suspects the presence of a foreign body or a stricture in the bronchus

The X-Ray study of the lungs is indespensable in arriving at a correct diagnosis and since iodized oil has come into use, many previously doubtful cases have been shown in their true light

The most frequent complications arising during the course of broncho-pulmonary suppuration are hemoptysis, which may occur at any stage of the disease and is often serious, recurrent pneumonias, perhaps bronchogenic in origin are fairly frequent and always serious, meningitis and brain abscess, metastatic in origin, are practically universally fatal. Amyloid disease following prolonged suppuration probably occurs fairly frequently

Strictly speaking there is neither an adequate medical or surgical treatment for these conditions, but each case should be studied by a group of doctors and treatment either medical or surgical instituted as becomes indicated. Few cases are alike in response to the various measures in use and each one must be handled individually if suc-

cess is to follow

However, there are some very definite indications for all cases, viz

• 1st Rest in bed saves the patient unnecessary expenditure of energy, lessens the absorption from suppurative foci and puts less work upon the heart and lungs. Rest in bed should be insisted upon if the patient has any evidence of toxemia.

2nd In bed he requires fewer calories for existence and therefore the food intake is proportionately greater at rest than when active. Extra food helps build up his fighting powers and are needed in the long struggle back to health

3rd Limitation of the cough is most desirable as it is one of the prime causative factors in enlarging the cavities of bronchiectasis or abscess and is also responsible for bronchogenic spread of the suppurative process into normal regions of the lungs. Postural drainage should be attempted in all cases and when successful should be used frequently enough and long enough to prevent most of the coughing. (See sputum chart, Case No. 7)

4th As sinus infection is so frequently a cause of broncho pulmonary suppuration and is also a source of toxemia, these areas should be cleaned up while the patient is going through this period of watchful waiting

If, after a reasonable trial with the above measures satisfactory improvement has not been reached, then some other course must be determined upon

In the treatment of both conditions one must remember that remissions in symptoms and physical signs are not at all infrequent and that time is the great factor in determining the result (See Case No 2)

Many cases of lung abscess heal spontaneously after they have emptied into a bronchus and drained, but one must be on the watch for many months lest a recurrence of symptoms occur

A spontaneous cure of bronchiectasis rarely occurs excepting in those cases of short duration due to the presence of a foreign body Frequently one sees a rapid cure in these cases after the foreign body has been expelled or extracted

In some chronic bronchitis cases as well as bronchiectasis, the instillation of small doses, 5 to 10 CC, of iodized oil into the affected area offers considerable hope of benefit. The lipiodol remains in the smaller bronchi for some days and in one of our cases was apparently helpful in bringing about a satisfactory result. (See Case No. 1)

In cases having spirochaetes in the sputum, arsphenamin has been warmly advocated, but in our hands it has not proven beneficial

The measures, other than those defined above, to be considered are bronchoscopic drainage, compression of the lung by artificial pneumothorax or rib resecting operation, cautery drainage and finally lobectomy

Of these I shall discuss only compression of the lung by artificial pneumothorax We feel this

at 4 a m 6 ounces Refill given with plus 4 plus 12 pressure At 10 45 a m April 14th, fatal

hemorrhage occurred Autopsy denied

This case, with two diagnoses of carcinoma from different regions of the body, is most unusual. In the serial X-Ray study of this chest there was a very definite thickening in the lower hilum region of the right lung which gradually increased in density and in November, 1925, there appeared in the outer edge of an adhesion in the 2nd anterior interspace, a circular density 2½ cms in diameter, which remained about the same size until the end. The continued cough and repeated hemoptysis would make one suspicious of malignancy, but the duration of eight years is, to say the least, most unusual

The laboratory report of carcinoma in the prostatic urethra was most probably a mistake in the specimen for there was never any clinical evi-

dence to support the diagnosis

Case No 6—J C, Italian Shoemaker Age, 28 Married. Admitted to the Rochester General Hospital March 30, 1927, complaining of productive rough, loss of weight and weakness

Past History Irrelevant

Present Illness Eight days following mastordectomy under ether anesthesia on Feb 28, 1927, developed cough, more troublesome in early morning Has lost 15 pounds during past month No history of hemoptysis or night sweats one week before admission, cough became productive of foul smelling sputum which has increased until on admission was raising 150 C C daily Temperature and pulse elevated On physical examination, marked duliness with bronchial breathing, increased whisper and rales from the 4th to the 8th ribs, most marked inside the angle of the scapula, was heard X-Ray showed dense mottling of central portion of the right lung Blood count with multiple abscess cavities showed leucocytosis of 15,000 Urine normal Sputum negative for tubercle bacilli, many specimens On bed rest and postural drainage, condition improved rapidly and patient left hospital on April 13, 1927, against advice on discharge showed marked improvement in the Patient has been watched in the OPD and on July 7th his general condition was excellent, has gained weight, now weighing more than he ever did in his life Cough and sputum practically disappeared and there were no signs of disease heard in his chest

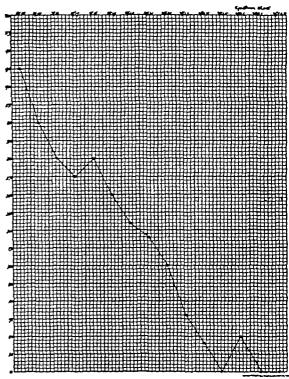

Case No 7—Mrs L S, Italian Housewife Age, 44 Admitted to the Rochester General Hospital April 12, 1927

Past History Had been under treatment for

ulcer of stomach for past two years

Present Illness Five weeks before admission began coughing and raising foul sputum, became short of breath and had high fever. The night before admission raised blood with very foul sputum. Upon admission appeared critically

ill, much prostrated, temperature 101, pulse very rapid, cough and sputum excessive 450 C C sputum in 24 hours Physical examination showed marked dullness with distant bronchial breathing and rales inside angle of right scapula X-Ray showed very large, mottled shadow in lower lobe of right lung, with several areas suggesting small cavity formation Patient was kept lying on left side and showed marked improvement and by the end of two weeks, temperature and pulse were normal, cough and sputum had entirely ceased and on April 30th she left the She was seen in the hospital against advice O P D on May 5th, at which time she said she had no cough nor sputum and felt perfectly well, but the right lower lobe was still very moist. This was the most spectacular drop in the sputum we (See illustration) X-Ray on have ever seen discharge from the hospital, showed marked clearing of the process

Case No 8—Mrs C M, age, 23, housewife Admitted to the Rochester General Hospital October 17, 1926

Family History and Past History unimportant Present Illness Following the wholesale extraction of 25 teeth, developed swelling in floor of mouth which proved to be Ludwig's Angina Incision and dramage on October 17, 1926, and discharged cured October 23, 1926 Shortly after returning home from hospital began with night sweats, loss of weight and strength and began cougling On December 23rd, raised about two ounces of blood mixed with foul pus On January

oped, in bed 3 weeks. Cough was very trouble-some and began raising whitish sputum at end of attack. In bed again during parts of Jan and Feb About March 1st had hemorrhage of six ounces. In March was seen by a physician and referred to me re collapse of right lung. Sputum was now very foul and large in amount. Signs of consolidation right lower axilla and X-Ray showed dense shadow in lower right lung. Sputum 150 C.C. W.B.C. 13,300, 82% polys.

Lipiodol April 3, 1926. In outer part of right

Lipiodol April 3, 1926 In outer part of right lower lung, at level of 6th rib in axilla, a triangular area with base at periphery, did not fill with lipiodol, but the lung both above and below filled perfectly. We therefore diagnosed the condition as a bronchiectasis, probably secondary to the foreign body which she expelled. Given one dose of Arsphenemine, violent reaction with dermatitis lasting about one week.

Pneumothorax started April 23, 1926 and on might of the 26th, after first refill, coughed and raised a sharp piece which she thought was bone, this was lost in the laboratory Sputum reduced from 150 CC very foul, to 5 CC no odor, after six injections of air Lung still collapsed, July 12, 1927, and has no cough, very little sputum since June, 1926

Case No 4—Mrs F J B, Age, 29 Housewife

Past History Irrelevant

Present Illness Six days following normal childbirth, on Nov 19, 1923, nipples became cracked and very tender and temperature became elevated and continued from 100-102 ing cough began at this time and became gradually more severe and heavy night sweats occurred On Dec 15th was diagnosed as postpartum flare up of an inactive pulmonary tuberculosis and seen in consultation on December 16th left lung above the 4th anterior rib showed slight dullness with broncho vesicular breathing and many fine rales following cough An X-Ray made at this time showed a dense, rounded shadow in the left upper lung field. The sputum was scanty in amount and was negative for tubercle bacilli, the white count 12,000 Urme normal On January 6, 1924, artificial pneumothorax was begun, before the abscess ruptured Temperature and pulse became normal, appetite returned and patient felt practically well after January The lung 28th, when the 7th refill was given now showed a satisfactory collapse and was kept collapsed until in June it was allowed to expand almost to the periphery, for X-Ray study, which still showed heavy linear markings in the abscess The lung was again collapsed and on August 15th the last refill was given On September 8, 1924, the lung was fully expanded and was apparently normal upon physical and X-Ray She has since continued in good health and in November, 1926, her second child was born, with no ill consequence

Case No 5—H C P, Lung abscess accompanying malignancy? Age, 56 Physician Seen March, 1919

Family History and Past History uneventful, always very strong and healthy In December, 1918, came home from Camp, was ill on trip with flu followed by pneumonia in lower right lung Very slow recovery with paroxysmal cough and prostration, sweats and irregular fever In March, 1919, was X-Rayed and diagnosed as probable lung abscess and referred to me At this time there was slight dullness with few large rales in the middle lobe, very severe paroxysmal cough with raising of glairy mucus X-Ray showed a mass located centrally in the middle lobe of the right lung Artificial pneumothorax was refused Condition continued about the same until in August, 1919, consulted Dr Howard Lilienthal who had him bronchoscoped and a section taken from the bronchus was diagnosed as adeno-car-Colis Vaccine was then advised and administered with quite severe reaction following each dose until October when the abscess ruptured, discharging about 1/2 pint very foul pus Vaccine was discontinued and pneumothorax was again refused The next year small hemorrhages 1-3 ozs occurred several times, but he was free of fever and the general condition was very good —the cough, however, remained troublesome and sputum varied from 100 to 150 C C daily, at times very foul In October, 1920, hemoptysis became so frequent and so copious that artificial pneumothorax was agreed upon Very good collapse obtained with marked improvement in cough and expectoration On January 27, 1924, in Tucson, Arizona, had acute appendix and gall bladder removed under local, by Dr Gore. Never regained back to previous condition, lost weight and strength, cough still troublesome, glary mucus In January, 1925, 3 ozs hemorrhage occurred but was controlled by plus 14 plus 18 intrapleural pressure in the pneumothorax. Beginning in November, 1925, had much trouble from frequent, painful micturation which culminated in a series of three operations for removal of the prostate by Dr D M Davis A specimen from the mucus membrane of the prostatic urethra was reported as carcinoma Cystitis persisted and in September, 1926, Dr Davis, through a suprapubic incision, removed several large and small vesicle stones, one from the prostatic urethra and no evidence of cancer was discovered Chronic cystitis persisted for several months, then gradually disappeared In May, 1926, while driving auto, had head-on collision, steering wheel striking epigastrium, no severe injury gust was much better and able to be around more Cough still troublesome but not so intense, was markedly dyspnoeic on exertion Bladder symptoms persisted, Dr Davis reported prostatic region and bladder apparently normal April 13, 1927, during the night raised about two ounces blood,

correct position of the tube, any rotation or movement of the head or lack of sufficiently penetrating roentgen ray will make interpretation difficult or impossible. Other special positions may sometimes be resorted to when it is desired to show the presence of fluid or opaque media in any particular sinus cavity.

Close cooperation between the clinicians and roentgenologist is requisite if accurate diagnosis is desired. May I remark here that I think it is without the province of the roentgenologist to give an opinion with regard to the condition of the structures in the nasal chamber itself, as those anatomical parts are readily visible to the rhinologist by direct observation.

The structures of the thorax are admirably adopted to roentgen examination, although we now know that before the introduction of the use of Lipiodol by Forestier in 1922, we overlooked many things, which, through the use of this medium, are now clearly visible

Lipiodol is a chemical combination of iodine and poppy seed oil containing forty per cent iodine, it is a clear, pale yellow oil, heavier than water, and non-irritating. There is a similar Merck product, Iodipin, but it is apparently not as readily available as the French compound. This oil can be safely introduced into the lungs in most chronic pulmonary affections, the most notable exception being a progressive pulmonary tuberculosis.

In our work there has been no untoward effect from the use of Lipiodol and we have used most of the various methods of introduction into the lungs Experience has shown the supra-glottic method of introduction to be the method of choice in adults and the bronchoscopic method the one of choice when cooperation is not obtained or when the patient is a child Whenever possible, Lipiodol should be introduced in a dimly lighted room with the patient sitting or reclining as close as possible to a fluoroscope, so that examination can be made at any moment, as oftimes the fluoroscopic examination is most important, the Lipiodol is shown clearly, one can judge as to the amount necessary to introduce and too often, the patient will cough before films can be made, thereby displacing the Lipiodol from the desired posi-Stereoscopic films should always be made, even though the patient coughs, as invaluable information is often obtained, with regard to the position and extent of the pulmonary disease in Lipiodol is eliminated spontaneously from the lung by coughing, although a small amount of it often remains in the lung structure many weeks or months Strangely enough, this substance remains longest in a normal lung, evidence of its non-irritating quality Affected portions of the pulmonary structure are emptied quite rapidly, especially in bronchiectasis

Roentgenologically, Lipiodol is one of the most recent and important additions to the armamen-

tarium of the roentgenologist, ranking in importance with the use of sodium tetraiodophenolphthalein in the examination of the biliary tract Previous to the use of Lipiodol we were able to see in good detail both lungs as far down as the level of the diaphragm. Now we realize that that portion of the lung field below the level of the highest segment of the diaphragm is the portion which is often extensively involved in bronchiectasis and which could not be shown were it not for this extremely important contrast medium

Bronchicciasis -It is often difficult and in some cases impossible to make a diagnosis of bronchiectasis from the ordinary stereoscopic pair of roentgenograms, yet diagnosis is positive after the introduction of Lipiodol In this affection the bronchi and smaller terminal branches of the lung structure show as tubular or sacculated dilatations, the normal appearance of the terminal branches resembling tiny bunches of grapes, is entirely lost and the dense masses of Lipiodol are seen in their place, running at times to the lowest extremity of the lung The study of this disease requires careful consideration with regard to the amount of Lipiodol which should be introduced into the pulmonary structure—too little of the substance will make the diagnosis difficult and too much confuses, especially in the normal lung when the smallest branches are massed and may appear pathologic

Lung abscesses —Single or multiple lung abscesses can be very well shown following the administration of Lipiodol only in case the abscess or abscesses communicate freely with the bronchus and thus admit the Lipiodol Stenosis of a main bronchus can be readily demonstrated by Lipiodol, but it should be kept in mind that the appearance of stenosis or atresia of a bronchus may be due to the fact that the bronchus is filled with thick pus and consequently cannot admit the contrast medium to its lowest extremity

In the fluoroscopic examination, views should be made from every possible angle amination should be made as rapidly as possible because the patient, on the slightest irritation, is liable to have a severe coughing attack, changing the position of the Lipiodol and rendering further examination unsatisfactory In making the stereoscopic films of the chest the ordinary position is satisfactory, the patient stands in the erect position with the roentgen tube at the back and pointing slightly downward toward the feet, the central ray being about at the level of the fifth dorsal verebra In the case of multiple lung abscesses or even of single lung abscess it is often of the very greatest advantage to make two flat films one in the postero-anterior direction and the second in the antero-posterior direction when these two films can be carefully compared, very definite information may be obtained with regard to the location of the abscess or abscesses by means of the comparative size and sharpness of

9, 1927, a second hemorrhage of about 3 ounces occurred and she was readmitted to the hospital

Physical Examination showed marked duliness at base of left lung with broncho vesicular breath sounds below the 3rd anterior rib and 5th v s. The bronchial character of the breath sounds was more marked inside the scapula. Postural drainage and rest instituted. X-Ray showed small, multiple abscess cavities in lower lobe at the level of the 6th and 7th ribs, just outside mediastinal shadow. Improvement was rapid and on February 10th cough was much reduced and she had gained 5 pounds.

The signs in the apex of the left lower lobe gradually cleared and she was discharged to the O P D on April 16, 1927 On June 1st she

raised about an ounce of blood. She has continued to rest and use postural drainage and cough and sputum are practically gone, now raising only once or twice in the morning. X-Ray made July 7, 1927, shows cavities still present, but probably smaller. She will be kept under close observation and she may yet have to come to some surgical procedure to complete the cure.

The cases reported above constitute some of our successes obtained under so-called medical care. The failures constitute quite a large percent and if, after a reasonable length of time, they do not make satisfactory progress, they are then treated by bronchoscopic drainage or some surgical procedure to be described elsewhere in the

symposium

BRONCHO-PULMONARY SUPPURATION FROM THE ROENTGENOLOGIC STAND-POINT*

By E FORREST MERRILL, M D, ROCHESTER GENERAL HOSPITAL, ROCHESTER, N Y

IN the discussion of broncho-pulmonary suppuration, the relation of infection of the nasal accessory sinuses to the broncho-pulmonary involvement must be considered and for this reason it will be well to review briefly the roentgenologic aspects of the normal and pathologic states of the pneumatic structures connected with the nasal chamber Roentgenologically, these structures are not easily accessible on account of the dense bony structure of the skull and for this reason many different methods of examination have been devised These various methods all have their particular advantages, but after all the method for any roentgenologist to use is the method which has proven to be the most satisfactory in the hands of that roentgenologist and his associates In our work we have adopted as a routine method of examination of the accessory sinuses, that method which was described by Van Zwaluwenburg in 1921 and which was used for many years in the clinics of the University of Michigan Hospital

The technique for the examination of these pneumatic structures is as follows the patient lies in the prone position with the arms folded comfortably under the chest and the head resting with the forehead and nose on the film tunnel which is inclined at an angle of twenty-three degrees from the horizontal. A Coolidge roentgen tube of the radiator type is used and a cone ten inches in length and three inches in diameter is adjusted below the tube. For the first exposure of the stereoscopic pair the central ray is directed in a straight line through the external auditory meatus and external canthus of the eye, the end of the cone being as close as practicable to the

The technical details of this examination must be strictly adhered to, for any deviation from the

skull and centered carefully in the sagittal plane of the body, this should make the target-film distance approximately twenty-four inches, the second exposure is made after the tube is moved cephalad two and one-quarter inches and tilted back to cover the same area included in the first The resulting roentgenograms will exposure give a satisfactory stereoscopic view of the nasal accessory sinuses, the dense occiput does not interfere, the odontoid process of the second cervical vertebra is thrown out of the field and the shadow of the petrous portion of the temporal bone, the most dense interfering structure is seen to be in the lower portion of the shadow of the orbit, where it does not interfere materially with the visualization of the air-containing structures

The interpretation of findings in films of the accessory sinuses is probably one of our most difficult problems, but there are certain characteristics which experience has taught us to be indicative of disease Chronic sinusitis with thickening of the membranous walls, polyoid disease, chronic sphenoid sinusitis, acute sinusitis with empyema and associated conditions exhibit certain charac-The frontals, anterior and posterior teristics ethmoids, sphenoids and maxillaries can be differentiated in a good stereoscopic pair of films and much can be told concerning their condition Some characteristics which are pathognomonic of sinus disease are fuzziness of the sinus walls, lack of differentiation in the ethmoid region where cell structure is usually quite distinct, increase in density in the shadow representing the sinus cavity, increased density in the walls of the sinuses, evidence of fluid and sometimes even perforation of the bony wall of the sinus

*Read before the Lake Keuka Medical and Surgical Association, Lake Keuka, N Y, July 14, 1927

the bronchial lumen by stricture, compression or new growth. In children the bronchoscopic method in proper hands is unquestionably simpler and more satisfactory than intratracheal methods. The usefulness of the bronchoscope in the accurate diagnosis of pulmonary suppurations therefore seems beyond question

BRONCHOSCOPY AS AN AID TO TREATMENT

Lung Abscess—In discussing any phase in the treatment of lung abscess, it is important to emphasize from the onset our appreciation of the fact that cases vary widely in their therapeutic Some (as for example those folpossibilities lowing bronchopneumonia) will inevitably carry a high mortality, whereas others (as a certain number of post tonsillectomy abscesses) will clear up spontaneously The etiology, position and duration of the abscess, the virulence of the infection as well as the general resistance of the patient are all variable yet important factors in We heartily agree that the basic prognosis treatment in acute lung abscess in general is absolute bed rest combined with postural drain-In cases communicating with a bronchus, however, early bronchoscopic treatments, carried out at weekly intervals and consisting primarily in thorough removal of secretions by suction form a valuable adjunct to these measures stagnation of secretions deep in the lungs which so frequently persists in spite of conscientious Postural drainage is thereby effectively prevented A striking feature of the bronchoscopic treatment is the rapidity with which the amount and odor of the secretions decrease and the general condition of the patient improves Bronchoscopy, however, should not be employed in abscesses not communicating with a bronchus nor in the peripheral type of abscess where rupture into the pleural cavity seems likely In cases of abscess secondary to a foreign body bronchoscopy of course is the only method worthy of con-Even in cases of foreign bodies of many years sojourn, removal of the invader usually results in rapid cure without subsequent treatments In this respect such abscesses differ markedly from abscesses of other causes, which although grossly similar often resist months of treatment This fact illustrates in a striking way the diwculty of pyagenic invasion by the endobronchial route Finally, in cases of chronic abscess bronchoscopy, by improving drainage will often cause surprising amelioration of symptoms and in this way add to the comfort of the patient or prepare the way for successful surgical intervention

Bronchiectasis—From the clinical point of view, we may divide bronchiectasis into three groups First, early cases, usually occurring in childhood involving the smaller bronchi and bronchioles, and characterized by mild or intermittent symptoms. Second, well established forms, mostly in older children or adults with definitely dilated

and thickened tubes and with continuous and severe symptoms. Finally, those cases where brochiectasis is an accompaniment of abscess formation, the result in many cases of aspiration of a foreign body. The indications for bronchoscopy in this group of cases demand no comment

We have been particularly interested in those early cases with mild symptoms because we feel that it is in this group that bronchoscopy will prove of great usefulness As McCrae says so aptly, "Bronchoscopy is of great value in the treatment of bronchiectasis if used early, but We may be able to early should be stressed prevent advanced bronchiectasis by early recognition and prompt bronchoscopic treatment" have seen a group of children, clinically suspected of having bronchiectasis, but whose pneumonograms showed essentially normal or slightly altered bronchial trees In these patients the prevention of stagnation of secretions by postural and bronchoscopic drainage seems the best prophylaxis against possible progression into well established bronchiectasis

We have treated a rather large series of older children and adults whose pneumonograms showed well marked bronchiectasis. It has been gratifying to note the often striking improvement in certain of these patients after a regime of postural and bronchoscopic drainage had been instituted. Not only have the amount and odor of the secretions diminished but definite improvement in the general condition resulted. Such a course often offers the only hope of amelioration in these patients. Cure, however, is rare except in those cases which are secondary to a foreign body,

successfully removed

The frequency with which a chronic sinusitis accompanies bronchiectasis has been striking in our own as in other series. No improvement in the lung condition can be expected from any form of treatment until such infection has been thoroughly eradicated. This is obvious when we recall the tendency of postnasal drainage to enter the trachea especially during sleep, as well as the indirect lymphatic drainage from the sinuses to the lungs which Mullin (3) and others have demonstrated. The cooperation of the rhinologist, thereore, is essential in the management of these cases.

In conclusion, then, bronchoscopy constitutes not only an important aid in the diagnosis of lung suppurations but in selected cases a most valuable adjunct to other fundamental methods of treatment

LANTERN SLIDES

1 Normal bronchial tree outlined by lipiodol injected through the bronchoscope, A man of 35 with a chronic basilar infection suspected of being bronchiectasis

outline of the cavities The last feature is often of value in the case of cavities which are partially filled with fluid, even though no Lipiodol has been introduced Another special position in examination of the lower left lung follows the patient faces forward with the film at his back, the tube twenty-four inches to the left of the mid-line of the patient and the central ray directed toward the fifth interspace in the nipple line, in a horizontal direction This technique is responsible for a quite satisfactory visualization of the lower left lung field The advantage of this position hes particularly in the examination of the lower left lung which is obliterated by the cardiac shadow

Conclusions

(1) In all cases of chronic broncho-pulmonary suppuration careful roentgenographic and roentgenoscopic examinations will add much to the clinical investigations. The accessory sinuses should always be included in the roentgenographic examination, especially in the investigation of basal lesions.

(2) Lipiodol is of the greatest advantage in the demonstration of bronchiectatic cavities and abscess cavities both above and below the level of the upper portion of the diaphragm

(3) Special position should be resorted to in the accurate localization of lung abscesses and in the roentgenographic study of the base of the left lung

BRONCHO-PULMONARY SUPPURATION FROM THE BRONCHOSCOPIC POINT OF VIEW*

By CLYDE A. HEATLY, M D, ROCHESTER, N. Y

HE growing recognition that the management of pulmonary suppurations necessitates the close cooperation of internist, surgeon, roentgenologist and bronchoscopist marks a long step forward. The variety of etiological factors and pathological conditions involved make it at once apparent that it would be utterly unjustifiable for anyone of this group to undertake alone the diagnosis and treatment of these cases.

Bronchoscopy to be useful must first of all be This is not a field for the occasional bronchoscopist Our experience, during the past year, during which nearly three hundred diagnostic and treatment bronchoscopies have been done. many of them in young children, without fatality, confirms the opinion that in proper hands this procedure can be done without risk to the patient † Proper selection of cases is of course important / Bronchoscopy is contraindicated in the presence of fulminating suppurative pneumonitis, in cases where the abscess has extended to the periphery with imminent danger of rupture into the pleural cavity and in moribund cases where it could be of no conceivable value It is inadvisable after recent pulmonary hemori hage and must be undertaken with great caution in the presence of marked cardiovascular disease All examination should be conducted without anesthesia except in adults where local anesthesia to the pharynx, larynx and trachea is necessary have found the Jackson instruments and methods more satisfactory than the proximally lighted instruments in this work

Bronchoscopy as an Aid to Diagnosis

While other simpler methods of introducing lipiodol have of necessity come into popular use, they cannot compare with the accuracy of introduction possible through the bronchoscope and will often prove inadequate in cases where the bronchi are obstructed by thick pus, granulations or actual narrowing of

tWe have had but one severe reaction—the development of marked dysphoea in a boy of five with a postdiphtheritic partially stenotic larynx necessitating reopening of an old tracheotomy wound for 72 hours Foreign body cases present more serious problems and cannot properly be included in this group

^{*}Read before the Keuka Lake Medical and Surgical Association, Lake Keuka, N Y, July 15, 1927

I believe, should be observed as rules and not broken except for some very good reason Localization Physical signs, the X-ray, lipiodol injections and bronchoscopic study must be used to determine the exact location and nature of the lesion and the condition of the remainder of the (2) Exploratory puncture with a needle, in search of intra-pulmonary suppuration, is dan-Fatal infection of the pleural cavity or (3) Multiple chest wall may follow aspiration stage operations have done much to reduce operative mortality I believe that the one-stage drainage operation, in lung abscess, is not safe (4) Use of local anesthesia whenever possible Frequently, multiple rib-resections can be performed upon children under local We have operated upon the chests of a fairly large series of children under local alone (5) Operation with the head low, as pointed out by Lilienthal, may prevent cerebral air emoblism (6) Cavities should be carefully emptied by postural drainage before the patient is sent to the operating room (7) Transtusions should be freely used in the chronic cases with impoverished blood pictures

Lung Abscess — The surgical principle involved in the treatment of parenchymatous lung abscess is drainage There is very little place for use of compression other than artificial pneumothorax Fortunately, the abscesses that are less likely to recover spontaneously are located at the periphery of the lung where they are more accessible to surgical approach Lockwood says that 75% are peripheral A lung abscess may rupture into the pleural cavity Occasionally, it will rupture into an unwalled off pleura, producing an acute pyopneumothorax which is almost invariably fatal The abscess, however, is much more likely to rupture into a plenral cavity protected by adhesions, with a resultant empyema In our experience, simple drainage of the empyema has resulted in the curing of these cases This does not occur, however, with empyema complicating bronchiectasis and more radical surgery, directed toward the intra-pulmonary focus, is necessary to cure the patient

drainage operation A window is made down to the parietal pleura by resection of one or more ribs—usually two Packing gauze against the pleura for a period of five to seven days will insure adhesions between the layers of pleura Attempts at approximating visceral and parietal pleura by suture are likely to result in the needle passing into infected tissue, under the visceral pleura, with contamination of the pleural cavity, especially from the contents of a lung abscess, is a frightful infection. I have had two such experiences, in one of which the infection was mainly anaerobic. Both cases died very quickly.

adhesions have formed, the abscess may be

located by aspiration with a needle and the cavity

opened by knife, blunt instrument or cautery It

The simplest form of treatment is a two-stage

is advisable to make a wide opening through the overlying lung tissue, so that drainage will not be through a narrow tract The tract should be kept open until the lung cavity has obliterated Drainage is usually prolonged for several weeks For simple, uncomplicated parenchymatous lung abscess, I see no reason for more extensive surgery than I have described The marsupialization operation, described by Lockwood, seems to me unnecessary and is bound to carry a greater The utilization of a long skin-muscle pedicled flap, reported by Butler, although having a very useful place in thoracic surgery, should be reserved for cases requiring more extensive surgery over a longer period of time than is necessary for the cure of a simple lung abscess

Suppurative Bronchiectasis—The types of this disease which are considered surgical are the long standing, extensive lesions which can be offered only slight palliation by medical treatment fore we consider a case for extensive surgery, it must go through the various treatments outlined Lloyd and Heatly If there is enough improvement to satisfy us, we must balance the misery of the patient, his inability to be other than a nuisance to himself and others, because of the severe cough and foul sputum, and the dangers of spreading infection, hemorrhage and metastatic infection, against the dangers of operation and the probabilities of cure or marked 1mprovement Three surgical principles are in use in the atack on this problem (1) Drainage (2) Compression (3) Extirpation

Dramage —Dramage will not cure bronchiectasis, but it will relieve the patient of much of his cough and expectoration With good aeration, the nature of the drainage changes and the pus rapidly loses its foul odor and becomes more A permanent fistula, conecting the bronchus or bronchi to the surface, remains, this necessitates the wearing of dressings tient must not submerge himself in water so that the fistula is under water, because of inhalation of water into the bronchial tree through the com-There is danger of hemorrhage, munication which may be severe, and of cerebral metastasis There is very little with abscess or meningitis to recommend this type of surgery, but there are cases so reduced physically that any surgery, more

Graham says he has never seen a patient made well by simple drainage Cases have been reported where the fistula eventually healed spontaneously and the patients remained well. However, these were reported before the use of lipiodol and it is quite probable that a parenchymatous abscess, instead of bronchiectasis, existed

radical than drainage, will be too severe To this

class of patient, simple drainage offers some

Artificial Pneumothorax —This surgical procedure has become a part of the medical treatment and Lloyd has taken up this valuable method of therapy

2 Abscess in the right lower lobe (lateral view, outlined by lipiodol injection through the bronchoscope after removal of obstructing granulations and thick pus which filled the cavity in spite of postural drainage immediately preceding bronchoscopy. In the AP view the abscess is partially obscured by the heart shadow. Such a picture could not be obtained by simple intratracheal injections.

3 Stricture of the left main bronchus outlined by lipiodol injection through the bronchoscope Successful introduction of lipiodol into the left lung after dilatation of the strictured

bronchus No evidence of foreign body

- 4 Carcinoma of the right main bronchus in a man of 55 discovered by bronchoscopic examination. History of productive cough, recurring small hemoptyses and vague substernal distress following an attack of "grippe" 6 months before Clinical and X-ray studies show increased retromanubrial dullness to the right. Pathological report on specimen excised confirmed the diagnosis of carinoma.
- 5 Well marked cylindrical bronchiectasis of the left lower lobe Woman of 41 with history of cough and purulent expectoration for past 21 years History of small hemoptyses on two or three occasions Clinical and plain X-ray studies essentially negative
- 6 Child of 3 with paralysis of the intercostals and both legs following birth injury Bronchiectasis suspected Bronchoscopic studies including pneumonogram show essentially normal bronchial trees
- 7 Italian girl of 8 with cough and mucopurulent expectoration, suspected of having bronchtectasis Pneumonograms shows essentially un-

changed bronchial tree Evidently a case of purulent bronchitis

8 Acute lung abscess in a boy of 7 coming on 11 days after tonsillectomy. Complete recovery after 3 bronchoscopic treatments at 6 day interval. No evidence of recurrence after 8 months observation and all signs have disappeared. No cavity demonstrable in pneumonogram although plain plate shows increased density in the right hilum region.

9 Pneumonogram showing well marked bilateral bronchiectasis in a girl of 14 with history of cough with foul expectoration since age of 3, following pneumonia. Bilateral maxillary sinusitis. Treatment of sinusitis combined with postural and bronchoscopic drainage has resulted in striking improvement in general condition. Very little cough remains and expectoration has been reduced from 250 cc to less than 40cc daily

an Italian girl of 16 Symptoms date from pneumonia at age of 1 1-2 years Bilateral maxillary sinusitis Treatment of the sinus infection followed by a regime of postural drainage and weekly bronchocopic treatments has reduced the expectoration from over 200 cc to less than 50 cc daily and has produced great improvement in the general condition

11 Well marked bilateral saccular bronchiectasis in a boy of 11 Symptoms since 10 months of age Bilateral maxillary sinusitis Treatment has been carried on at weekly intervals since last September but expectoration, while decreased, is still profuse Improvement in this patient has

not been as striking as in the others

12 & 13 Pneumonograms of other children with well marked bronchiectasis now under treatment

BRONCHO-PULMONARY SUPPURATION FROM THE SURGICAL STANDPOINT* E W PHILLIPS, MD, ROCHESTER, N Y

NFORTUNATELY, all cases of bronchopulmonary suppuration do not get well under medical management It is probable that somewhere in the neighborhood of 50 per cent will eventually require external drainage or other type of operation The great part of the mortality in lung suppuration comes in the group needing surgery In a series of 105 operative lung suppurations reported by Lilienthal, there was a mortality of 45 per cent. This does not include lobectomies I think that Miller and Lambert, with their team-work, have done much to reduce the mortality in lung abscess, in delaying operation in the acute stages, very much as the work of Graham and others lowered the mortality in acute empyema by show-

*Read before the Keuka Lake Medical and Surgical Association, Lake Keuka, N Y July 15, 1927 ing that operation should not be performed during the formative period of an empyema

Before we are in a position to outline a surgical attack on a case of broncho-pulmonary suppuration, a very careful study of the nature of the pathology and its location is absolutely essential. As a surgical problem, broncho-pulmonary suppuration must be divided into the lung abscess or parenchymatous group and the suppurative bronchiectasis group. We realize that it is improbable that disease of long standing, beginning as either group, remains entirely a parenchymatous lesion or a bronchiectasis, but one element so predominates that our surgical attack is directed toward it

Before taking up these groups separately, I want to speak, briefly, of a few general principles in the surgery of pulmonary suppuration which,

coughed up large pieces of clotted blood. Since that time has had a chronic cough and sputum, sometimes a cupful in amount. Raises 4 to 10 oz in 24 hrs lying on right side or back, coughs and raises more. Has had frequent night sweats recently. Has always been thin but thinks he has lost weight recently. Frequent attacks of prin in left chest Heart palpitates and is short of breath on exertion. Frequent frontal headaches Eight specimens of sputum negative for TBC.
11-25-25—Discharged from R G H
2-25-26—Readmited 3-2-26 raising 12 oz sputum

during 24 hrs -very foul

Physical Examination -Left upper lobe breath sounds very feeble, flat Rales heard throughout entire left chest, especially numerous at the angle of the scapula, posteriorly, where the sounds were amphoric On account of duration of disease, artificial pneumothorax not considered advisable

3-10-26—Phrenectomy 3-15-26—Stereo chest 3-15-26—Stereo chest right lung clear, left showed modement in the upper third, lower two-thirds showed obliteration of the normal lung structure by dense and irregular mottling which was quite characteristic of bronchiectasis Heart and mediastinum displaced to the

4-13-26-After lipiodol through the cricothyroid membrane, the bronchi are well outlined on the right, apparently normal. Not enough lipiodol in the left-expelled through cough before plates could be made.

3-20-26—First stage thoracoplasty Second stage 4-4-26 First rib 4-28-26 After third stage, raised 12 oz daily Thoracoplasty did not diminish sputum very

materially and he was allowed to go home.

10-7-26—Re-entered hospital 12-9-26 anteriorthoracoplasty done, 2nd, 3rd and 4th ribs resected on left under local anesthesia Was unconscious and cyanotic when leaving table but, on stimulation and oxygen, condition improved temporarily Respiration became more shallow and he died 3 hrs after operation. Had a high leukocytosis all along-30,000

Death probably due to cerebral embolism

Externation of the Diseased Lung

Lobectomy

Cautery pneumectomy

Lobectomy —Were it not for the mortality attached to such operative procedure, this would be the ideal surgical treatment. It is to be hoped that, with the progress that is being made in thoracic surgery, within a few years we will have developed a method of extirpation that will not have a prohibitive mortality. It has long been the aim of surgeons to remove diseased lung tissue It was successfully done, experimentally, in 1884 by several workers In the early work on the Surgery of Tuberculosis, extirpation was thought to be the ideal and successful resections were reported by Stretton, Tuffier, Doyen, Lawson, Sonnenberg and McEwen In bronchiectasis, lobectomy has been studied by a host of observers Heidenhain, Halferich, Murphy, Friederich, Sauerbruch, Muller, Kummel, Meyer, Robinson, Lilienthal and others The largest series has been reported by Howard Lilienthal, with a mortality of 47% for single lobe removal and about 70% mortality when more than one lobe has been Only 24% of the whole are cured The operation is a tremendously severe one and is attended by severe complications. The description of the operation and post-operative period

There is too much leaves much to be desired operative shock The inevitable pleural infection and the dangers of hemorrhage and tension pneumothorax which go with an operation that leaves the infected bronchial stump deep in the pleural cavity, demand that some less dangerous method Garre and Archibald have suggested be devised a preliminary thoracoplasty of the lower chest to an extent that will permit delivery of the bronchial stump outside the pleural cavity

The brief report of the following case of left lower lobe bronchiectasis represents my entire experience in lobectomy, except with the cautery method, and although it ended in a fatality. I believe it is a step in the direction of a safer lobec-

6-22-26—Liliodol injection. X-ray stereoscopic films of the chest, after injection of lipiodol, show a quite normal broncho-vascular structure on the right side. On the left, the broncho-vascular structure is distinctly not normal but the normal structure is replaced by numerous irregular areas which, apparently, represent cavity formation.

Started postural dramage 6-26-26—Phrenectomy, left Local 51/2" of nerve avulsed with practically no pain

Sometimes we are asked to supplement a pneumothorax by an intra-pleural pneumolysis. It is probable that there are cases where satisfactory compression is prevented by adhesions or bands that are readily relieved by endoscopic approach or open thoracotomy. However, I fear that, when adhesions do prevent a good pneumothorax, they will be so extensive, in the majority of cases, as to rule out this form of treatment. The X-ray may be very unreliable as to the number, size and position of adhesions between the lung and the chest wall. The following case illustrates this point.

Female, Age 21 Admitted 10-10-26

Past History—Married One child 4 yrs ago, following extraction of tooth, had pneumonia and has had troublesome cough—productive. General health very good 4 mos ago became worse and sputum became foul and increased in amount. Paroxysms resembling whoming cough have persisted in to present

whooping cough have persisted up to present Physical Examination—Height 61½" Weight 111½ lbs—loss of 11 lbs past year Temperature slightly elevated—99 plus Pulse 70-80 Sputum on admission 200 cc, very foul, negative for TBC, many mixed micro organisms found No reduction in sputum with postural drainage. Heart apparently normal B P 105-65 Feeble breath sounds confined to left lower lobe, with numerous moist rales persisting after cough

X-ray Dense shadows, lower left, after lipiodol, shown to be saccular bronchiectasis in lower lobe

11-15-26—Pneumothorax begun and being continued Lower lobe was adherent to diaphragm over inner two-thirds and laterally to chest wall, at level of 6th to 3rd ribs, preventing complete collapse of lower lobe. Thoracotomy done under local 1-22-27, resecting 7th and cutting 8th rib in anterior axilla. Adhesions freed as much as possible and chest closed and refilled with air with positive pressure. Small amount of bloody fluid aspirated several times, each time replaced with air. Sputum did not reduce and thoracoplasty preceded by phrenectomy was urged. Patient refused, is now pregnant and artificial pneumothorax will be continued until we can persuade her to have further operation.

In our zeal to collapse the lower lobe, we gave a positive pressure refill immediately after adhesions had been cut in the chest. Fortunately, no air embolism occurred

and we will not again make this mistake

Phrenectomy — The lung compression resulting from paralysis of the diaphragm has led several to use this simple procedure in hopes of obtaining cavity obliteration There is no doubt but that it will cause obliteration of some cavities, but it is probable that the stiff-walled cavities, associated with bronchiectasis, will yield very little to so mild a compression I believe it is worth trying bronchiectasis, we have seen very little dimunition in the amount of sputum and that only tem-However, we have not allowed any great interval of time to elapse after phrenectomy before adding further compression believe it is a good supplement to thoracoplasty and also to artificial pneumothorax, especially when the lower lobe is involved and partially adherent to the diaphragm

Thoracoplasty—Compression of the diseased lung by extra-pleural thoracoplasty has its ardent advocates and has also been quite as ardently criticized as being an unwise operation. Most of

the criticism arose at a time when an incomplete operation was being performed. It is now generally admitted that a much more extensive thoracoplasty than a posterior resection, such as is generally used in pulmonary tuberculosis, is This must be supplemented by an anterior resection or, better still, a complete decostalization in several stages, leaving only the anterior portion of the first and the twelfth rib The operation should be carefully graded so as not to be more than the patient can stand. At least three stages are needed, at eight to ten day It is better to use five stages than to intervals crowd the sick patient too much. The sequence of stages, as described by Harrington, seems logical to me Begin with the upper posterior from first to seventh inclusive Second stage, eighth to eleventh entirely Third stage, the anterior ends of second to seventh inclusive It is desirable to add a phrenectomy to this operation acoplasty, if not successful, may be followed by lobectomy or cautery pneumectomy Harrington advises no surgery after thoracoplasty for nine to twelve months, because the maximum improvement after decostalization does not come for several months

The selection of cases for thoracoplastic operations must be rigid. The disease must be unlateral and preferably one lobe. It must be bronchiectasis without parenchymatous involvement. It will do no good in patients who have had a good pneumothorax without relief. It would be ideal where an artificial pneumothorax had produced complete absence of sputum. I would not advise it in this case, however, unless for some imperative reason, artificial pneumothorax could not be kept up.

Compression, such as I have described, rarely results in a complete cure Hedblom, to whom we owe a great deal for keeping at this method of treatment in the face of criticism, can only show three cases, that are completely free from symptoms, out of a group of fourteen followed for three years One case died of pulmonary hemorrhage and the remainder have some sputum, varying from 30 to 90 cc Harrington reports thirteen cases—three have expectoration, varying from 15 to 30 cc, two from 30 to 90 cc, three from 60 to 120 cc and two from 180 to 240 cc All of these cases are very markedly improved and carrying on normal lives-this as a result of surgery that carries a very low operative mortality

The following case is shown to demonstrate how inadequate a compression by posterior thoracoplasty and phrenectomy is, in a long-standing bronchiectasis

Male. Age 30 Jewish Admitted 11-16-25

Past History—Cough, with a good deal of mucopurulent sputum since childhood No history of childhood diseases Operated in Russia for hernia 16 yrs ago Cough dates back to early childhood No illness preceding development of cough. Mother told him he in the chest, carries an almost prohibitive mortality. The removal of the diseased lobe by cautery, as suggested by Graham, carries a considerable mortality and requires prolonged surgical observation. The combined thoracoplasty - lobectomy, reported by Archibald, seemed the most logical procedure that has been suggested. I thought that a two stage lobectomy would allow adhesions to form so that, upon removing the lobe, several days after it had been delivered from the chest, one might have very little infection with which to deal

Phrenectomy preceded the thoracoplasty because I felt that less rib-resection would be required to cause obliteration of the space that remained after delivering

the lobe from the chest

This case was selected for this type of surgery because it was limited to one lobe and because we felt that no measures, other than eradication of the diseased tissue, would cause a cure. We were correct in our localization and I believe also in our second supposition.

Although the patient was never strong, progress seemed satisfactory until the first stage of the lobectomy was performed. The immediate shock was frightful—it seemed, for several hours, that she would not rally. This shock, apparently, was beyond what would be expected from the trauma or hemorrhage, of which there was considerable from the many adhesions. Reading Morrison's recent article in the British Journal of Surgery, wherein he tells how, in experimental animals, blocking of the vagus, prior to complete pneumectomy, changed the mortality from 100% to zero, makes one wonder if a considerable part of this shock may not be vagus trauma. It surely would be a simple procedure to block the branches of the vagus, where they cross the lobe pedicle, with novocain or alcohol and I believe it might be well worth trying

The main object of this operation was defeated during this stage when, in cutting through an adhesion, between the lobes, I entered limg tissue and again in suturing the pleura and intercostal muscles around the pedicle, the needle probably entered infected areas. In all probability, this was the origin of the pleural and wound infections

A suggestion from my surgical chief, H L. Prince, seems logical and probably will permit this operation to be carried out without this danger. He suggests that no sutures be used about the lung pedicle, the wound in the chest wall to be carefully sutured on both sides of the extruding lung and then very carefully pack gauze all about the lung pedicle—this gauze to remain in place until after the lobe has been removed by the cautery

Some form of "closed drainage" of the pleural cavity is essential, if other cases are going to have as much exudation into the pleura as there was in this case.

Death occurred rather suddenly in this patient at a time when we had almost given up expecting it. When seen, during morning rounds on the day of her death the patient looked better than she had for days. Her pulse was slower and of better quality. I do not know the cause of death but presume it was a myocardial exhaustion.

Cautery pneumectomy This offers a safer method of removing the diseased lung than lobectomy Graham reports forty-five cases so treated with a mortality of 25%, and 75% of the surviving showing improvement. It is not ideal, the mortality is too high in proportion to the percentage of cures. It is not as precise as lobectomy, as one must do considerable guessing in the amount of lung tissue to be cauterized.

The operation is performed in several stages. The preparation of the window through the chest wall requires considerable thought. It should be placed so that access to the diseased lobe is easy and of such an extent that too rapid closure will

not interfere with subsequent stages Usually the resection of four to five inches of three or four ribs is sufficient. After subperiosteal resection of the ribs, the intercostal bundles, nerves and vessels are carefully dissected away from the parietal pleura and excised. This makes it possible to accomplish the next stages without anesthesia and with little danger of hemorrhage from the intercostal vessels. The operation described by Butler—a large skin-muscle pedicled flap with incision on three sides of a rectangle and the skin edges sutured back out of the wayseems to me an admirabe approach for cautery pneumectomy When the window has been prepared, gauze is packed against the parietal pleura and we wait an interval of five to seven days before proceeding with the cauterization can be performed with the hot soldering iron, electric cautery or as done by Archibald with the diathermy needle We have used the electric cautery and proceed slowly, burning in stages into the diseased lobe. Apparently the fear of severe hemorrhage has not been a real menace. Graham had one case die as a result of hem-We have seen no severe hemorrhage The blood pressure in the pulmonary circulation is so low that packing easily controls bleeding

The following case is an example of extensive cavitation treated by cautery destruction

Male. Age 5

Past History—T&A. operation 1925 In February 1926 pneumonia, lasting 2-3 wks. Cough has persisted and been productive at times. Numerous febrile attacks have occurred. Appetite very poor and has lost about 10 the consequence of the production of the consequence of the consequenc

10 lbs since illness began.

Present History—About 2 mos ago sputum became fetid and increased in amount. 2 wks ago, after rather violent exercise, raised a mouthful of bright blood. There was present marked dullness over entire right chest with distant breath sounds below and bronchial breathing over upper third, most intense at level of 3rd anterior rib around chest. The left lung appeared clear Heart normal. Xray at this time, November 1st, 1926, showed a dense shadow over entire right side with several more radiable areas above the 3rd rib, suggesting capits, formation.

cavity formation
11-5-26—Admitted to R. G. H. Temperature 100-102.
Bronchoscopy performed by Heatly and lipiodol injection into right main bronchus—no evidence of foreign body found. Lipiodol study showed numerous cavitations in upper chest. A tentative diagnosis of bronchiectatic abscess was made, with probably a pleural effusion, and it was decided to try to aspirate and replace with air. No fluid was encountered but a free pleural reading was obtained and 200 cc. washed air allowed to flow in, on December 2nd, 1926. Xrav showed a small pocket of air between the diaphragm and the lower border of lung. A second refill of 150 cc., made the next day, resulted in further descention of diaphragm and no compression of lung.

12-10-26—Local anesthesia. Resected 6th, 7th and 8th ribs, posteriorly, but did not open into pleura. In four successive operations, between December 16th and January 26th, cautery drainage was successfully obtained. The box made steady improvement and was discharged from the hospital.

A rather stupid mistake was made in not aspirating the air from the pneumothorax pocket before any operative procedure, with the result that an unnecessary empyema was added to the list of drainage operations

Xray 6-26-26, after phrenectomy, shows left diaphragm at level of 8th interspace. Under the fluoroscope, the

only motion in left diaphragm is slight paradoxical 7-12-26—Operation. Partial posterior thoracoplasty Local anesthesia Time 1 hr Resection of a total of 381/4" of ribs, 5th to 11th inc. Wound closed with one drainage tube.

7-26-26—The patient continues to run a temperature of 100-101 and is coughing up more sputum Postural drainage upon a table carried out but the most of the daily sputum is coughed up and not obtained at time Wound in good condition except at lower of dramage.

end, where there is a mild skin infection. 8-6-26-Operation Gas and local Lobectomy Incision Long intercostal, opening left chest widely section of about 3" of two ribs at anterior end of inci-Left lower lobe bluish color and Findings apparently not air containing Upper lobe pink and crepitant Many firm adhesions between left lower lobe and upper lobe, diaphragm, chest wall and pericardium Diaphragm Lax and motionless What was done Left lower lobe freed from surrounding structures by scissor The lobe was then brought out of the chest wound and because of the previous thoracoplasty, the pedicle of the lung without tension was on level of chest incision Wound sutured about the lung pedicle. Before closing the wound a "closed drainage" tube was

inserted through the chest wall at lowermost part (Note—On two occasions, during the operation, air bubbling wounds were caused, first, in cutting adhesions with scissors, from upper to lower lobe, and, secondly, when suturing the lung pedicle and pleura together all probability, this accounted for the wound infection that followed)

Immediate post-operative condition was very poor and it seemed certain that patient would not rally soon as the gas-oxygen was discontinued, the pulse became rapidly weaker until it was almost imperceptible. The patient was left upon the operating table until late afternoon, during which time she received 500 cc. salme intravenously and 1000 cc. under the breast Pulse

gradually became stronger 8-7-26—General condition improved Pulse 140-160 and better quality No fluid could be aspirated from closed drainage tube. Coughing up moderate amount of thick

sputum

8-8-26—General condition still improved Pulse 102 this A. M 140 cc. blood tinged fluid aspirated from "closed drainage" tube during the day

8-9-26-About 400 cc. fluid aspirated during past 24 hrs Has become foul smelling, dark, blood tinged and, upon culture, shows streptococcus, staphylococcus and gram negative bacilli W B C for past two days, 56,000 and 51,000
8-10-26—No fluid by aspiration Xray The upper

portion of the left lung is almost fully inflated with probably a small amount of fluid in the pleural cavity surrounding the lung. The lower portion of the lung field rounding the lung. The lower portion of the lung field is considerably distorted on account of the partial extraction of the lower left lung

8-11-26—Dressing changed and all packing about ound removed Lung very foul General condition wound removed is improving all the time.

8-12-26-Left lower lobe removed with cautery and

No bleeding whatever

8-14-26—The skin sutures were removed today and when this was done, the wound practically dropped open The stump of the left lower lobe has receded somewhat but is still within an inch of the chest wall. Thoracic cavity can be seen through wound. Wound packed with dichloramine-T gauze.

8-16-26—Temperature lower W B C. 16,800

8-24-26—For the past week the patient has at least not regressed and, in some respects, has improved Eats very poorly The wound is wide open and drainage is quite profuse with a good deal of odor W B C. 15,-000 R. B C. 2,400,000 Hemoglobin 45% Cough is

Sputum practically nil moderate. Pulse still ranges about 140 though temperature is down

8-26-26-Xray Right lung clear from apex to base. Heart somewhat displaced to right The portion of the left lung remaining is apparently air containing and is held by adhesions in the region of the 2nd, 3rd and 4th ribs, posteriorly, and by more adhesions in the region of the 3rd and 4th ribs in mid-axillary line. There

Fraure 1

7-15-26—Xray does not show any appreciable displace-

ment of mediastinum or heart.

7-15-26—Increasing amount of sputum each day

is some pneumothorax surrounding the upper portion of the left lung. The detail in the lower part of left chest is confused on account of dressing and packing

8-27-26-Attempt made to make large open wound into closed drainage by covering with oiled silk through

which small tube passed into chest cavity

8-29-26-Patient has remained about the same. Pulse, however, was down to 120 this A. M and seemed better About mid-night became pulseless and quietly quality

died

No permission for post mortem examination was ob-Exploration of the thorax, through the chest wound, was carried out. The chest wound and lower portion of left chest were free from necrotic material The wound was open but showed evidence of healing The left lower bronchus was closed over by a knob-like mass of scar tissue. The left lower lobe was entirely mass of scar tissue The left lower lobe was entirely absent. The pericardium was thickened but there was no evidence of infection in the pericardial cavity collection of pus in mediastinum or any place else in the The right lung was pink and air containing from apex to base, with no evidence whatever of any pathology There were fairly dense adhesions about the left upper lobe. The lobe was air containing in upper portion Lower portion atelectatic. No bronchiectatic abscess in upper lobe

Discussion

For some time I have been thinking of a way to do lobectomy without encountering the almost innevitable virulent infection of the pleural cavity and mediastinum Lobectomy, as has been done, leaving the bronchial stump the physical changes which are the most easy to measure objectively, the condition of the skin is the most striking. Dry, brittle, scurfy, inelastic skin becomes glossy, moist, smooth and supple, in a word youthful. The hair also shows a striking change. On the head and face it grows much more rapidly and much more thickly on the trunk, limbs and pubes."

At the first International Meeting for Sexual Reform held in Berlin in 1921, Peter Schmidt demonstrated the case of a man of 34 whose bald head was distinctly covered with fine new hair only three months after the operation

In his book "The Theory and Practice of the Steinach Operation" (with reports on 100 cases), Schmidt came to the following conclusion many cases eczema and senile pruritus disappeared after the vasoligation, the skin's power of regeneration and resistance to the growths of old age were also noticed The case of the poodle,* for instance, confirmed the discovery made by Harms after transplantation The changes in the growth of hair proved to be a very constant symptom The rapid growth of the beard seems to be more frequent even than that of the hair of the head It was a matter of frequent observation that the new hair was more pigmented (darker) than before the disappearance of the pigment. In one case the growth of hair extended beyond its former limits, and in another case, the typical male extension of the public hair to the navel, first occurred after the operation"

Schmidt also reported the striking improvement of deep wrinkles in a man of 5D, clearly shown in control-photos. A distinctly hypo-gonadal man of 34 was brought to the full state of maturity by a unilateral ligation. In this case also, control-photos showed the increased hairiness of the man's body.

A case of Kauders 14 affords further excellent confirmation In his patient, age 25, the reinvigoration after ligation was general, with an increase in height and a luxuriant growth of beard and body hair

Norman Haire 15 describes in his book "Rejuvenation" four of his own cases and in two of them references as to changes in hair occur Case 1—one year after operation "His skin looks different, his ears have lost their parchment appearance. The head is free from sores, and much new hair has grown on it Case 3—The patient, a physician, reported three months po "There is not really any spectacular change, but the hair is perhaps darker, and the improved texture of the skin (this has extended to the hands) certainly gives a more youthful appearance"

Three months later he stated "There is much more vigorous growth of the axillary and pubic hair, and the latter is no longer grizzled Beard grows more rapidly" After one year he de-

clared "that the hair of head was darker, pubic hair more extensive and darker"

Klika 16 saw in a man of 80 the hair become "more pigmented and the wrinkles smoothed out"

Otmar Wilhelm has seen and reported marked changes in the growth of hair in rats, dogs and human beings Decided improvements of complexion were noticed by Knud Sand in many cases

A number of authors who have published favorable reports with the Steinach operation, have not mentioned any specific hair changes. Some of them may not have seen any, having operated too few cases. The reports of others are not detailed enough, patients having been examined only superficially.

In other instances failure to discover hair changes is doubtless due to the fact that neither patient nor doctor have paid any attention to the possibility of such changes Furthermore, patients may not have been under observation long enough Conspicuous changes in growth and pigmentation of hair frequently appear only in the second year after the operation, as my own case report will show and these changes are not the only ones that may make a late appearance Other beneficial symptoms are known to appear not infrequently only months and months after the operation considerable number of cases of vasoligation actually reported as negative as to the result, I am sure would have been classified as positive, if they had been observed for a period of, for instance, two

In my own reports (17, 18) on 114 cases published in 1925, I have called attention to the observed changes in hair and complexion in about 10 cases out of 57 that were followed up for a sufficiently long period. I feel confident that these changes would have been noticed more frequently, if I would have had the opportunity to keep a larger number of cases under observation.

According to statistics of various authors (including myself), 75 to 80 per cent of cases operated for premature or physiological senility have responded favorably. Of these cases about 20 per cent, conservatively estimated, show influence on the growth and pigmentation of hair

Beard and body hair, most of which may be classed as "sex hair" (making its appearance at the time of puberty) seem to be subjected to these changes more often than the hair on the head. The latter is controlled by the function of the thyroid and while the stronger growth of beard and body hair can be readily understood by the direct influence of an increased gonadal function after vasoligation, the improvement occasionally observed on the hair on the head is probably due to indirect thyroid stimulation induced by greater gonadal activity. Since the adrenals are believed to control pigmentation, it may be due to their indirect reactivation that the new hair is more strongly pigmented.

In the above mentioned publication, 17 I have

^{*} This is the case mentioned above

CHANGES IN HAIR FOLLOWING VASOLIGATION

By DR HARRY BENJAMIN, MD, NEW YORK

VERY conspicuous and by no means infrequent symptom appearing after a "Steinach operation" is the change in growth and color of hair. When Steinach' reported the result of his researches with vasoligation for the purpose of reactivation in guinea pigs and rats, the changes occurring in the furs of these animals were most striking and formed convincing evidence for a general reactivation having indeed taken place

Steinach summarized his observation in this "Places scantily covered with respect as follows hair and bald parts disappear Everywhere young The whole fur is again thick and hair grows glossy" Several well known photos* frequently reproduced confirmed the statement Steinach's animal experiments have been repeated by numerous investigators Different animals were used and Steinach's findings were frequently corroborated, although the explanation that some authors offered for the "rejuvenation" was not always Steinach's theory of the proliferation of the interstitial cells (his so-called "puberty gland") Among those who published confirmations of Steinach's observations, Macht & Teagarden² state after vasoligation several of the rats developed a new coat of fur, that is, "in place of the shaggy and scanty hair, the fur became more lustrous and heavier"

Regenerating effects were not only noticed in rats, but in other animals as well Knud Sand 8 described the striking changes in the hair of an old vasoligated dog (illustrated by several photos) Five months after the operation the dog was examined by Professor C H Hansen of the Agricultural High-School, who had also seen the animal before the operation and had pronounced him hopelessly senile Professor Hansen observed among other changes that "it was especially conspicuous that the hair covering had grown considerably smoother and more lustrous, the formerly extensive formation of scabs with bald parts had disappeared, the skin was more elastic and hardened spots in the skin had softened" While Professor Hansen had recommended to kill the animal before the operation, he said five months later, "that the undoubted change that had occurred in the dog was of such a character that it must be described as a peculiar sort of regeneration which could not be due to chance and that the destruction of the animal would be nonsensical at the moment'

O Wilhelm 5 found similar changes on dogs that he operated and he published many convincing photographs to that effect

P Schmidt o mentions the case of an old poodle

that he operated bilaterally

The dog was quite senile, with tremor of the hind legs, he slunk along with downcast head, the condition of the coat was bad, the skin covered all over with black warts, all interest in life and the sexual instinct gone Despite an earlier attack of apoplexy, double ligation was performed The Berlin veterinary surgeon, Dr R Kantorowicz, described the changes that set in after the opera-"Six weeks later the dog looked tion as follows healthier and the cardiac action at first rapid, had quieted down, the tremors of the hind legs had remitted very considerably. The weight increased A few weeks later the warts disappeared, later on they returned, but much smaller, less numerous and scarcely palpable through the new hair In the spring, a lively interest for bitches, which he ran after, erections occurred The growth of hair has become so beautiful and thick that it can now be clipped again in poodle fashion movements are lively and strong The tremors now occur seldom, only when excited, and then are very slight"

Others who observed changes of hair in dogs after vasoligation are Tiedje, Harms, West, Retterer and Voronoff 2 Voronoff's operations on goats and rams may be recalled here by which he produced a much thicker growth of wool, although these operations consisted of transplantations of testicles The principle, however, is the

same the increase of gonadal hormone

The number of authors who have seen changes in the fur of animals after vasoligation is much greater, and so are instances for changes in hair after transplantations. But the above examples may suffice

In man likewise vasoligation has frequently produced changes in growth and pigmentation of hair (together or without beneficial changes in the skin

and nails)

In his original publication in 1920, Steinach reported three cases which were operated by Dr Lichtenstern. In all three, changes in hair or skin were noticed. In case No. 1, Steinach reported "new growth of hair on thighs and especially in the region of the pubes. Also the hair on head and the beard was thicker. Patient has to shave more often." In case No. 2, the following report was made by the patient himself. "It seems to me a sign of my generally stronger condition that I have to visit the barber now every week for hair and beard trimming, while formerly I saw him every two to three weeks."

In his report on case No 3, Steinach said "the appearance of the patient was florid, the wrinkles

in his face were smoothed out "

Later on Lichtenstern 13 reported on 26 more cases He almost invariably noticed changes in the hair and came to the following conclusions "Of

^{*}Originally published in Steinach's "Verjuengung" 1920 (Springer, Berlin) Reproduced in Lancet, January 5th, February 2nd and February 16th 1924 in Kenneth M. Walker's article "Steinach Rejuvenation Operation" and in Kammerer's "Prolonga tion of Human Efficiency," 1923 (Boni & Liveright, New York), also various publications of Otmar Wilhelm (Santiago de Chile), etc.

the physical changes which are the most easy to measure objectively, the condition of the skin is the most striking. Dry, brittle, scurfy, inelastic skin becomes glossy, moist, smooth and supple, in a word youthful. The hair also shows a striking change. On the head and face it grows much more rapidly and much more thickly on the trunk, limbs and pubes."

At the first International Meeting for Sexual Reform held in Berlin in 1921, Peter Schmidt demonstrated the case of a man of 34 whose bald head was distinctly covered with fine new hair only three months after the operation

In his book "The Theory and Practice of the Steinach Operation" (with reports on 100 cases), Schmidt came to the following conclusion many cases eczema and semle pruritus disappeared after the vasoligation, the skin's power of regeneration and resistance to the growths of old age The case of the poodle,* for were also noticed instance, confirmed the discovery made by Harms after transplantation The changes in the growth of hair proved to be a very constant symptom The rapid growth of the beard seems to be more frequent even than that of the hair of the head It was a matter of frequent observation that the new hair was more pigmented (darker) than before the disappearance of the pigment. In one case the growth of hair extended beyond its former limits, and in another case, the typical male extension of the public hair to the navel, first occurred after the operation"

Schmidt 8 also reported the striking improvement of deep wrinkles in a man of 50, clearly shown in control-photos. A distinctly hypo-gonadal man of 34 was brought to the full state of maturity by a unilateral ligation. In this case also, control-photos showed the increased hairiness of the man's body.

A case of Kanders 14 affords further excellent confirmation. In his patient, age 25, the reinvigoration after ligation was general, with an increase in height and a luxuriant growth of beard and body hair.

Norman Haire 15 describes in his book "Rejuvenation" four of his own cases and in two of them references as to changes in hair occur Case 1—one year after operation "His skin looks different, his ears have lost their parchiment appearance. The head is free from sores, and much new hair has grown on it. Case 3—The patient, a physician, reported three months po "There is not really any spectacular change, but the hair is perhaps darker, and the improved texture of the skin (this has extended to the hands) certainly gives a more youthful appearance"

Three months later he stated "There is much more vigorous growth of the avillary and pubic hair, and the latter is no longer grizzled Beard grows more rapidly" After one year he de-

clared "that the hair of head was darker, pubic hair more extensive and darker"

Klika 16 saw in a man of 80 the hair become "more pigmented and the wrinkles smoothed out"

Otmar Wilhelm has seen and reported marked changes in the growth of hair in rats, dogs and human beings. Decided improvements of complexion were noticed by Knud Sand in many cases.

A number of authors who have published favorable reports with the Steinach operation, have not mentioned any specific hair changes. Some of them may not have seen any, having operated too few cases. The reports of others are not detailed enough, patients having been examined only superficially.

In other instances failure to discover hair changes is doubtless due to the fact that neither patient nor doctor have paid any attention to the possibility of such changes Furthermore, patients may not have been under observation long enough Conspicuous changes in growth and pigmentation of hair frequently appear only in the second year after the operation, as my own case report will show and these changes are not the only ones that Other beneficial may make a late appearance symptoms are known to appear not infrequently only months and months after the operation A considerable number of cases of vasoligation actually reported as negative as to the result, I am sure would have been classified as positive, if they had been observed for a period of, for instance, two

In my own reports (17, 18) on 114 cases published in 1925, I have called attention to the observed changes in hair and complexion in about 10 cases out of 57 that were followed up for a sufficiently long period. I feel confident that these changes would have been noticed more frequently, if I would have had the opportunity to keep a larger number of cases under observation.

According to statistics of various authors (including myself), 75 to 80 per cent of cases operated for premature or physiological sensity have responded favorably. Of these cases about 20 per cent, conservatively estimated, show influence on the growth and pigmentation of hair

Beard and body hair, most of which may be classed as "sex hair" (making its appearance at the time of puberty) seem to be subjected to these changes more often than the hair on the head. The latter is controlled by the function of the thyroid and while the stronger growth of beard and body hair can be readily understood by the direct influence of an increased gonadal function after vasoligation, the improvement occasionally observed on the hair on the head is probably due to indirect thyroid stimulation induced by greater gonadal activity. Since the adrenals are believed to control pigmentation, it may be due to their indirect reactivation that the new hair is more strongly pigmented.

In the above mentioned publication, 17 I have

^{*} This is the case mentioned above

reported as case 78, the history of a physician, age 71, who was operated on March 25th, 1924, unilaterally The diagnosis was senility I may be allowed to repeat once more the report made at that time, which was based on a written report by the doctor, received in December, 1924, nine months after the operation The patient believed to be markedly improved then, improvement having begun within a month after the operation, the first symptom being a more cheerful outlook on He says, however, that some of that might have been psychological. Nine months after the operation, his improvement was objective weight had increased ten pounds. He had much more physical strength and endurance and he was "able to do things without undue fatigue that was entirely beyond his strength before the operation " He noticed a faster growth of hair and has to see a barber more often, no noticeable change in color Skin reported less dry Sexual ability 1mproved His mental strength and endurance are better He can "study for a longer period with more satisfactory results" He can concentrate better but has not noticed any change in his memory or ambition His vertigo is very much improved He concludes his letter with the following statement, "improved in almost every way to a considerable degree"

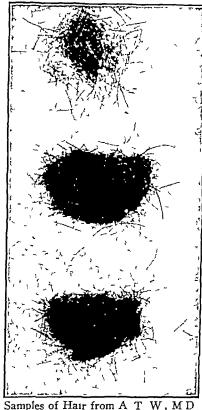

On March 29th, 1927, that means almost exactly three years after the operation, the doctor wrote me spontaneously as follows "You asked me a good while ago if my hair had darkened any At that time it had not to any considerable extent (Compare the report of 9 months p o) some of the next trimmings January 20th, 1925, again in 1926 and again yesterday, March 28th, 1927 You will notice a decided change I continue to feel fine There has been no material increase in weight for two years. I thought that you might be interested in the change that has occurred in the color of my hair" After an explicit inquiry as to the place from where the trimmings originated, the doctor stated that all samples were taken from the occipital region where the first darkening was noticed "From there," the doctor wrote, "it gradually advanced toward the front" (The samples of hair were photographed, a color-sensitive plate being used and from this photo the accompanying picture is reproduced)

The last report from the doctor is dated February 4th, 1928 (about 4 years po), in which he says, "As for myself, I believe I have nothing especially to report. There has been no material change since my last report. I continue to feel To sum up, the last three years have been infinitely more comfortable and cheerful, than the previous several"

SUMMARY AND CONCLUSIONS

In senile animals in whom the fur shows signs of old age, vasoligation produces in the majority of cases a renewed growth of hair and improvement in the appearance of the fur

In men this influence on growth and pigmentation of hair has likewise been observed in a certain percentage of those cases that have responded to the vasoligation While such a response was observed in about 75 to 80% of cases operated for the purpose of reactivation, I believe that in 20% of those an influence on the hair is effected

January 20, 1925

March 4, 1926

March 28, 1927

Operated at the age of 71 on March

The case here reported illustrates the following

It may take a year or longer until distinct signs of improvement after vasoligation may appear This applies especially to changes in the hair Inquiries or examinations for such changes should, if possible, be conducted over a correspondingly long period

Four years after the operation the patient still enjoys the benefits which he had derived fallacious idea still creeping into medical and lay literature that vasoligation causes a temporary stimulation and then a quicker decay, is again shown to be absurd

UNUSUAL REACTION AFTER INSTRUMENTATION OF URETHRA

MAURICE MELTZER, MD, NEW YORK, NY

THE routine use of urethral bougies, sounds and cystoscopic instruments rarely accompanied or followed by any Occasionally mild bleeduntoward reaction ing or varying degrees of so-called urethral shock and fever set in, even when the instruments are passed with the utmost gentleness by experienced operators Even the relative infrequency of such secondary and undesirable sypmtoms emphasize the importance of extreme gentleness in manipulations of the genito-urinary tract An unusual and severe reaction occurring after the passage of a sound demonstrates forcefully the advisability of being prepared to meet unforeseen emergencies

The sudden and unexpected appearance of wheals over various parts of the body, marked swelling and purplish discoloration of both hands extending to both forearms, marked redness of both conjunctivae, rapid pulse, dyspnea, with a sensation of air hunger and impending death-such a clinical picture is not soon for-A perusal of urological text books gotten does not reveal such similar and severe reactions This case is reported to emphasize what may suddenly be in store for patient and physician

Mr J T, age 27, a well nourished and well developed male, had been treated intermittently for a chronic antero-posterior urethritis by several physicians He has been under my care for several months. At various times he received prostatic massages, posterior instillations, urethrascopic topical applications and dilatations by sounds and by the Kollman dilator—without ever encountering any ill effects On the evening of March the 17th, 1928, sound No 28 French was passed quite easily, the

bladder having been previously filled with 1-3000 acriflavine solution The patient left the office Within five minutes he returned thoroughly frightened His face was purplishred, the conjunctive were red, varying sized purplish-red wheals were scattered over different parts of the body, both hands were swollen and purplish-red, the pulse rate was 110, dyspnea was present and he complained of a sensation of air hunger and a feeling of impending The blood pressure was 130/70 He was placed on a cot, and assured that he would soon be well again Aromatic spirits of ammonia by mouth and an intramuscular injection of ten minims of solution suprarenalin, 1-1000 were given. In about ten minutes the dyspnea, air hunger, and sensation of impending death disappeared. Thirty minutes after the onset of this unusual reaction, he was able to leave the office Some of the wheals had vanished, while a few remained scattered over the chest, abdomen and upper extremities, the conjunctivæ were still red and the swelling of both hands still persisted. For the next twenty-four hours there was general malaise and the temperature rose up to 1001/2 F wheals and the swelling of the hands gradually disappeared Seventy-two hours later he reported back at the office and was apparently none the worse for his experience. Recently, with considerable trepidation the same sized sound was again passed. No reaction of any kind followed

So-called "urethral fever" is supposedly due to a small tear of the urethral mucosa, which releases into the capillaries either bacteria, pus The absorption of either of cells or mucus these produces the usual reaction

THE KEUKA LAKE MEDICAL AND SURGICAL ASSOCIATION

Some of the principal papers read before the Keuka Lake Medical and Surgical Association on July 14th and 15th last year are published on pages 837 to 861 of this JOURNAL The meeting was not only of great value and interest scientifically, but its social features make a strong appeal to the physicians of Central New York Two or

three hundred physicians with their wives come together for a two-day meeting which combined science with pleasure

The meeting this year is being held just as the JOURNAL goes to press, and it is hoped that the papers that are read may be secured for publication in a future issue

COMMITTEE ON THE ANNUAL MEETING

Opinions regarding the annual meeting of the Medical Society of the State of New York are as varied as those of the five blind men when they first came in contact with an elephant Each doctor is likely to judge the whole meeting by one feature in which he has been especially interested or disappointed

If he was a delegate to the House of Delegates and secured approval for a favorite scheme,

the rest of the meeting was rosy to him

If a member heard a scientific talk which impressed him deeply, he was happy through all the sessions as he discussed the paper with every friend whom he met

If some feature of the commercial exhibit appealed to his hobby, he personally spent his time

leading his friends to his favorite booth

If a member met a half a dozen of his classmates whom he had not seen for thirty years, he and they have vowed to return next year and the year afterward

If the skies were balmy and the golf courses green, the sporty doctor swore that he never had attended such a satisfactory annual meeting

This JOURNAL of April 15, 1926, carried an editorial entitled "Ideals and Actualities of the Annual Meeting," which showed that 360 participants were listed on the formal program of

that year

The direction and execution of a program in which 360 physicians participate is a task requiring both skill and effort. The number of those that take part in the program is over one-third of those who attend the meeting, and the number of participants and variety of activities have both considerably increased in the last two years. However, there is likely to be a one-sided interest in the meeting, for each of those who take part will be interested in that particular feature which he attends and will neglect the other features.

The number of those interested in the special features of the annual meeting varies from over two hundred in the scientific sections to less than a dozen in the exhibits. There is need of coordination and balance in making out the program and in arousing a greater number to take an interest in all features of the annual meeting.

The program of the annual meeting is in the hands of four groups

1 The officers.

2 The Committee on Scientific Work,

3 The Committee on Arrangements,

4 The Publication Committee

The officers have formal charge of the meetings of the House of Delegates, the Anniversary Meeting, and the Banquet, but the formal responsibility for most of the other activities of the meetings lies with the members of the other three groups

The scientific programs are in charge of the Committee on Scientific Work and the officers of the nine scientific sections. About 25 percent of those registering their attendance in the annual meeting take part in the scientific program, and the sessions are therefore popular and well attended, for every participant has his own circle of admirers. The result is that the scientific program is the most attractive feature of the annual meeting.

The physical arrangements for all the various meetings and features of the annual meeting are in the hands of the Committee on Arrangements Theoretically, the Committee cannot function properly until all the plans for the meeting have been made, but practically, the committee must be consulted in regard to each feature of the meeting. It must know how much space each section and feature requires, and when the space will be needed, in order that it may provide the proper accommodations and personnel to carry on the activity

The Committee on Arrangements usually consists of local men chosen from the city in which the annual meeting is to be held, and it is told what to provide after the program has been outlined. The committee often finds it difficult to provide the sections and exhibits with meeting rooms which are readily accessible. Experience has shown that when the places of assembly are scattered throughout a city, some of them will not be patronized. The place of each meeting and the adaptability of its accommodations must always be considered.

The fourth group consists of those who manage the exhibits The scientific exhibit each year has been conducted by a very few individuals. While they have always produced exhibits which are models of completeness and design, yet their work is often passed with too little notice because only a half dozen physicians have been responsible for its designing and execution. The problem of creating interest in the scientific exhibit is one which must be faced and solved.

The planning and management of the commercial exhibits have been in the hands of only about a half dozen persons, consisting of the advertising manager, the publication committee, and the editors of the JOURNAL When only these few individuals have a responsible interest in the exhibits, it is not strange that few doctors go out of their way to visit the booths, yet the commercial exhibits are of great importance to the Society not only for their intrinsic worth but on account of the income from the rent of booths There is great need that the commercial exhibits be given wider consideration in the plans for the annual meeting and for publicity regarding its features

When any one feature of the annual meeting

is considered, it is usually found to have been well planned and managed, and the results from it have been in proportion to the amount of publicity that has been given to it. No feature of the annual meeting will run itself. There must be preparation for it and wide publicity of its nature and objects. According to this standard, the scientific sections are well cared for, while the exhibits are in need of more publicity and of greater cooperation, with all the groups responsible for the annual meeting.

The members of the House of Delegates and the officers of the State Society have realized the need of coordination in planning and conducting the annual meeting. They, therefore, approved a special committee to study the needs of the annual meeting and advise the officers and committeemen who have it in charge. This committee consists of the President-elect, Dr. James N. Vander Veer, the Speaker of the House of Delegates, Dr. John A. Card, and the Secretary of the Society, Dr. Daniel S. Dougherty. It will doubtless receive the enthusiastic cooperation of all those who are responsible for the program, and the support of the members who will be stimulated to attend the annual meeting.

PREVENTION OF RICKETS

The controversy regarding the comparative value of sunlight and cod liver oil in the prevention of rickets can easily be settled by the advice to give both to every infant. Cod liver oil has the physical advantage of being always available and the physiological value of affording something to take. No matter how well educated people are, they still want to "take something" and feel that they have been neglected, if they cannot swallow something from a spoon. Then, too, cod liver oil is as nearly a specific as any drug which is classed under that heading

If sunlight were costly, the people would gladly pay large prices for it, but since it is free, its value is not appreciated. Mothers often suppose that fresh air is the therapeutic agent sought when they wheel their sleeping babies on to the front porch. Even when they place the carriage

in the sunlight, they cover the child's eyes and so exclude the very rays which bring health. It therefore happens that when sunlight is given, cod liver oil also is usually necessary

The active principle of cod liver oil, if there is one, has been eagerly sought and some observers think they have found it, and are putting it in the form of tablets having strange names which appeal to mothers because of their mysteriousness. The latest development is the preparation of an artificial anti-rachitic product consisting of ergosterol that has been exposed to ultra-violet light. But a most striking fact is that the use of old fashioned plain cod liver oil is enormously on the increase and manufacturers are showing their faith in it by putting up great additions to their plants.

LOOKING BACKWARD

This Journal Twenty Years Ago

This Journal for July, 1908, contains an editorial on Dr George Huntington, and says

"We have always been of the opinion that the best time to do honor to a man, who is worthy of honor, is while he is alive, the ears of the dead are deaf Neurographs, Vol 1, No 2, 1908, actuated by this principle, devotes a whole number to the discussion of hereditary degenerative chorea, commonly known as Huntington's chorea, and to the man whose name has been given to this disease

"It is good to know that the man who first gave the classic description of this disease, and whose name is now committed, for all time, to the nomenclature of science, is an honored general practitioner of medicine at Hopewell Junction, Dutchess County, New York, preferring the simple life of a country practitioner, with the advantages of rural life for his children, to the stress of the city—Born at Easthampton, N. Y.

where his father and grandfather had practiced medicine before him, he has continued the period of practice of three generations, which began one hundred and eleven years ago

"It is wise and profitable for medicine to take notice, now and then, of the men who have contributed the new things to the knowledge of our science. Among these is Dr. George Huntington to whom we wish long life and many more years of usefulness."

This JOURNAL for December 1, 1926, page 997, carried a brief note regarding the family in which a member of the fourth generation is now practicing medicine, Dr Edwin H Huntington, of Ossining If there is any other doctor of New York State who is of the fourth—or even the third—generation of medical practitioners, this JOURNAL will do honor to him and his medical forebears

MEDICAL PROGRESS

Rheumatoid Arthritis - Mary L H Arnold Snow, writing in Physical Therapeutics, May, 1928, Ivi, 5, defines rheumatoid arthritis as a toxic polyarthritis of gastroenteric origin, aggravated at times by other local infections Its outstanding characteristic is that it is usually bilateral when acute, but always affects both sides when chronic, which leads one to question its connection with the spinal cord duction of the fingers at the metacarpophalangeal articulation, due to muscular spasm attendant on pain, is distinctive of rheumatoid Bodily tone is improved by the use of radiant light and heat, preferably by the carbon arc lamp, these modalities promote circulation, increase elimination, and lessen pain Hepatic stasis, always present in rheumatoid arthritis is overcome by the static wave current or by diathermy Lymph stasis is relieved by the use of radiant light and heat, mechanical vibration, or the static sparks and brush dis-Muscular tension is treated with the static wave current followed by static sparks and mechanical vibration The d'Arsonval current may be applied over the fingers motor disturbances and especially blood pressure derangements are favorably affected by mechanical vibration In addition, regulation of the life, habits, and environment of the patient is necessary A properly balanced low protein diet should be prescribed according to the physical needs of the individual patient Frequent exercise short of fatigue is an important factor in the treatment. High colonic flushings should also be a part of the routine The use of the static wave current per rectum or the conical vibratode favors relaxation of a tight sphincter Gastroptosis and enteroptosis require a proper rigid support Kinks or malalignments are treated by the sinusoidal wave and the wave generator Under treatment with these physical measures, only the most advanced cases resist improvement, and even these are made more comfortable. All other patients are benefited or restored to the normal activities of life

Tonsillectomy in Hyperkineses—Dr Wichura, a laryngologist of Bad Oeynhausen, appears to have inaugurated a new phase of the focal infection problem, inasmuch as he claims as a result of years of observation that acute tonsillitis may be a decided factor in the causation of certain diseases of the central nervous system. In his historical development of the subject he characteristically almost ignores American authors. Many years ago Gerhardt

traced acute rheumatic infections to acute tonsillitis, but later Gürich showed that the acute attack of tonsillitis was merely an exacerbation of a chronic lesion In 1909 Pässler spoke of a permanent tonsillar infection as a cause of nervous and visceral disease and even counselled tonsillectomy for chorea This doctrine fell flat at the time, but a recent article by A Salomon shows by figures that in the great majority of cases of chorea a septic factor is responsible However the author with a few others has profited by this teaching and during the last 12 years he has enucleated the tonsils repeatedly for diseases of the nervous system, and he mentions several others who The diseases have followed the same course thus treated comprise chorea, sciatica, multiple sclerosis, myelitis, epilepsy, etc., but as the title of the paper indicates that the kind of nervous disease most likely to be benefited by treatment is the hyperkinetic which comprises especially chorea, myoclonus, epilepsy, etc. there appears to be no doubt that ablation of the infected tonsils can at least cause long remissions in these hyperkineses are not the only site of focal lesions for the same results may follow sinus infection and indeed any other septic focus -Munchener medizinische Wochenschrift, May 4, 1928

Meralgia Paresthetica — James H Huddleson, writing in the American Journal of the Medical Sciences, June, 1928, clxxv, 6, describes this clinical syndrome as combining paresthesias, pain and some objective sensory disturbance (hyperesthesia or hypesthesia) over the anterolateral surface of the thigh, usually extending nearly to the knee Subjectively, the patient complains of numbness, coldness, burning, tingling, or pain Trophic disturbances of the skin may occur, though less often than Meralgia paresthetica may result from sundry types of lesions that may be at one time both irritative and partially destructive, acting on the peripheral nerve, on the dorsal root or its ganglion, or within the dorsal horn on the cell bodies of the sensory neurone of the second order Among the etiological agents are trauma and pressure on the nerve, such as that exerted by intra-abdominal tumors, the pregnant uterus, or simple obesity Constitutional influences that may affect the sensory nerves in meralgia include vascular complications from local conditions, various intoxications, infection, and pelvic inflammatory The marked variations in the extent and exact location of the affected area are ex-

plainable by the fact that, besides peripheral anastomosing of the lateral cutaneous nerve with the anterior crural, genitocrural, and so forth, the former may itself arise from the first and third as well as the second lumbar root Treatment will of necessity vary with the eti-Where surgical intervention is not indicated, the following physiotherapeutic combination has proved effective in some cases Radiant light and heat to the thigh and leg, followed by massage of the outer side of the thigh, blue pencil (static brush) discharge along the course of the external cutaneous More radical measures are the Roentgen rays, alcohol injection into the sheath of the nerve, formalin injection, and excision of the nerve in obstinate cases The histories of two cases are cited one patient suffered from a bullet wound of the upper thigh, the other was exposed to pressure from the edge of a table while at work

Serum Treatment of Scarlet Fever—Prof U Friedemann and Dr H Deicher of the Infectious Disease Department of the Rudolf-V rchow Hospital, Berlin, in an article on this subject, state that the mortality in the severe and severest cases in which alone the serum was exhibited, amounted to 35 per cent, but if cases complicated by septic infection are excluded there was no mortality. This result must be regarded as extremely favorablemore so in fact than in the serotherapy of malignant diphtheria The total number of patients thus far submitted to serum treatment 18 455 As for complications the authors show that the serum treatment reduces not only the number but the severity of them, apparently by about one-third Serum disease is unfortunately common and the authors saw it develop in 132 out of the 455 cases no mortality nor severe morbidity but the urticarial rash which so often develops is very tormenting to the sick patient. A special analysis of the 16 deaths shows that 5 could not have been due to the scarlet fever organism, for in 2 cases death resulted from severe burns, in 1 from erysipelas, in 1 from grippe-bronchopneumonia, and in 1 from puerperal sepsis 7 other cases with complications the serum was applied at so late a period that a positive result was out of the question In the other 4 cases the patients might possibly have been saved by intravenous exhibition of the serum but as all 4 had recently received injections of diphtheria serum there was fear of anaphylaxis The patients who died were in extremis when admitted, almost pulseless, and the serum which was injected intramuscularly probably never reached the point of absorption -Deutsche medizinische Wochenschrift, May 25, 1928

Sodium Bicarbonate in Tetanus - Professor Paul Heim, a pediatrist of Pécs, discusses the influence of this salt given perorally and intravenously in tetanus. Our therapeutic resources against this malady are very modest as shown by the mortality The author sees an average of 6 or 7 cases a year and experience teaches that it is not the plan of treatment which decides the outcome but the length of the incubation period. He has not seen a single recovery when this was under 7 days, while in the recovered cases the period has always been longer than 7 days Despite the preventive value of the serum the author has not been able to convince himself that it has influence over the established disease might act on the toxin before the latter is anchored if this is possible If it succeeds in prolonging the disease a new fatal element is introduced for then numerous complications have a chance to develop, notably bronchitis Heim has tested the sodium and pneumonia bicarbonate treatment on 6 patients with 5 re-Evidently, according to his previous statement, the incubation period was favorable in the recovered cases and the claim for the sodium treatment is limited to shortening the hospital sojourn, for we read that all five recovered patients were able to leave the hospital in from 2 to 3 weeks. In two other patients (making 8 in all) who were adults, the first series of 6 having all been children, the sodium was tested but was unable to save life although it certainly appeared to benefit the spasms for some days. In the recovered cases the action on the spasms was much more manifest for the type of disease was milder Although there was no relaxation of the jaws some of the other muscles lost much of their But while certain, the action was rigidity transitory although by persistent use the duration of the disease, as already stated, was greatly abbreviated The doses were 30 to 40 grams of soda daily, or 40-70 cc of 10 per cent solution for infusion —Klimsche Wochenschrift, April 22, 1928

Bone Development and Age as Shown by Rontgen Studies—Professor E Stettner sums up an article on this subject as follows. The relationship between the actual age and stage of skeletal development may be considered as an individual problem and as a matter of averages. Rapidity of development and regularity of development alike have to be taken into account. Pathological experiences naturally may interfere with development and the rontgenograms often serve to throw light on past accidents. The author apparently is concerned only with the child, although forensic importance is, we believe, more attached to older periods.

pathological conditions and hardly alludes to rickets and other maladies involving the skeletal system The paper then is chiefly anthropological, dealing only with biological variation He insists that the stage of development of the skeleton is not a measure of the development of the organism as a whole Much space is given to the teeth, not so much in themselves as because the character of dentition everts a notable influence on skull shape. The round face of the nursling is the result of its narrow jaw and the defective development of the as-Development of jaws and cending ramus teeth changes the shape from round to oval so that maldevelopment here may cause extensive departures from the normal Hypertrophy of the tonsillar ring is quite distinct from malformation of the bones but each may react on the other, causing vicious circles close relationship between assimilation of food and calcification, the former being essential for the latter, so that general disturbances of nutrition may arrest dental development Caries, especially when precocious, should depend on some deep seated anomaly of nutrition of the references cited by the author are of recent date and suggest that rontgen control of skeletal development may ultimately prove of value in pediatric practice -Deutsche medizinische Wochenschrift, April 27, 1928

Demonstration of Electric Fields in the Vicinity of the Body -F Sauerbruch and W O Schumann announce that they have succeeded in demonstrating the existence of an electrical field in the vicinity of certain portions of the animal body, the maximum distance being more than two meters The original research, begun three years ago, had for its objective the discovery of a possible electromagnetic field in the vicinity of the body The results were submitted to physicists and physicians of Vienna who gave the benefits of their counsel The phenomenon is possibly due to differences of potential in the skin or contiguous structures In 1902 Heydweiller reported some phenomena, which differed from the present, in which he used a quadrant electrometer to detect what he assumed to be due to gradually originating and disappearing static charges The article is very brief-a preliminary communication in the interest of priority claim Several photographs of curves are given, the first of which is produced by tetanizing a rabbit with strychnine while the others proceed from the human body, the subject making rapid movements with the fingers while the arm is passive, the position being changed in various ways The so-called action stream must originate in the contraction of large muscle masses The very defective character of the report such as lack of all description of the apparatus used and how the results were obtained will perhaps be made good in a subsequent article. It is at present impossible to predict whether this discovery will have any practical importance in medicine—Munchener medizinische Wochenschrift, April 20, 1928

Influence of Hormones on Cell Chemistry -Professor J Wohlgemuth enumerates the three methods of studying hormone activity —by injecting the hormones into the subject and studying any metabolic changes, by extirpating the hormone-producing organ and studying the deficiency symptoms, and finally by bringing them into immediate contact with the living cells The two first methods have long been known, but it is only recently that Warburg has shown us how to carry out the third with scientific accuracy. Through his efforts we have learned how to measure cell The author has respiration and glycolysis for some years been studying the action of hormones on the cutaneous cells, and has been able to show that, with the exception of insulin and hypophysin, all hormones stimulate the respiration of these cells The thyroid hormone in one series of experiments was able to increase this activity 450 per cent same power was shown to exist in the case of Next in order came liver and kidney cells the gonads while adrenalin everted only a slight action Insulin which has no ability to stimulate the respiration of the cells of the skin, liver, or kidneys, was found to exert a positive action on the cells of the grey matter of Another field of study is the power of various hormones to change levulose into lactic acid which is carried out chiefly in the placental cells Thyroxin, adrenalin, and folliclin acted strongly in this respect, insulin was less powerful, while thymin was still weaker and hypophysin quite inert The author intimates that hormones act upon enzymes naturally present in the various cells to produce these diverse effects Apparently there is a reversed action when the hormones are exhibited in a certain excess, large doses inhibiting where small ones stimulate —Deutsche medizmische Wochenschrift, May 18, 1928

Postvaccinal Encephalitis—V Mikulowski of Warsaw sums up the results of personal experience and the most recent conclusions of others on the relationship of this encephalitis to the ordinary epidemic encephalitis of Economo The cases seen in England in 1912 antedated the outbreak of the latter malady by some years and when this did appear almost synchronously in various parts of the world it was not associated in any way with vaccination. It was not until 1920 that postvaccinal encephalitis was recognized on the Continent,

and several years elapsed before it was again observed, this time with some cumulative tend-In certain cases, especially in the one which has been followed up by the author, the clinical resemblance to the epidemic type was close and it is quite possible that some of these postvaccinal cases have belonged to this type It is not generally known that many years ago Heubner placed on record the fact that in rare instances vaccination seems to have precipitated attacks of acute anterior poliomyelitis when the latter was epidemic. In other cases, however, the disease which has followed vaccination has not corresponded to the epidemic form and we now realize that there are various affections of the central nervous system of infectious origin which form a group characterized by the presence of some unknown neurotropic virus. It seems to have been shown positively that the virus of variola has of itself no neurotropic action and can only cause encephalitis by arousing to activity some slumbering secondary virus, the eliciting factor being vaccination allergy As a practical measure the author would withhold vaccination in the presence of community cases of encephalitis, poliomyelitis, etc, as well as in children feverish from unknown causes, and in children showing evidence of scrofulosis and the exudative diathesis - Schweizerische medizinische Wochenschrift, May 19, 1928

Tar Anaphylaxis and Anaphylactic Migraine —W Berg of the internist clinic of Rostock University mentions several familiar forms of anaphylactic asthma, such as the ipecac sensitiveness of druggists and the sensitiveness of fur dyers to paraphenylaminediamine He next describes a form seen in asphalters in which both asthma and migraine are provoked by some constituent of the asphalt, this term being used here only in the generic sense, for several different substances are employed, such as ground bitumen and coal tar It became evident that the allergen was in the latter When the anaphylactic subjects were made to inhale the latter experimentally a pronounced eosinophilia developed with the clinical evidences of asthma and migraine, the latter associated with nausea, teichopsia, and other familiar accom-With repetition of tests the symppaniments toms increased in severity. It was possible to mitigate the severity of the attacks by previous intravenous injection of 10 per cent calcium chlorate, which fact may be placed in relationship with the subnormal proportion of calcium Control subjects who were not in the blood sensitive complained of nothing more than conjunctival irritation. Up to the present the actual allergen has not been isolated, but the fact that an affection like migraine has been shown to be anaphylactic in part at least is of much interest. The author claims that he is the first to make a complete demonstration of this fact, but is silent on cases which have been ascribed to food sensitiveness—we recall in this connection subjects who develop migraine after eating chocolate—but possibly the demonstration has been incomplete in these cases—Kluische Wochenschrift, April 29, 1928

New Data on Lipoid Nephrosis -Hans Knauer states of this relatively new disease that many authorities doubt its status as an exclusive renal affection Back of it there may be a general disturbance of the total metabolism affecting the protein, fat, and mineral interchange. In other words the accumulation of lipoids in the blood is not a secondary consequence of renal insufficiency In seeking for the source of this disturbance of metabolism the author has studied the liver function, despite the fact that this has always been thought of in association with carbohydrate metabolism alone He found from examination of the blood of patients that there was always hypoglycemia This suggests either an overfunction on the part of insulin or an insufficiency of adrenalin In the meantime the author starts off on quite a different tack, referring to the absence from the blood of lipoidnephrosis patients of the normal trypanocide This was constant for all patients principle examined and again points to an hepatic dys-In lipoid nephrosis there is a disturbance of diuresis and water retention and this in turn has been brought into association with disturbed liver function The patients, all of whom by the way appear to be children, showed an abnormally low blood pressure which was only slightly and temporarily increased by adrenalin exhibition studies have shown more and more that fats are formed in the body from carbohydrates, and it is even claimed that all excess of unoxidized carbohydrate becomes fat At a recently reported autopsy on a subject with lipoid nephrosis there was marked infiltration of the liver with fat The low blood pressure of lipoid nephrosis contrasts vividly with the high tention of acute glomerulonephritis. At the present time it appears that lipoid nephrosis represents a general disorder of metabolism of which the rationale is lacking -Khnische Wochenschrift, May 20, 1928

LEGAL

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

THE POLICE POWER

HIS, the fifth in our promised series of editorials, has to do with that much used and frequently misunderstood term, "the police power" To those entirely unfamiliar with this term, it should first be stated that the term must not be confused with any mere power or authority of a municipal or local police. The police power is the power of government itself to promote and safeguard the public health, morals, safety, order and general welfare of its citizens "Police power," says Corpus Juris, "is the power inherent in a government to enact laws, within constitutional limits, to promote the order, safety, health, morals, and general welfare of society plied to the powers of the states of the American Union, the term is also used to denote those inherent governmental powers which under the federal system established by the constitution of the United States are reserved to the several states "1

The definition given by the highest court of Oregon has been widely accepted. The Oregon court declared. The police power is "The name given to that inherent sovereignty which it is the right and duty of the government or its agents to exercise whenever public policy, in a broad sense, demands, for the benefit of society at large, regulations to guard its morals, safety, health, order or to insure in any respect such economic conditions as an advancing civilization of a highly complex character requires"²

The Minnesota courts have defined the term as "The power to impose such restrictions upon private rights as are practically necessary for the general welfare of all "3" While the Supreme Court of the United States has declared that the police power means "Nothing more or less than the powers of government inherent in every sovthat is to say power to govern men and things"4 The Illinois courts have defined the term as "that inherent and plenary power in the State which enables it to prohibit all things hurtful to the comfort, safety and welfare of society"5 The interesting definition given by Sir William Blackstone has been quoted by our New York Court of Appeals with approval Blackstone's definition is "the due regulation and domestic order of the Kingdom, whereby the individuals of the state, like members of a well-governed family, are bound to conform their general behavior to the rules of propriety, and good neighborhood and good manners, and to be decent, industrious and inoffensive in their respective stations "6"

This inherent power of the government existed before any of our constitutions were adopted "All authorities," says our New York Court of Appeals, "agree that the Constitution presupposes the existence of the police power, and is to be construed with reference to that fact "7 While this is true, the fact remains that most of the law upon this subject was developed during the nineteenth century, and especially the latter half of it 8 The police power "may be put forth in aid of what is sanctioned by usage, or held by the prevailing morality or strong and preponderant opinion to be greatly and immediately necessary to the public welfare." The existence of this power, -a power which is always exercised by the legislature—has been held to justify the enactment of laws designed for the protection of the public to guard against some danger, real or anticipated, in our social or commercial life 10

There is one limitation upon the exercise of this power, however, which should not be forgotten, and that is that the exercise of this power is not a justification for the enactment of a law contrary either to the state or to the federal constitution. But in determining the question whether a given law is properly enacted under the police power, the general and long continued belief as to its desirability or necessity "must be considered in determining its constitutionality."

In one celebrated case in the United States Supreme Court, Chief Justice Waite declared "When one becomes a member of society, he necessarily parts with some rights or privileges which, as an individual not affected by his relations to others, he might retain 'A body politic,' as aptly defined in the preamble of the Constitution of Massachusetts, 'is a social compact by which the whole people covenants with each citizen, and each citizen with the whole people, that all shall be governed by certain laws for the common good' This does not confer power upon the whole people to control rights which are purely and exclusively private, but it does authorize the establishment of laws requiring each citizen to so conduct himself, and so use his own property as not unnecessarily to injure another This is the very essence of government, and has found expression in the maxim sic utere tuo ut alienum non laedas From this source come the police powers, which, as was said by Mr Chief Justice Taney in the License Cases,

R74

nothing more or less than the powers of government inherent in every sovereignty is to say the power to govern men and things' Under these powers the government regulates the conduct of its citizens, one towards another, and the manner in which each shall use his own property, when such regulation becomes necessary for the public good "13 In another celebrated case in the Supreme Court of the United States, it was said that "the police power extends to all the great public needs put forth in aid of what is sanctioned by usage, or held by the prevailing morality or strong and preponderant opinion to be greatly and immediately necessary to the public welfare "14

In the case of People v Mulford, decided in New York in 1910, the question before the court involved the constitutionality of the statute declaring it a misdemeanor for one to practice medicine without a license promptly declared that statute constitutional, and quoted the following language from the United "The power of the State States Supreme Court to provide for the general welfare of its people authorizes it to prescribe all such regulations as, in its judgment, will secure or tend to secure them against the consequences of ignorance and incapacity, as well as of deception and fraud. As one means to this end it has been the practice of different States, from time immemorial, to exact in many pursuits a certain degree of skill and learning upon which the community may confidently rely, their possession being generally ascertained upon an examination of parties by competent per-The nature and extent of the qualifications required must depend primarily upon the judgment of the State as to their neces-If they are appropriate to the calling or profession, and attainable by reasonable study or application, no objection to their validity can be raised because of their stringency or difficulty

Few professions require more careful preparation by one who seeks to enter it than that of medicine It has to deal with all those subtle and mysterious influences upon which health and life depend, and requires not only a knowledge of the properties of vegetable and mineral substances, but of the human body in all its complicated parts, and their relation to each other, as well as their influence upon the mind physician must be able to detect readily the presence of disease, and prescribe appropriate remedies for its removal Every one may have occasion to consult him, but comparatively few can judge of the qualifications of learning and skill Reliance must be placed which he possesses upon the assurance given by his license, issued by an authority competent to judge in that respect, that he possess the requisite qualifications consideration, therefore, for the protection of society may well induce the State to exclude from practice those who have not such a license, or

who are found upon examination not to be fully qualified "15

There can be no dispute among reasonable men as to the propriety for exercising the police power in regulating lawyers, doctors and other profes-Of late, however, questions have arisen strengthening the police power beyond anything heretofore imagined Thus, for example, in the recent so-called rent law cases, the constitutionality of the New York statute, which temporarily fixed reasonableness as the standard of rent, and suspended the property owner's right to invoke the remedy of summary proceedings for dispossess, came before the courts This legislation was upheld both by our Court of Appeals and by the United States Supreme Court The property owners contended that the law was unconstitutional in that it deprived them of their property without due process of law, denied them the equal protection of the law as guaranteed by the Fourteenth Amendment to the federal constitution, and took private property for a private use without compensation in violation of the New York State constitution Our Court of Appeals, and later the Supreme Court of the United States, overruled all of these contentions, Pound, J, of the Court of Appeals declaring "the state may establish regulations reasonably necessary to secure the general welfare of the community by the exercise of its police power although the rights of private property are thereby curtailed and freedom of contract The legislative or police is abridged power is a dynamic agency, vague and undefined in its scope, which takes private property or limits its use when great public needs require, uncontrolled by the constitutional requirement of due Either the rights of property and contract must when necessary yield to the public convenience, advantage and welfare, or it must be found that the state has surrendered one of the attributes of sovereignty for which governments are founded and made itself powerless to secure to its citizens the blessings of freedom and to promote the general welfare "16

Here was a broader exercise of the police power than any heretofore invoked. Here is the clear statement that this power under certain circumstances may be invoked, and when so invoked, is "uncontrolled by the constitutional requirement of due process". As to the impairment of contract by virtue of this legislation, Judge Pound further said. "The provision of the Federal Constitution that no state shall pass any law impairing the obligation of contracts puts no limit on any lawful exercise of legitimate governmental power. The rule alike for state and nation is that private

The full alike for state and nation is that private contract rights must yield to the public welfare, when the latter is appropriately declared and defined and the two conflict "IT Further the court declared "The field of regulation constantly widens into new regions. The question in a broad and definite sense is one of

LEGAL

degree As no similar legislation has been construed by the courts, precedent is of little value and may prove misleading. The question comes back to what the state may do for the benefit of the community at large. The struggle to meet changing conditions through new legislation constantly goes on. The fundamental question is whether society is prepared for the change. The law of each age is ultimately what that age thinks should be the law.

Judge McLaughlin filed a strong dissenting opinion in the case just referred to, holding that the rent law violated both the federal and state "The police power,' he said, "is not superior to the Constitution, on the contrary, it is subject to applicable constitutional limitations "10 The safeguards of the state and federal constitutions, he continued, "cannot be overthrown by the exercise of the police power, a power which no one has as yet attempted accurately to define or state just where it commences or ends seems to me much better to adhere strictly to the Constitution, the anchor of good, safe and sound government, rather than to embark on the sea of paternalism, the dangers of which cannot be fore-seen or the perils foretold '20 To many lawyers, the dissenting opinion of Judge McLaughlin has seemed sound law To them, it has seemed difficult not to conclude that the court in the rent law cases held that the guaranties and safeguards of the constitution are subordinate to the legislature's exercise of the police power

When the rent law cases were before the Appellate Division in this case, Presiding Justice Clark dissented from the opinion of the court upholding "Recognizing," he said, "that such legislation the courts have never yet laid down the limitations of the police power, all of the cases which I have been able to examine dealing with the subject make that power subject to the Constitution my judgment, the acts under consideration in these cases violate the fundamental principles of the State and Federal Constitutions, in that the result is either to take private property for public use without due compensation, which is not permissible, or to take private property for private use, which has never been allowed "21

As we survey this great power of government, still vague and undefined, we may well pause to reflect as to what its ultimate limitations may be held to be "The field of regulation constantly widens into new regions," said Judge Pound in the case previously referred to 22 What new fields will be surveyed by state legislators where the exercise of this power, and to what extent this exercise may "widen," future chroniclers alone can tell us Will the time finally arrive when the legislature will be held immune from constitutional restraint in accordance with the English system? "We have arrived at a point," one court has said, "where in an emergency there are no

property rights which are not subject to the police power of the state. The legislature is the exclusive judge of the existence of an emergency. Every person who carries on a business emerges from his privacy and owes an obligation to the community in the conduct of his business." "To uphold private contracts and to enforce their obligations," declared the Supreme Court in a case previously cited, "is a matter of high public consequence, but the legislature has a wide latitude in doing what seems in accordance with sound judgment and reasonableness in order to bring about a great good to a large class of citizens, even at some sacrifice of private rights"²⁴

The police power may be well defined as the sleeping giant of the constitution. No doubt, its exercise, as in the rent law cases, was wise and for the public good. But is the time to come when the legislature may strike down our constitutional protections upon the theory that in so doing the good of the many is attained at the sacrifice of the few? If that time ever comes, constitutional government, as heretofore understood in this country, will have gone

LONDON LETTER

HARVEY TERCENTENARY CELEBRATION

May 14th to 18th, 1928

The Congress held in London, under the auspices of the Royal College of Physicians, to celebrate the Tercentenary of the publication of Harvey's immortal "De Motu Cordis," is over, and has left on all the delegates—both those attending from the Mother Country, and those from foreign countries—an imperishable England is at her best in conducting memory ceremonies where dignity and simplicity are the key notes, and from the moment of the gracious Reception of Delegates by His Majesty the King at Buckingham Palace, to the last gathering at the Rooms of the Royal Society at Burlington House, the proceedings were conducted without the vestige of a hitch, nor was anyone conscious of the working of the machine The interest of our Royal House was manifested by the reply of the King to the address presented to him at the Reception at Buckingham Palace, and by the delightfully informal presentations to His Royal Highness, the Prince of Wales, which took place at the hall of the Worshipful Company of Merchant Taylors on the following day It was characteristic of the Prince of Wales that he should mingle with the great throng of Delegates and their ladies, and Fellows of the Royal College of Physicians and their guests, and that he should chat in their own tongue with the foreign representatives, having a happy word and a smile for many of those known to him That was a wonderful evening spent in this beautiful old Hall in the heart of the City, a Hall decorated with crystal chandeliers which have no equal in the world One of the French Delegates said to me, "Ah! this is too wonder-We have nothing of this kind in our country" And indeed the City Companies are in a way peculiar to the City of London oldest of them were founded in the 13th century, and were known as "Gilds" or "Misteries' Their functions were analogous to the modern Trades Unions in that each governed its particular trade and formed a "middle man" organization In them one sees the rise of the middle classes, and at one time they wielded a great political power which was not confined They soon acquired to the City of London meeting places or Halls-generally by buying the mansion of a feudal family, or the buildings of a religious community Of the two Halls in which the Delegates were entertained, the Grocers' Hall was built in 1431, on the site

of the mansion of a member of the famous Fitz-walter family, who in earlier days had held Baynard Castle and had led the Civic forces to the field by hereditary right. The Hall suffered severely in the Great Fire of London in 1666, and although it was repaired at the time, another building (the present Hall) was erected in its place between 1798-1802

The Merchant Taylors built their Hall in 1331, on the site of the mansion of Sir Oliver de Ingham, who defended Bordeaux against the French for Edward III, but the present Hall dates only from 1671, five years after the Fire The City Companies have long ceased to govern their trades, but some of them are very wealthy and use their funds for education and for charities of many kinds Most of the Companies have Halls of great antiquity, which form oases of peace in the very midst of the hustle of London traffic, and in which can be seen priceless plate, pictures, and tapestries of unique beauty

Perhaps the most impressive ceremony was witnessed the first day, when the Delegates were received at the Royal College of Physicians by the President, Sir John Rose Bradford Academic costume was worn, and some wonderful robes were seen, and I fear that our British robes were in many cases outshone by those worn by some of the foreign Delegates To celebrate the occasion the Royal College of Physicians created, for the first time in its long history, four Honorary Fellowships, and conferred them with appropriate formality upon Lord Balfour (who was unfortunately unable to be present owing to a temporary indisposition), Sir Ernest Rutherford, OM (President of the Royal Society), Professor Pavlov of Leningrad, and Professor Dr K. F Wenckebach of Vienna Eulogies of Harvey were pronounced by Sir Charles Sherrington Professor Chauffard (who spoke in English), and Professor Dr Keibel, who delivered his address in German In the evening the Delegates were entertained to Dinner by the Grocers' Company in their Hall, the toast of the Delegates being in the very able hands of the Master of the Rolls I had the pleasure of sitting near Professor Dr Mondrakowski of Warsaw, who seemed to be as much interested in English Folk Songs as in the great scientific work upon which he is engaged!

On the mornings of the second and third

days, there were series of Demonstrations arranged by the Royal College of Physicians in the Physiological Department of University College Here was shown the "Harvey Film," a reproduction of Harvey's original experiments displayed by cinematograph. The film was demonstrated by Sir Thomas Lewis and Dr. H. H. Dale, to whom the greatest credit is due for an exhibition so dramatic that it became the talk of the Congress. Everyone was expressing the hope that the film may be "released" to a wider audience of medical men and students

On the second day the Delegates were entertained to luncheon in the Great Hall of St Bartholomew's Hospital (Harvey's Hospital), by the Governors and Staff, and to those of us who were Bart's men the occasion was most impressive The Hospital has been on its present site since 1123, but the Hall dates back only to 1730 It is approached by a wide staircase, upon the walls of which are two large paintings by Hogarth, representing the Pool of Bethesda, and the Good Samaritan dignified structure, rather dingy in its ornamentation to those who do not know it and love it, but it has some fine pictures, of which the best are the Perceval Pott by Sir Joshua Reynolds, and the well-known picture of Abernethy by Sir Thomas Lawrence, while among the more modern portraits those of Sir James Paget and Holden by Millais are the most noticeable A large painted window dominates the wall opposite the entrance, it is a representation of King Henry VIII delivering a charter to the Lord Mayor of London in 1547 and was made early in the Seventeenth Cen-In 1710 a wire frame was placed over the window and during the air raids of 1917 it was solely due to this 200-year old frame that this window alone escaped uninjured when all the others in the Hall were destroyed

To Sir Wilmot Herringham was given the honor of delivering the address on Harvey He spoke of Harvey's long connection with the Hospital, of his daily doings, and his home life, and included a tale of his parrot which he

eventually dissected How Harvey got into disfavour with his colleagues because he accompanied Charles I to the Wars, and how he was for the same reason deprived of the honour of election to the Presidency of the Royal College of Physicians, Sir Wilmot brought vividly before his hearers, and with many touches of humour paid tribute to this, the greatest of Bartholomew's men

The greatest function of all took place on the third evening, when the Royal College of Physicians gave a banquet in the ancient Guildhall, to the Delegates, Fellows and guests Some 500 sat down to a typical City banquet, and the evening was enlivened by some of the finest speeches that can ever have been heard in this great hall Perhaps the most eloquent speech was that of Professor Castiglione, representing Harvey's old University at Padua Replying to the toast of the Delegates, mostly ably proposed by the Minister of Health, Professor Castiglione made his opening remarks in English, and then concluded with a wonderful rush of oratory in his own Professor Welch of Baltimore, whom everyone was delighted to welcome here again, in quieter vein, but with great charm and beauty of diction, joined in thanks for the So great was the esteem shown for that wonderful veteran, Professor Pavlov, that when his name was mentioned, the applause lasted for many minutes, to the surprise and embarrassment of the aged Professor, whose modesty is proverbial Professor Wenckebach and Sir Ernest Rutherford replied for the Honorary Fellows, and the Archbishop of York proposed the Royal College of Physi-The outstanding figure in this week of celebrations seems to be that of Sir John Rose Bradford, the President of the Royal College of Physicians, whose quiet dignity and graceful oratory made a great impression on us all and made us feel that in him the Royal College has a worthy leader

H W CARSON

NEWS NOTES

THE COUNCIL

The Council of the Society of the State of New York is composed of thirty-one members consisting of elective general officers, the trustees, the chairmen of the standing committees, and the Editor-in-Chief of the New York STATE JOURNAL OF MEDICINE Its members represent every activity of the State Society, and they discuss all the various phases of work in which the Society is interested The Council functions as a legislative, executive, and also judicial body While the supreme power of the Society centers in the House of Delegates, composed principally of representatives from the county medical societies, the Council carries out the details of the matters which have been passed by the House, such as the appointment of committees

The Council meets only three or four times a year—once immediately after the House of Delegates, and a second time in about a month, and again nearer the winter, but it assigns eight of its members as an Executive Committee which functions largely as the cabinet of the Governor of the State This Executive Committee meets once a month and attends to details of business as they develop The system of organizing the Medical Society of the State of New York is logical and experience has demonstrated it to be both practical and satisfactory

The second meeting of the present Council was held on June 21 in the Headquarters of the Society in the building of the New York Academy of Medicine, 2 E 103rd Street The following is a general description of the proceedings of that meeting

The first business was reports from the Standing Committees Dr Frederick E Sondern reported for the Committee on Medical Research, and emphasized the point that the Anti-Vivisectionists were increasingly active and powerful in promoting laws forbidding the use of live dogs for surgical operations in the course of research The activities are directed principally against the use of dogs, and they make less objection to the use of other animals Physicians must consider this fact and do all they can to avoid giving the antis any ground for complaint Dr Sondern advised against the use of dogs as subjects except in investigations in which dogs are necessary, as in the investigation of heart con-The Council expressed itself in favor of the suggestions of Dr Sondern

Dr Thomas P Farmer, for the Committee on Public Health and Medical Education, gave a detailed report of the courses of instruction which his Committee had given under the auspices of county societies He outlined a new type of instruction in which an entire day would be devoted to clinics and talks in a hospital, conducted by eight or ten instructors. He said that the Committee was now studying the records of attendance at the courses that have already been held, and was endeavoring to find out the opinions of those in attendance in order to judge the value of the courses and the developments which should be made in order to increase their effectiveness

Dr Farmer announced that the personnel of his Committee would be the same as that of last

year

Dr Farmer also reported for Dr Britt that the Committee on Economics would adopt Workmen's Compensation as its major activity, and that the promotion of Periodic Health Examinations would be conducted by the Committee on Public Health and Medical Education

Dr J N Vander Veer, Chairman of the Committee on Arrangements for last year, reported in considerable detail on the Annual Meeting He emphasized the necessity that the Annual Meeting should be conducted in accordance with a permanent policy. He approved the action of the House of Delegates to appoint a committee to devise a plan and assign to it the responsibility for co-ordinating all phases of its execution.

The discussion of plans for the Annual Meeting brought up the subject of the exhibits, both commercial and scientific, at that meeting. The management of the Exhibits seems to have been confined to the bringing of the Exhibits together, while there has been a neglect of the essential duty of inspiring the members with a deep interest in the exhibits. The point is that the Exhibits were splendidly arranged, but that the members did not attend them in anywhere near the numbers which were expected.

Dr O S Wightman, Editor-in-Chief, discussed the relation of the New York State Journal of MEDICINE to the manufacturers and dealers taking part in the Commercial Exhibits that the Editors and the Business Manager compose almost the entire personnel which deals with the advertisers, and that the Annual Meting affords the only opportunity that the Society had of coming in contact with the advertisers goodwill and friendship of the dealers had been secured during the past two or three years, and the proof of this fact is the constantly increasing receipts from the advertisers in the Journal However, the Annual Meeting had shown that there was still very much to be done in order to increase the interest of the members of the State Society in the exhibits and advertising

to provide the incentive or the facilities for the securing of an audience for the exhibitors had resulted in an expression of dissatisfaction by the dealers and manufacturers. It would prevent the sale of exhibit space at the meetings, and it would be likely to effect the future of advertising in the JOURNAL.

Both Dr Vander Veer and Dr Wightman urged that steps be taken at once to put into effect the action of the House of Delegates in providing for a committee "to study the question of the Annual Meeting in all its phases, and to draw up certain general rules for guidance relative to the conduct of the Committee on Arrangements" (This JOURNAL, July 1st, page 805) The Council appointed as such Committee, Dr J N Vander Veer, President-Elect, Dr John A Card, Speaker, and Dr D S Dougherty Secretary

er and Dr D S Dougherty, Secretary
Mr Lloyd P Stryker, Counsel for the State Society, referred to the attitude of the American Medical Association in regard to the Advertising Department of the several state journals, in all of which, except those of New York and Illinois, the advertisements were secured and controlled by the Cooperative Medical Advertising Bureau of the American Medical Association Mr Stryker especially referred to the statement in the minutes of the annual Meeting of the A M A, published in the Journal of the A M A of June 23, page 2033, which reads as follows "It is to be hoped that the few State Journals which do not cooperate and which have different advertising standards, will make every effort to cooperate with this Bureau" There was considerable discussion over the advertising pages of the New YORK STATE JOURNAL OF MEDICINE and of the Journal of the A M A, and the consensus of opinion was that the New York State Journal OF MEDICINE was conforming to the spirit of the standards of the American Medical Association

Dr A J Bedell, Chairman of the Committee on Scientific Research, spoke of the need of cooperation between the several Standing Committees in order that his Committee might know what arrangements to make with the speakers as early as possible. He also suggested some of the possible changes in the time-honored plan of the section meetings in order to bring them up to date. One possible innovation was that of holding meetings of the Sections in the morning and a general meeting of all sections in the afternoon. The decision regarding the outlined plan of the Annual Meeting will lie with the Special Committee on the Annual Meeting.

A number of items of routine business received attention, especially those which had been referred to the Council by the House of Delegates

The President was authorized to appoint a representative of the State Society to meet with representatives of the New Jersey and Pennsylvania societies, and devise means of publishing a medical directory under the joint auspices of the three States (See the Minutes in this Journal, July 1st, Section 7)

The appointment of a committee on Membership, referred to in Section 44 of the Minutes, was tabled, for the Council felt that each county siciety was sole judge if the election of its members

The time and place of holding the Annual Meeting was left to the Executive Committee. The final decision will depend on the judgment of the Special Committee on Annual Meeting, for there is strong evidence that the success of the Annual Meeting will depend on holding all parts of the meeting under one roof.

It was voted that the Committees on Nursing and on Diphtheria, of both of which Dr N B Van Etten is Chairman, be continued

COURSE IN THE PROBLEMS OF OLD AGE

The Medical Problems of old age will be considered in a Graduate Fortnight Week of the New York Academy of Medicine next fall during the two weeks beginning Monday, October first An announcement of the course was made on page 276 of the March first issue of this Journal and since that time, the plans for the course have been nearly completed and are announced on advertising page vi of this Journal The course has been arranged to suit the convenience of physicians generally Clinics will be given in hospitals in three sections of New York simultaneously,uptown, middle New York, and downtown,while lectures will be given in the Academy of Medicine, 2 East 103rd Street, in the late afternoon and early evening, with provision for supper

to those who wish to stay at the Academy Physicians from out-of-town will be welcome at the clinics and lectures and no fee will be charged

The treatment of diseases of old age has never become a popular specialty, although physicians formerly used the term geneatrics to denote that specialty. The word comes from the Greek geron, an old man, and is homologous to the Greet root, paid, a child, in the word pediatrics. The exact title of the course is "The Problem of Aging and Old Age." There seems to be come controversy regarding how to spell the word aging. Orthographists who conform to the letter of the rules of spelling insist on dropping the final e before the ending. Which do you prefer, aging or ageing?

THE MEDICAL PRACTICE ACT IN OPERATION

When the Medical Practice Act was passed in 1926, its successful application was doubted by many who based their pessimistic views on the well-known tendency of officials to avoid activities which were not mandatory. Fortunately the law charged a particular State Department with the duty of investigating complaints regarding the illegal practice of medicine, and furthermore provided the funds with which the officials might work. The Department of Education and the Attorney General have quietly organized and perfected the machinery of enforcement and have tested it in a variety of cases during the past year with excellent results.

The June issue of *The Panel*, the monthly Bulletin of the Association of Grand Jurors of New York County, published at 105 West 40th Street, New York, contains an article on the Medical Practice Act by Mr Sol Ullman, Deputy Attorney General of the State of New York, who directs prosecutions under the law Mr Ullman says

"The essential object of any Medical Practice Act is to provide properly trained physicians for the care of the public and machinery for the licensure of such physicians, the revocation of licenses and the prosecution of those illegally practicing medicine. To properly function, a unified program is necessary, and that all business of the State as to educational requirements, licensure and the conduct of physicians as well as criminal prosecutions for illegally practicing medicine be centralized in one bureau

"That was the program of medical legislation of the 1926 legislature of the State of New York, as embodied in the 'Webb-Loomis' bill which is commonly known as the 'Medical Practice Act'"

"The outstanding feature of the Act is the provision for a 'Committee on Grievances'

"Several proceedings have been instituted by the Grievance Committee against licensed physicians charging misconduct in the practice of medicine. As a result thereof, the licenses of a number of physicians have been revoked Other complaints are now under investigation

"There is a striking difference between the procedure in disciplinary proceedings against an attorney at law and those against a physician. In the case of an attorney, the Appellate Division of the Supreme Court, to which complaints are sometimes made in the first instance, refers the complainant to the Bar Association for investigation and action. The Bar Association, through its Grievance or Corresponding Committee, hears the complaint on

the testimony of those witnesses who are willing to attend before it That Committee has no power of subpæna, whereas in the case of a physician, the Grievance Committee has such power After a hearing before the Grievance Committee of the Bar Association, if in its opinion, there is some basis to the complaint against an attorney, charges are presented to the Appellate Division, which refers the matter to an official referee The referee hears the witnesses in support of and in defense to the charges, and then makes his report to the Appellate Division, which either confirms or rejects same So that in the case of an attorney charged with unprofessional conduct, there are two hearings, only one of which hearings has legal authority, whereas in the case of a physician who is charged with misconduct, there is but one hearing and that is based on legal authority

The Medical Practice Act has proved to be a most effective weapon against those unlawfully practicing medicine Since its enactment, numerous illegal practitioners of medicine have been prosecuted in the criminal courts practically every instance, the prosecution resulted in conviction, either on a plea of guilty or after trial These illegal practitioners were ferreted out and the evidence in most of the cases was procured after considerable difficulty was experienced by the inspectors of the Department to whom great credit is due inspectors were compelled at great risk to submit themselves to various forms of treatment at the hands of inexperienced and illegal practitioners in order to procure the legal evidence against them

"Evil doers will continue to resort to medicine as a fertile field for unlawful gain, unless all arms of the administration of justice of the State of New York properly and timely cooperate Such co-operation can come principally from the Courts of Justice A Justice of the Court, on finding a litigant guilty of perjury, sends the record to the District Attorney He also sends the record of a case tried before him to the Bar Association where the lawyer has been guilty of unprofessional conduct. Just so should a Justice promptly report to the Education Department the 'crooked' physicians or illegal practitioners who have appeared before the court in any guise

"That the Medical Practice Act is serving its purpose is best evidenced by the fact that shortly after same was passed, and at or about the time investigations were being conducted, many illegal practitioners pulled up stakes and went to places elsewhere. It is estimated that over a thousand were driven out in the year 1927."

SCHOHARIE COUNTY

The semi-annual meeting of The Schoharie County Medical Society, held in Hotel Baker, Schoharie, N. Y., Tuesday May 8, 1928, was well attended and of great interest, with the President, Dr. Meleatus Bruce, in the Chair. The report of the Committee on By-Laws was made and a copy of the newly revised by-laws were presented to each member present.

The following nominations as officers of the society for 1929, were made President, Dr C L

Olendorf, Cobleskill, Vice President, Dr C F Wharton, Richmondville, Treasurer, Dr LeRoy Becker, Cobleskill, Secretary, Dr H L Odell, Sharon Springs

After luncheon the following scientific program was carried out "Feeding During the First Year With Reference to Some of Its Problems"—Dr R J Wharton, Johnson City, "Surgical Prognosis of Cancer of the Breast"—Dr E MacD Stanton, Schenectady

HERBERT L ODELL, Secretary

MONROE COUNTY

The regular meeting of the Medical Society of the County of Monroe was held Tuesday, May 15, 1928, and was noteworthy for the large attendance of the members and for the exceptional interest which was, deservedly, accorded the speaker of the evening, Dr George B Magrath, of Boston, Mass, whose subject was "Some professional experiences in Medicine, as applied to the uses and purposes of the Law" Dr Magrath related in a fascinating manner case-histories of the investigation of a number of criminal cases, with which he had been connected in his official capacity as Medical Examiner of the Suffolk District of Massachusetts These were illustrated

with excellent slides of photographs. The attorneys of the county had been especially invited to attend and a large number of the legal profession was present, including the President and other officers of the local Bar Association. The paper was discussed by Messrs Strang, Dick and Weldgen of the Bar Association and by Drs Winslow, Fitch and Wentworth

The evening was a most enjoyable one to all concerned and we can most highly recommend both speaker and subject to any of the County Societies, desiring an entertaining and instructive addition to their program

J P HENRY, Secretary

HERKIMER COUNTY

The semi-annual meeting of the Medical Society of the County of Herkimer was held at Pine Crest Sanitarium Tuesday afternoon, June 5, 1928 Despite rainy weather a large attendance was present President Dr F H Moore called the meeting to order at 3 40 P M Reports were read by Secretary Dr Brooks, and by Drs Sabin and Santry of the County Laboratory Committee It was pointed out that the Common Council of Little Falls had waived its rights according to law for the establishment of a Laboratory by it. This clears the way for the Board of Supervisors to adopt a resolution to establish the County Laboratory, the cost and maintenance of which is met one half by the State and one half by the County

Many of the physicians reported that large numbers of people of their acquaintance and clientele were strongly in favor of the County Laboratory and unless action is taken by the Board of Supervisors soon, publicity and numbers of indorsements will be secured

Dr Eveleth of Little Falls reported that the milk dealers of that city were very strongly in favor of the County Laboratory

Dr Sabin, the delegate to the State Convention at Albany, gave a very interesting report of the State Society's recent meeting

The Society went on record as favoring the re-

porting of T B cases by the attending Doctor instead of by Dr Parkinson

Dr Fagon, the treasurer, reported the Society to be in excellent financial condition. It was also pointed out that the Society will entertain the District Branch meeting in Herkimer next year

At the Scientific Session Dr Parkinson, 2nd Vice President, gave an interesting paper on the Treatment of Pulmonary Hemorrhage, followed by much discussion

Dr Matthias Nicoli, State Commissioner of Health, arrived at 5 P M and addressed the Society upon many timely subjects. The workings of the State Department were made clear and many important points brought out. A vote of thanks was accorded to Dr Nicoll for his timely address.

After the Scientific Session a delicious chicken dinner was served and the meeting adjourned at 7 30 P M

The following Doctors were present

Drs — Moore, McEvilly, Diss, Crofts, Santry, Newton, Sabin, Griffiths, Parkinson, Strobel, Barney, Wood, U G Williams, Fagan, Vickers, Garlock, Petrie, Eveleth, Love, Murray, Brooks, and State Health Commissioner, Dr Nicoll

WILLIAM B BROOKS, Secretary

THE MEDICAL PRACTICE ACT IN OPERATION

When the Medical Practice Act was passed in 1926, its successful application was doubted by many who based their pessimistic views on the well-known tendency of officials to avoid activities which were not mandatory. Fortunately the law charged a particular State Department with the duty of investigating complaints regarding the illegal practice of medicine, and furthermore provided the funds with which the officials might work. The Department of Education and the Attorney General have quietly organized and perfected the machinery of enforcement and have tested it in a variety of cases during the past year with excellent results.

The June issue of *The Panel*, the monthly Bulletin of the Association of Grand Jurors of New York County, published at 105 West 40th Street, New York, contains an article on the Medical Practice Act by Mr Sol Ullman, Deputy Attorney General of the State of New York, who directs prosecutions under the law Mr Ullman says

"The essential object of any Medical Practice Act is to provide properly trained physicians for the care of the public and machinery for the licensure of such physicians, the revocation of licenses and the prosecution of those illegally practicing medicine. To properly function, a unified program is necessary, and that all business of the State as to educational requirements, licensure and the conduct of physicians as well as criminal prosecutions for illegally practicing medicine be centralized in one bureau

"That was the program of medical legislation of the 1926 legislature of the State of New York, as embodied in the 'Webb-Loomis' bill which is commonly known as the 'Medical Practice Act'"

"The outstanding feature of the Act is the provision for a 'Committee on Grievances'

"Several proceedings have been instituted by the Grievance Committee against licensed physicians charging misconduct in the practice of medicine. As a result thereof, the licenses of a number of physicians have been revoked Other complaints are now under investigation

"There is a striking difference between the procedure in disciplinary proceedings against an attorney at law and those against a physician. In the case of an attorney, the Appellate Division of the Supreme Court, to which complaints are sometimes made in the first instance, refers the complainant to the Bar Association for investigation and action. The Bar Association, through its Grievance or Corresponding Committee, hears the complaint on

the testimony of those witnesses who are willing to attend before it That Committee has no power of subpœna, whereas in the case of a physician, the Grievance Committee has such power After a hearing before the Grievance Committee of the Bar Association, if in its opinion, there is some basis to the complaint against an attorney, charges are presented to the Appellate Division, which refers the matter to an official referee The referee hears the witnesses in support of and in defense to the charges, and then makes his report to the Appellate Division, which either confirms or rejects same So that in the case of an attorney charged with unprofessional conduct, there are two hearings, only one of which hearings has legal authority, whereas in the case of a physician who is charged with misconduct, there is but one hearing and that is based on legal authority

The Medical Practice Act has proved to be a most effective weapon against those unlawfully practicing medicine Since its enactment, numerous illegal practitioners of medicine have been prosecuted in the criminal courts practically every instance, the prosecution resulted in conviction, either on a plea of guilty or after trial These illegal practitioners were ferreted out and the evidence in most of the cases was procured after considerable difficulty was experienced by the inspectors of the Department to whom great credit is due inspectors were compelled at great risk to submit themselves to various forms of treatment at the hands of mexperienced and illegal practitioners in order to procure the legal evidence against them

"Evil doers will continue to resort to medicine as a fertile field for unlawful gain, unless all arms of the administration of justice of the State of New York properly and timely cooperate Such co-operation can come principally from the Courts of Justice A Justice of the Court, on finding a litigant guilty of perjury, sends the record to the District Attorney He also sends the record of a case tried before him to the Bar Association where the lawyer has been guilty of unprofessional conduct. Just so should a Justice promptly report to the Education Department the 'crooked' physicians or illegal practitioners who have appeared before the court in any guise

"That the Medical Practice Act is serving its purpose is best evidenced by the fact that shortly after same was passed, and at or about the time investigations were being conducted, many illegal practitioners pulled up stakes and went to places elsewhere. It is estimated that over a thousand were driven out in the year 1927."

A

THE DAILY PRESS

FOURTH OF JULY FATALITIES

The Fourth of July fatalities in former years have often exceeded those of a minor battle of the Civil War They frequently reached such alarming figures that New York City passed an ordinance forbidding the sale of fireworks within the City limits But numerous bootleg booths have been set up just over the City line and the City noisemakers secured enough ammunition to supply statisticians with mortality and morbidity figures The New York Sun, for July 5, says

"The Fourth of July, the police agree, was a 'safe and sane' Independence Day—comparatively There were twenty-three deaths by drowning, five in automobile accidents, four from fire-

works and three from heat, and more than 300 persons were injured by fireworks and thirty-eight in motor mishaps

"These casualty totals are smaller than in previous years—last year, for instance, there were 1,600 injured and 14 deaths from fireworks—and the city was considered especially fortunate in view of the record number of celebrants who joined in the festivities attending the nation's birthday"

The City ambulance doctors had an unexpectedly easy day. The Kings County Hospital ambulance, for example, was called to only one case of burns by fireworks—a record undreamed of five years ago.

CHILDREN OF THE STREET

The New York Times of June 18, makes a rather sarcastic comment on the following list of children's activities on the streets of New York City,—as revealed by a report of the Regional Plan Committee

Gathering wood Selling papers Shining shoes Selling from push carts Minding fortune-telling parrot Carrying bundles Building fires Hitching on autos Throwing stones Craps Matching picture cards Matching pennies Playing with old tire Riding bicycles Taking care of baby Playing ball Jumping rope Marbles Tag Rolling hoops Tip cat Climbing fences Making mud pies Sailing boxes in gutter

Roller skating Running around

The New York Herald-Tribune of June 20 uses the same report to make the following editorial comment on the need of recreation beaches to counteract some of the activities indulged in by rhildren in the City streets.

children in the City streets

"The Regional Plan of New York and Its Environs will shortly issue a report on the subject of foreshore and rights in land under navigable waters which should awaken us all to the idiotic short-sightedness of such a policy. It will present the results of a survey of the present ownership of land under water in New York, New Jersey and Connecticut, trace the laws involved from pre-Revolutionary days on, and describe how the three states might recover for public recreational purposes much of the water front in the region of New York which is at present restricted to the use of private owners

"It is hardly necessary to point out the urgency of this report and of the action that should follow it. Every day the recapture of this property is postponed adds to the price which must be paid for it out of the public treasury. In the mean time if the public would benefit by the investment it should also take steps to end the pollution which makes an open sewer of the waters.

MEDICAL WARES

GLANDULAR EXTRACTS

The history of glandular extracts is a record of the development of modern medicine in its scientific exactness The first glandular extract to be put to commercial use was rennet in the manufacture of cheese When the nature of the digestive process was first dimly understood, pepsin and other digestive ferments were placed on the market This consisted of the desiccated glands and of liquid extracts, and they often produced results which exceeded those of a mere digesting action These actions were largely classed as tonic After a winter's diet of grain and salted meats, the people often lacked vigor, and spring fever was a well-known form of laziness which was treated by the use of certain tonics days when nothing was known of vitamines, the tonics had a satisfactory effect as soon as spring greens appeared on the diet list fects of the greens were ascribed to the tonics,and there was ground for belief in those consisting of extracts of the stomach, intestine, and pancreas

The first glandular extract which was placed on the market was known as proteonuclein which was prepared by Reed & Carnrick, the pioneers in glandular therapy Proteonuclein consists of extract of various glands including the suprarenal, The object of the manuthyroid and pancreas facturers was to get an extract which should contain as great a quantity of nuclein as possible, for it was supposed that the virtue of the medicine resided in the proteins of the nuclei of the cells In the light of modern knowledge, it is seen that proteonuclein contains the specific extracts of certain glands which are necessary for the wellbeing of the body The thyroid extract, for example, is well known to have a remarkable tonic effect on those patients whose thyroid is deficient

The thyroid was the first ductless gland whose functions were clearly demonstrated, and thyroid extract is now a well-known article of commerce whose effect is as standardized as digitalis. Adrenalin and insulin are two other glandular extracts whose production is standardized, and whose effects are known with certainty

A ductless gland is called an endocrine from the Greek krino, to separate Its active principle is called either a hormone, from the Greek hormao, to excite, or an autacoid, from the Greek alos, a remedy

As a knowledge of the endocrines developed, the functions of other glands were discovered and their extracts were applied in medicine. The

pituitary gland, for example, is used to promote the contraction of uterine tissues, but it has other actions in regard to the growth of individuals whose practical application has not yet been placed on a commercial basis The ovaries and the mamary glands, the testicles and the prostate all produce hormones, which have marked effects on the body although they cannot be expressed with accuracy in any given pathological condition of a human being These facts may all be classed under the head of what was formerly called tonic, which simply means that while their effects are known in certain conditions, yet they are not always diagnosable in our present state of knowl-But to condemn the use of these extracts on the ground that their action is not always explainable is as illogical as to advise their indiscriminate use in all conditions of low vitality

The organs of external secretions, such as the liver and kidneys, also produce hormones similar to those of the endocrine glands. A kidney, for example, whose secreting cells are degenerated and replaced with connective tissue cannot produce an internal secretion which is necessary for the wellbeing of the body. The theory is that the use of the extract of the normal kidney will supply the body with an unknown substance which it needs, and these expectations are frequently realized in practice.

The use of liver in pernicious anemia has become popularized to such an extent that everybody who is anemic buys liver, with the result of raising its price until a breakfast of liver and bacon is a luxury Extracts of the liver have been prepared and used, but without much practical success. There are those who say that the effect of liver diet is due to the slight percentage of copper which is present in the organ.

An immense amount of research is going on regarding endocrines, and their hormones Among the leaders in this research are the firms which prepare products for glandular therapy. The better class of firms engaged in this work maintain laboratories and research workers which would do credit to any medical college.

The effects of endocrine deficiency are seen daily by every physician, and are undergoing clinical investigation in every hospital, especially those devoted to the treatment of children who are mentally defective. It may be expected that with the development of a knowledge of the functions of the endocrines glands, a similar development will take pice in the therapeutic application of the extracts and hormones of these glands.

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

- International Clinics Edited by Henry W Cattell, A M M.D Thirty-eighth Series Volume II Octavo of 344 pages, with illustrations Philadelphia and London, J B Lippincottt, Company, 1928

"But if the daisies in their hay accomplished what the Hessians could not, we presently paid the Old World back, sending it in our turn a lovely weed to cause admiration and trouble. Over in American hay traveled our Western black-eyed Susan, a member of the same great compositae

family, but bearing a different name, Rudbeckia hirta. It was eagerly cultivated in gardens until it showed what it could do without assistance And to-day the American daisy in Europe, and the European daisy in America, nod complacently "The field is ours"

DRUG ADDICT CURES

Narcosan for the cure of drug addicts, about which both the newspapers and the medical journals gave much space in the daily newspapers in December, 1926 (see this JOURNAL, Feb 1, 1927, page 144), has been used quietly in some of the City hospitals of New York The New York Herald-Tribune of June 26 carries the announcement that Mayor Walker has appointed a committee to study the problem of the treatment of drug addiction Narcosan is among the remedies to be investigated

"The committee consists of Dr William R

Williams, chairman, Dr. Mathias Nicholl, Jr. State Commissioner of Health, Dr. Louis I Harris, City Commissioner of Health, Dr. Menas S. Gregory, head of the Bellevue Hospital psychopathic ward, Dr. Israel Straus, chairman of the Jewish Mental Health Society, Dr. Linsley R. Williams, director of the New York Academy of Medicine, Dr. Nathan R. B. van Etten, past president of the State Medical Society, Dr. Stanley R. Benedict, of the Cornell University Medical School, Dr. Thomas A. McGoldrick and Dr. Alexander Lambert."

UNFADING DYES

The New York Times of July 3 quotes from the Home Economist, by F E Sears, and prints extracts regarding the dyes used by ancient people Times says

"Our ancestors dyed their cloth with extracts from barks, berries and various mineral salts. The method was laborious and the results uncertain. Contrary to some present-day beliefs, the old natural dyestuffs were not the equal in any way of our present-day products. Some of them were fairly fast colors and others were very poor. The range of colors was very limited and no bright clear shades were available.

"'How often we hear of the mythical splendor of the Roman robes dyed with Tyrian purple!' Scientists, it is added, have obtained small amounts of this ancient dye from its source, a small shell fish which thrives in the Mediterranean Sea, and have found it a shade of purple so dull that it would have no use in competition with

present day anilines, which are brighter and

"Other persons have written of the fastness of dyes used in cloths found in the mummy cases of the tombs of Egypt which have endured for centuries. As a matter of fact, says the author, these cloths were dyed with very fugitive colors, but were sealed in tight chambers away from air and light in Egypt's extremely dry climate which was ideal for their preservation. Chemists, it is asserted, have analyzed the dyes from some of these cloths and found them to be tumeric and saffron, natural dyes which have almost no fastness to either light or washing.

"As a final blow to the ancient art, it is said that a great many of the historic materials have been found to fade almost white in a comparatively short time even when carefully preserved in fairly dark rooms in various museums. The author makes only one exception, admitting that indigo was the only fast dye which the ancients

knew and used"

FOOD PREJUDICES

Unconscious cerebration and the persistence of early impressions in the subconscious mind form the basis for many food prejudices. The New York Sun for June 27 has an editorial discussion of these food prejudices, basing its comments on an article by Dr. Charles W. Townsend in the Scientific Monthly. The editorial says

"Dr Townsend might have taken as his text the presence on both sides of the Atlantic of soft-shelled clams and edible mussels and the odd behavior of Europeans and Americans in the presence of this equal gift Americans eat the clams and disdain the mussels, Europeans eat the mussels and disdain the clams In the case

of Europe the prejudice is known to be an ancient one, for delvers in the kitchen middens of Europe have found almost no clam shells anywhere in the British Isles or on the Continental mainland

"Prejudice against foods is one of the blindest members of a shortsighted tribe. The child rebels against foods, perhaps because they are not savory, or perhaps merely on the ground of their unfamiliarity. Unless he is being brought up on the sound old-fashioned rule of 'Eat what is set before you,' he is likely to grow up with a deeprooted prejudice against some of the most delicious foods."

tions New York. The Macmillan Company, 1927 Cloth, \$12 00

The progress of the knowledge of plastic surgery, stimulated by the necessities of the deformities and injuries resulting from the carnage of the World War, has been truly marvelous, and probably no more horrible nor distressing types of injury require the surgeon's aid than those that occur about the face, and especially the orbit. The knowledge that, because of facial deformity, one is constantly the object of curious, horrified or even discussed observation, is a form of torture far worse than pain, and to be able to bring some measure of relief to the sufferer of such forms of mental or physical anguish, while at the same time restoring in a measure lost function, is a cause for the deepest gratitude on the part of the patient, and a keen sense of satisfaction to the surgeon

Dr Sheehan's large experience in this field of Surgery has well equipped him to present in book form the best that is known of facial plastic surgery

The book is planned in an orderly and intelligent manner, and could hardly be more complete and satisfying to a student of this specialized branch of surgery

In the opening part the author deals with the anatomy and the physiology of the contents of the orbit, including a detailed study of the skin and the mucous membrane, as well as the nerves, vessels and sympathetic system.

Part two deals with different methods of tissue grafts, including the preparation and the after-care, giving details that are so often not sufficiently emphasized in works of this character

Part three includes a description of operative procedures, with accompanying illustrations of classical and

personal cases

The book as richly illustrated in color, photograph, and diagram with plates showing the anatomy, operative technique of the more frequently employed methods of grafting, and of varied procedures adopted for even the lesser deformities that may result from trauma or infection about the orbital region.

The work is quite satisfying and complete, and one can hardly be too profuse in its praise.

Roger Durham

HANDBOOK FOR THE MEDICAL SOLDIER OF THE REGULAR ARMY, NATIONAL GUARD, ORGANIZED RESERVES, AND ENLISTED RESERVE CORPS OF THE ARMY OF THE UNITED STATES BY ARNOLD DWIGHT TUTTLE. Approved by the Surgeon General of the Army 12mo of 691 pages, illustrated. New York, William Wood and Company, 1927 Flexible leather, \$500

Gen Merritt W Ireland, the Surgeon General of the Army of the United States writes, concerning this volume, as follows "This book is a most illuminating, comprehensive, and up-to-date presentation of the basic knowledge we desire our enlisted men to possess. I heartily recommend its use by all medical soldiers, by their instructors and by all others interested in medicomilitary preparedness." This volume of 700 pages includes everything necessary for the medical soldier to know, and will be to him the same as Gray's Anatomy to the medical student—his Bible. Without one unnecessary word, the author gives a historical survey of our form of government, of the Constitution of the United States and of the meaning of patriotism. He has presented army duties in addition to the necessary instruction in the care of the wounded soldier. The book is most thorough and should be used by all who may be interested in our Army.

A Text-Book of Practical Therapeutics with Especial Reference to the Application of Remedial Measures to Disease and their Employment upon a Rational Basis By Hobart Amory Hare B Sc., M.D. Twentieth Edition, revised Octavo of 1094 pages, illustated Philadelphia, Lea and Febiger, 1927 Cloth, \$7.50 This book, now in its twentieth edition, has fulfilled

the wants of the student and practitioner for so many years that it is hardly necessary to give a lengthy description of its contents. In the present revision some new drugs have been added such as metaphen, ephedrin, isasen, and pollen pastes for diagnosis. The status of bismuth in the treatment of the later stages of syphilis is fully discussed and likewise some of the newer serums.

The Therapeutic Index makes the book ideal for quick reference on most all therapeutic problems and saves

much time and unnecessary reading

It is one of the most practical books of to-day and worthy of a place in the library of every physician

3 S

Exposures of Long Bones and Other Surgical Methods By Arnold K. Henry, M.C., B.Ch. Octavo of 80 pages, illustrated New York, William Wood & Company, 1927 Cloth, \$3.50

Experience, from time to time, brings problems to the surgeon that can be solved by no text-book method nor rule of thumb, and individual ingenuity is an asset of large value at such times.

Dr Henry presents in a series of monographs, assembled in this volume original avenues of approach to the shafts of the long bones, to the Popliteal space, the Plantar structures, the Vertebral and left Sub-clavian arteries, and a new method of resection of the left cervico-dorsal ganglion of the sympathetic and of Pituitary surgery Dr Henry developed the technique described by combined clinical experience, and anatomical study and dissection.

Any surgeon who is likely to encounter any of these problems will find valuable hints that may aid materially in their solution, and the illustrations from dissection make the text amply clear ROGER DURHAM

LE METABOLISME BASAL. Ses Applications en Clinique. By CLAUDE GAUTIER and RENE WOLFF 16mo of 172 pages Paris, Gaston Doin & Cie, 1928 Paper, 15 francs

This is an interesting survey of the subject of metabolism in health and its changes in diseased states. The authors have made a complete study of the literature and here present the pertinent findings and the present significance of the past work.

With improvement and simplification of the methods of basal metabolism determinations, there has grown up an increasing interest on the part of the general practitioner, to follow up such studies

This little volume will interest the general practitioner Henry M Feinblatt

Modern Aspects of the Diagnosis, Classification and Treatment of Tuberculosis By J Arthur Myers Octavo of 271 pages, illustrated Baltimore, The Williams & Wilkins Company, 1927 Cloth, \$5.50

This book by Dr Myers, who by this time is so well and favorably known to all of us, is a most satisfactory presentation of the more up-to-date methods of diagnosis and treatment of tuberculosis, adult and juvenile.

The only criticism which might be considered at all unenthusiastic, is that too little space is devoted to the roentgenogram as an aid in diagnosis and as a means of actually gauging the progression or retrogression of a pulmonary lesion. It is so universally agreed by this time that the mutation of shadows revealed in serial X-ray plates are of such extraordinary value in appraising the progress of a given case that any slighting or under-statement in this respect is a matter to be somewhat deplored.

The book has many valuable and instructive features, notably that on the modern treatment and prognosis To all students of internal medicine we heartly recommend this book.

FOSTER MURRAY

BOOK REVIEWS

THE METHODS OF CLINICAL DIAGNOSIS BY ALEXANDER GEORGE GIBSON, M.D., and WILLIAM TREGONWELL COLLIER, M.D. 12mo of 398 pages, illustrated. London, Edward Arnold & Co. [N. Y., Longmans, Green & Company], 1927 Cloth, \$7.00

This book is not merely an outline of the methods of clinical diagnosis, but a detailed well classified guide to the fundamentals of diagnosis. The book should be of most invaluable and to the medical student as well as to the practitioner of medicine, in the clinical methods used in arriving at a diagnosis

The authors lay particular stress on the means we have at our disposal in the making of a diagnosis. They describe in detail how to take a history, how to make a complete physical examination, particularly emphasizing

the cardinal methods of inspection, palpation, percussion

and auscultation, of each organ in detail

The routine examination of the various systems are very well treated in complete detail and are well illustrated by charts and diagrams. They include all the systems. Cardiovascular, Respiratory and Mediastinum, Gastro-intestinal, Nervous, Genito-urinary, Hemopoetic, Skeletal, Integumentary, Ductless glands, the eye, ear, nose and throat. There is also a chapter on the Examination of children. Finally, the chapter on Clinical Pathology is sufficiently complete to be of great aid to the

general practitioner

We have not encountered a similar book in the English language to be as complete, nor as well written, and therefore can recommend it very highly

S J COMEN

RADIUM IN GYNECOLOGY BY JOHN G CLARK, MD, and CHARLES C NORRIS, MD With a chapter on Physics by Gioacchhino Failla, EE, M.A., DSc. Octavo of 315 pages, illustrated Philadelphia and London, J B Lippincott Company, 1927 Cloth, \$800

Clark and Norris' book is a more than welcome addition to our gynecological literature. There in one place may be found detailed advice on radium therapy in gyne-A wonderful chapter on the physics of radium written by Gioacchino Failla, physicist to the Memorial Hospital, should be of great value to the gynecologist who has used radium without a clear understanding of the physical and chemical principles involved Filtration is very clearly explained. Nowhere else in English can such a clear exposition of radium physics be found. Preliminary cautery trachelectomy is advocated in carcinoma of the cervix, and the status of radium in the treatment of carcinoma of the fundus is very plainly stated. Fibromyoma is discussed and the generally accepted principles are approved There are other chapters on cancer of the vulva and vagina, cervicitis, dysmenorrhoea, pseudomyxoma peritonei, granuloma inguinale and sterility A very valuable book for the specialist, who is prone to ignore textbooks

THE EXTRA-OCULAR MUSCLES A Clinical Study of Normal and Abnormal Ocular Motility By LUTHER C PETER, A.M., M.D. Octavo of 294 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$400

Dr Peter has become so well known in perimetry and campimetry that many will be pleasantly surprised to see this book. It promises to be quite as important as the book which he first gave the profession. The first part of the book takes up the anatomy and physiology of the eye muscles without dipping deeply into formulas understood by but few and then the phorias are discussed. Next comes squint and the author enrolls with those who attribute the poor vision so constantly found in squint,

to non-use and suppression of the image of the deviating

The final chapter is a discussion of nystagmus which is often omitted from similar works but very properly belongs

This book is sound and conservative and will provide the foundation for anyone wishing to care for muscle errors and which so often is obtained from the top down and not from the bottom up

RIL

PRACTICAL GUIDE TO DISEASES OF THE THROAT, NOSE AND EAR. For Senior Students and Junior Practition ers By WILLIAM LAMB, M D Revised by Frederick W Sydenham, M D Fifth Edition 12mo of 450 pages, illustrated New York, William Wood and Company, 1927 Cloth,\$4 50

This is a practical book that aims to be an exhaustive and comprehensive primer for those who might be in terested in diseases of the ear, nose and throat.

It is to be highly recommended to students and general practitioners Mervin C. Myerson

MAX VON PETTENKOFER HIS Theory of the Etiology of Cholera, Typhoid Fever and other Intestinal Diseases A Review of his Arguments and Evidence. By Edga Ersking Hume, M.D. 12mo of 142 pages with photographs New York, Paul B Hoeber, Inc., 1927 Cloth, \$150

This is a rather disappointing book. Dr Hume gives us an excellent brief biographical sketch of Dr Pettenkofer, showing his genius and versatility, and then shints him aside to elaborate on his theory, which we have since that time, because of further findings, found untenable. It appears to us that a man, admittedly the "Father of Hygiene" and the "Beautifier of Munich," deserves a more elaborate biography and less criticism of his theory, which, though wrong, has undoubtedly stimulated a great deal of work and research in that direction. At least, Dr Pettenkofer was sincere in his belief as shown by his personal observations

Dr Hume elaborately discusses Pettenkofer's theory of the etiology of cholera and, at the same time, totally ignores his excellent researches in chemistry and physiology

WILLIAM RACHLIN

THE PREVENTION OF PREVENTABLE ORTHOPEDIC DEFECTS, WITH SPECIAL REFERENCE TO THE SPINE AND THE FEET BY S C Woldenberg, B Sc., M D Octavo of 120 pages, illustrated St Paul, Minneapolis, Bruce Publishing Company, 1927 Cloth, \$200

Under the above heading, the author discusses Posture, Rickets, Diseases of the Spine, Sacroilaic Joint, Joint tuberculosis, Infantile paralysis and the feet.

The book is excellently written in such a manner as to be of particular value to the man doing general work who obviously has the oportunity to meet these conditions in their early stages, when many of the defects may be prevented or readily corrected

The book does not go into details of technique but confines itself to its subject

The first chapter is a very interesting historical survey of the high lights of the development of Orthopedic Surgery

gery
The final chapter is a very able discussion of prescribed exercises as preventive treatment, and conservative treatment of beginning deformities

The entire work is illustrated with numerous and well selected pictures K. T. Young

Graduate Fortnight of The New York Academy of Medicine

OCTOBER 1st to 14th, 1928

No

Preliminary Announcement of Program

THE Problem of Aging and of Old Age will be the topic of the first Fortnight and will be discussed from many angles. Particular consideration will be given to the early recognition and prevention of disturbances which are often the underlying causes of aging. The program will include morning, afternoon and evening sessions each day

Sessions in Teaching Hospitals

Special courses and clinical lectures and demonstrations have been arranged in more than forty of the teaching hospitals of the city (9 to 12 am and 2 to 4 pm) For the purposes of the Fortnight the hospitals of the city have been divided into three groups. The hospitals of each group will present programs similar in character and scope so that it will be possible for the physician to spend a full day in the hospitals of one section of the city and thus avoid the necessity of making long trips between hospitals

Among the subjects which will be presented in the hospital programs are

Allergy
Arthritis and Orthopedics
Blood Chemistry
Bronchoscopy
Cardiology
Dermatology and Syphilology
Diabetes
Functional Diagnosis
Gastro-Enterology
Gynecology
Hypertension and Neph

Neoplasms Cancer
Neurology
Ophthalmology
Otolaryngology
Pathology
Physical Therapy
Pneumonia and Infectious
Diseases
Proctology
Radiology
Surgery
Traumatic Surgery
Urology

Sessions at the Academy of Medicine

During the Fortnight there will be two sessions daily at the Academy, one in the late af-

ternoon (5 to 7 pm), the other in the evening (8 30 to 10 30 pm) Supper will be served at the Academy for those desiring it

The list of American and foreign speakers includes

Harlow Brooks Lawrason Brown Samuel A Brown Thomas R. Brown Leo Buerger Sir Farquhar Buzzard Alexis Carel Russell L Cecil Arthur F Chace Alfred E Cohn Charles F Collins Louis I Dublin William Engelbach James Ewing Nellis B Foster Howard Fox Menas Gregory Pierre Janet Foster Kennedy Alexander Lambert Samuel W Lambert Emanuel Libman

Williams William H. Wilmer Francis Carter Wood John Wyckoff Edwin G Zabriskie

Among the subjects which will be discussed by the speakers are

Postponement of the individual processes of age Clinical aspects and management of old age Arteriosclerosis and aneurism Endocrines in relation to age Traumatic surgery Bronchitis and asthma Physical therapy and climatology

Hypertension
The psychoses
The myocardium
Angina pectoris
Arthritis
Gastro-enterological
problems
Aging of the human brain
Diet and body weight
Apoplexy

No fees will be charged for attendance at any of the clinics or meetings on the program

OUR NEIGHBORS

DR JACQUES GARDETTE

The Rhode Island Medical Journal of June contains the following account of the work of Dr Jacques Gardette, as described by Dr W S Sherman of the Newport Medical So-

ciety

"The latter part of the eighteenth century has been termed the golden age of medicine in Newport Dr Benjamin Waterhouse alluding to this period says-We doubt whether Boston, New York or Philadelphia ever had, at one and the same time, two practitioners of physics and surgery, better educated and more skillful than these two gentlemen'-referring to Dr Hunter and Dr Halliburton

"Another who left the impress of his skill and conscientious investigation upon many pupils and followers is Dr Jacques Gardette, a contemporary of Lafayette, who was commissioned as a surgeon in the French navy ardent patriot, of excellent education and charming manners, he arrived at Plymouth, early in January, 1778 for the sole object of fighting for the 'Holy Cause'

"After resigning from the French navy we find him in the little Army of the North, commanded by Lafayette, where he practiced general surgery and dental surgery, having studied the latter as a part of his profession of naval surgeon When the French fleet and army arrived at Newport in 1780 he was induced to engage in practice in this town where he was well received and found considerable and congenial occupation

"We hear of him again in Providence in 1781-82, where the army was in winter quar ters, and where besides his surgical service, he employed his knowledge of dental surgery in treating the officers and men. At that time he made the acquaintance of a young American surgeon, Josiah Flagg, also serving in the army, whom he initiated into the principles of dental surgery, in which Flagg took a lively interest

"We find Gardette in New York in 1783, where his limited knowledge of English proved a handicap to his success and it was not until the summer of 1784 and in Philadelphia that he attained the position which determined his permanent residence in the United States"

MEDICAL EDUCATION OF THE PUBLIC

How can physicians educate the people medically? Certain it is that doctors are misunderstood, and no wonder,-for the people have not the background of knowledge to understand what the doctor tells them a physician speak ever so simply and clearly, the people generally will grasp only one or two points Even doctors after years of study and training, must devote considerable time and effort to understand a new principle in science. How much less then can the average layman understand a doctor's explanation of disease?

What the people actually grasp is set forth in the following editorial from the Medical Journal and Record of June 6

"Medical knowledge is being so assiduously popularized through the syndicated columns of the daily press and the innumerable inexpensive booklets on health, to say nothing of the advertisements in newspapers and maga-

zines, that every layman knows something, and many think they know a great deal, about the vagaries of the human organism would happen to anyone who retained all the information and followed all the advice so solemnly set forth is a momentous question, but luckily it is of ony academic interest. The enthusiastic student would be so involved in contradictory directions, that by the end of a week it would take twenty-four hours a day merely to arrange a schedule that would give adequate time for the proper exercises, raisin and orange eating, masticating, sleeping, hair brushing and the thousand and one other occupations reputedly essential to a long and healthy life

"But it is not only from the press that the public derives its wealth of erroneous ideas about matters medical, surgical and the like The layman, coming to the physician for treat-

(Continued on page 891, adv xni)

(Continued from page 888)

ment, listens to his words of wisdom and interprets them in accordance with his own intellectual and experimental background, arriving at conclusions far removed from the original intention of the physician. It is not the layman's fault, neither is it necessarily due to his stupidity. It is simply that the words mean little or nothing to him, and to help himself toward a satisfactory understanding, he elaborates and interprets with the aid of his preconceived ideas and his traditional notions of medicine.

"Every sick person wants to know the diagnosis, so do his relatives and friends, and even his enemies Why it is so desirable to know the name of a disease, why a polysyllabic word with a Latin termination is such a source of comfort and encouragement, is an interesting matter to speculate about. Whatever the reason, the average person feels cheated if he has to get well without having a sonorous and tongue twisting label attached to his ailment There is no harm in gratifying this phase of human curiosity, provided the patient is not the type that instantly crawls out of bed and pulls down the encyclopedia to gather all possible information on the subject of prognosis, complications and sequelæ

"The physician is in a serious dilemma he refuses diagnoses and explanations, he is sure to be considered an ignoramus who does not even know what is the matter with his patients, much less how they got that way If he speaks, what extraordinary pronouncements are credited to him! Sometimes he can compromise by uttering a series of indefinite remarks which by their vagueness are not only safe but soothing Many are the nephritics, the cardiacs, even the paralytics who have, according to their relatives (quoting the physi cian), died of 'complications' Safe enough, they probably did Satisfactory, too, it sounds as if it meant something very definite and profound

"To the physician who believes in educating the public falls the serious and important task of giving out information in a way that cannot be misunderstood. If one feels in duty bound to tell a mother why her daughter has developed dementia precox (fortunate indeed is the physician who knows) let it be in words of one syllable with frequent pauses and repetitions that the process of comprehension may be complete and absolute. Even then on some sad day the admitting officer of the psychiatric hospital will hear "The doctor said she lost her mind because her ministration went to her head"."

The Battle Creek Super Solar Arc Lamp

For Heat, Light and Ultra-violet Therapy

THE new Battle Creek Super Solar Arc Lamp is unique in the field of Phototherapy appliances. It is the result of our own 40 years experience as pioneers in the production of therapeutic arc lamps in this country

Many advanced features of construction make the new Battle Creek Super Solar Arc Lamp noteworthy A snap of the switch starts the arc burning at full power No time is lost in waiting for the rays to attain adequate intensity The lamp being automatically adjusted by magnetic feed, the largest arc possible with the given current is always maintained.

A specially constructed adapter is furnished with the lamp It is designed so that the arc does not heat the applicators Any standard quartz applicator may be attached

By giving off rays in both the infra red and ultra violet the Super Solar Arc may be used to successfully treat a wide range of diseases. The technic of handling it is easily mastered Various spectra are instantly obtainable by the use of different carbons.

We have recently prepared a new bulletin which describes fully the many advantages of the new Super Solar Arc Lamp May we send you a copy?

Sanitarium & Hospital Equipment Co. Battle Creek Michigan

Battle Creek Therapeutic Appliances Include:

Hydrotherapy Apparatus— Type G 3

The Battle Creek Hydrotherapy Apparatus is constructed through out of high quality brass. The appliance has wall type control and gives jet rain or shower penneal needle spray and Scotch douches.

Electric Light Bath Cabinets

Three models varying in size and cost. Each cabinet complete with special comfort chair and necessary bulbs Made of the finest hard wood water proof cemented veneer

The Battle Creek Radiant Baker

A tested appliance for heat application. The Baker is constructed of aluminum and asbestos and equipped with safety rheostar to prevent excessive heating

The Battle Creek Treatment Photophore

A most efficient appliance for making local applications of heat It combines the essentials of many expensive therapeutic lamps in one simple effective appliance

as we made our rounds with our preceptor, who showed many cases which looked quite different from the picture presented in the lecture room. Thus perhaps one or two years passed, when it finally came to the last course, which was nearly the same as the first. The same old manuscript lectures came out which, perhaps, were the same as used for many years. There was the thesis and the reviews and the examinations and the graduation. Some students had the advantage of a third course, but the third course was practically the same as the first two."

THE MAINE PUBLIC HEALTH ASSO-CIATION

The June issue of the Journal of the Maine Medical Association is devoted almost wholly to the Maine Public Health Association, in which the State Medical Society is interested. The report of the Supervisor of the Child Health Education Service, Abbie M. Buck, describes three activities of the service, as follows.

"The health habit program which is most universally used in the elementary schools is the Modern Health Crusade. The Modern Health Crusade is the health project included in the physical education course outlined by the State Department of Education. The pupil or class performing simple daily health chores is thus

enabled to do better school work
"The Modern Health Crusade is used in every county in the State of Maine, in every state of the United States, and in eight or ten foreign countries. During the past four years, Maine has stood high in this health habit program Pennants are awarded to schools in which 100% of the pupils perform a certain number of health chores, covering a period of twelve weeks. These pennants are awarded all over the United States by the National Tuberculosis Association, under which the Maine Public Health Association functions and with which it is affiliated.

"For the past four years, Maine has stood second in the United States in proportion to her population in the number of national pennants won The State of Iowa has held first place for several years

"In May, 1926, a 'Clean Mouth' campaign was maugurated in the schools of Maine Letters were written urging the pupils to make an effort to have the necessary dental corrections made as early as financial conditions would permit Suggestions were made as to how the child might obtain the money to pay for dental corrections

"Two certificates were offered at this time One to schools in which 50% or more of the children had all the necessary dental corrections, and 100% certificates to schools in which all of

THE MEDICAL PRECEPTOR

The Journal of the Iowa State Medical Society for June contains an editorial on the preceptorial system of medical education, presumably from the pen of Dr D S Fairchild, of Clinton, who started his medical studies when the preceptorial system was at its fullest development. The writer says

"The general plan was for the young man to select the practitioner with whom he desired to study and arrange the terms Sometimes it was arranged for the young man to enter the family of his preceptor or to become an office student and secure board near his preceptor, or to live at home, if near by, coming to his preceptor's office to recite at stated periods As soon as terms were arranged, the preceptor assigned a number of textbook pages and thus the process of medical education began The close relation of the student and his preceptor made it convenient and possible for the student to assist his preceptor in emergency cases or to go with him on his rounds of practice and in suitable cases to make personal examina-In those days the doctor carried his medicine and the student could sit by and see the medicine dealt out. After the doctor and his student left the patient, the nature of the case, the nature of the medicine and the examinations were talked over Sometimes several patients were visited in one day and made a very good clinic

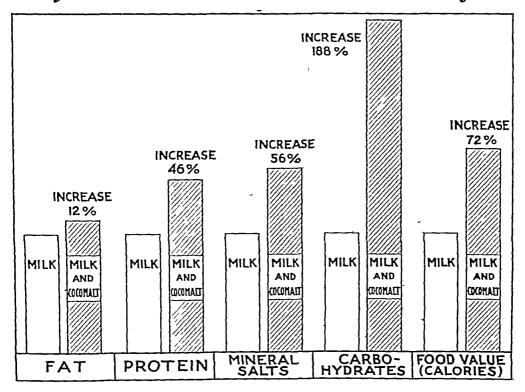

"The personal attitude of the preceptor toward his patient gave the student a good understanding of the elements of success with popular doctors

"The personal contact with a refined and cultured family was of great social advantage to the student and helpful in his future relations to his patients

"After the student had studied in his preceptor's office about one year, the question of a course of medical lectures came up for consideration. In the medical school there was but little time for reading and text-book Three hours of lectures in the morning, and three hours in the afternoon were no laboratories, no microscopes, no scientific apparatus, except a few weeks in the dissecting room, in the evening At the end of sixteen weeks (at Ann Arbor twenty-four weeks), we returned to our preceptor's office with an accumulated fund of rather questionable stories and a beginning beard turned probably with an increased assurance in our knowledge of medicine This was due. in part to the dogmatic attitude of the pro-We had no doubt but what was heard was absolutely true, but which gradually faded

Why Cocomalt makes Milk a better food

PEDIATRICIANS have found the above table of great interest. It shows just what Cocomalt adds to milk how it increases vital food elements

When mixed with milk according to directions, Cocomalt increases the fat content of milk only 12%, the protein 46%, the mineral salts 56% and carbohydrates 188%. It increases the number of calories 72%

And Cocomalt's creamy chocolate flavor makes milk so palatable that children and adults take it readily. Thus one of the most difficult phases of dietetic work is happily solved

Patients drink it eagerly In difficult nutrition cases, particularly under post-operative conditions, in maternity cases and wherever delicious, easily

assimilable nourishment is needed, Cocomalt is being prescribed with good results

Cocomalt is sold by grocers throughout the country at 45c per pound can (50c west of Mississippi), this reasonable price permitting

daily use by patients of all classes

Physicians are invited to send for half-pound can which will be sent gratis for actual testing

the pupils had the necessary dental correction It is often difficult for parents to get their children to go to the dentist. The contest idea appeals to the child. He goes to the dentist because it is the fashionable thing to do—all the children are having their teeth attended to

"The new feature of my work this year has been the 'Six-Point' child program. While this work has been handled by our nursing services through our county and local nurses in their respective territories, I am able to carry the message to the sections of the State that do not have the services of the nurse.

"What is the 'Six-Point' child? A 'Six-Point' child is one who measures up to the minimum standards as indicated by a physical inspection of six points

"Why have a 'Six-Point' standard for children? An analysis of physical inspection of school children shows that most defects are listed under the headings of malnutrition, defective vision, impaired hearing, abnormal throat conditions, nasal obstruction and defective teeth These defects, if not corrected, seriously hamper the child's progress in school and may produce a harmful lasting effect on health later in adult life. If we correct these defects in childhood, we are safeguarding the health of future citizens and the prosperity and well-being of our nation. The child in good health is a better pupil. The man or woman in good health is a better citizen.

"How can we interest the pupil in becoming a 'Six-Point' child? To encourage our pupils to strive to become 'Six-Point' children, the Section of Public Health Nursing and Child Health Education of the Maine Public Health Association will furnish 'Six-Point' buttons which may be awarded May 1st, National Child Health Day, to all children who were 'Six-Point' children through the school year, also to all children who have had defects corrected during the year, thus placing themselves in the group of 'Six-Point' children"

CARE OF FEEBLE-MINDED CHILDREN IN WEST VIRGINIA

The House of Delegates of the West Virginia State Medical Association, on May 21, passed a resolution urging the Legislature to make a liberal appropriation for the care of feebleminded children. The arguments for the resolution were summarized by Dr. T. L. Harris as follows in the July West Virginia Medical Journal

"In brief the facts are Two percent of the children of the State of West Virginia are feebleminded, or thirty thousand of our population. These are concentrated in rural sections. In-

GENERAL USEFULNESS

of

MERCUROCHROME 220 SOLUBLE

(Dibrom-oxymercuri-fluorescein)

A great many doctors use Mercurochrome for some purpose or other in their practice, but few doctors use it for all the purposes for which it can be employed with great effectiveness. If you are using Mercurochrome in the eye, try it in the ear, nose and throat, if for urethritis in the male, try it for cervicitis in the female, if in accidental wounds try it in surgical wounds, if for the preparation of obstetrical cases, try the special alcohol, acetone, aqueous solution for preoperative skin sterilization, if in erysipelas, try it in eczematoid ringworm. There is hardly an infection or infected condition in which a thorough trial of the value of Mercurochrome is not worth while

Mercurochrome is so slightly irritating that dilutions with high germicidal potency can be used even on the most delicate mucous membranes. With many germicides it is necessary to dilute the solutions to a point where bactericidal efficiency is sacrificed to avoid irritation or damage to tissues. With Mercurochrome it is never necessary to dilute beyond germicidally potent concentrations to avoid irritating effects. Solutions from ½ to 1 per cent to 20 per cent are employed for different clinical applications.

sanity is in the cities These feeble-minded peo ple require some kind of treatment and should be in institutions The point in the minds of the social workers is that we are at the stage of development where we need appropriations for crippled children and especially an institution for feeble-minded It would be the center around which the counties could be affiliated and directed by the State institution Dr L V Guthrie, of Huntington, has been interested in this work for a number of years Forty-five percent of the inmates of our State penitentiary are feeble-Two or three percent are mentally de-There are three or four hundred feebleminded children in Huntington at the State hospital at the present time. There is no special institution to which Judge Owen can permit We have three thousand feeblethem to go minded children becoming criminals who should It is time our be cared for in an institution Legislature in West Virginia joined the other states and appropriated possibly \$100,000 to make a beginning on this work

"Inasmuch as there is no profession in this State more public spirited than the medical profession, Judge Owen thought this should be brought to your attention. It will help a great deal in getting something definite done are only four states that do not have some kind of provision for feeble-minded, and West Virginia is one of them. In the coming session of the Legislature we should present this matter in such a way that it will convince them that

we need such an institution"

A COMPROMISE FEE

The May issue of the Journal of the Indiana State Medical Association contains the following story in which names and dates are omitted

"A woman badly burned in a factory was treated for more than a year by a surgeon who during that time performed one or two skin grafting operations and gave other exacting attention The woman compromised with the factory on a payment of twelve thousand dollars, and her attorney, who did not go into court but effected the settlement for her, presented her with a bill for two thousand dollars The surgeon in the case. hearing of the attorney's charges, also put in a bill for two thousand dollars The attorney promptly advised the physician that the bill would not be paid as it was excessive and that his client was a poor woman who needed all that she could get from her settlement with the company for 'All right' said whom she previously worked the surgeon 'vou cut your fee in two and I will do likewise'. To this the attorney objected but as the surgeon was obdurate the attorney finally consented, which reminds us of the old saying that 'It makes a difference as to whose ox is bemg gored'"

APPLYING SCIENTIFIC DISCOVERIES

The suggestion of an English clergyman that science should take a ten-year vacation in order that people might catch up with its discoveries, has aroused protests from all sources Science unused is soon forgotten, and its facts have to be discovered over again Commenting editorially on this fact, the June issue of the Wisconsin Medical Journal gives the following illustration of what happens when science takes a vacation

"In this connection and with direct application to the medical sciences, it is interesting to observe that nearly 200 years ago an American physician, John Lining, laid the unused foundations for the modern metabolism studies and tests which are today engaging much attention from the clientele as well as from the internists themselves. And those experiments of John Lining were done with an exactness of technique and 'scientific mindedness' that cannot be surpassed in a modern richly endowed research laboratory. He lacked instruments of precision such as characterize modern laboratories, but this did not daunt him. He improvised what he required

"As American physicians we can glory in the possession of such a pioneer physician and research student. We cannot plume ourselves, however, on any capacity, hitherto, to appreciate him and his work. His contributions and his very existence had to be rediscovered."

PHYSICIANS IN PUBLIC

The June issue of the Rhode Island Medical Journal has the following brief editorial on Physicians in Public

"From time to time matters that are of interest to the public and the physicians are discussed and studied by groups of the laity, who more or less represent and mold public opinion. Frequently these matters are of great importance to public health and can better be sponsored by an impartial public spirited organization than by a body of medical men

'However, the lack of technical information in a group of non-medical men may render ineffectual efforts in a good cause and may even do definite harm. Further, medical men in such bodies may even initiate interest in well-deserving medical causes that would otherwise be disregarded.

"Well organized bodies such as Chamber of Commerce, Kiwanis and Rotarians afford good opportunity for the physician to perform public spirited service without injecting himself into the public eye or running the risk of criticism"

THE WISCONSIN STATE MEDICAL SOCIETY

The President of the Wisconsin State Medical Society discusses the activities of the Society on the President's Page of the May issue of the Wisconsin Medical Journal as follows

Five years ago our small county societies, with limited means, had a hard time to secure adequate or frequent programs While it is highly desirable that the county society develop program material from within, we all recognize that it is valuable to have new ideas and new thoughts presented to us from the outside But the county society that must pay a minimum of \$25 to cover the expenses of a speaker finds itself indeed handicapped unless it is most advantageously located or has a large membership So it is that the splendid reorganization of the medical extension work on the absolutely free basis to the county medical society has brought to our membership an abundance of program material without a penny of expense This great advance is reflected in the increased activities of our fifty component societies and I prophesy that within another year there will be no component organization in the state that may be called in any sense of the word a paper organization

Outside of the two larger medical centers of Wisconsin with their closed hbraries of five years ago, the member in the state had indeed a hard time to secure any adequate library service. What a change has come about not only are the libraries open but we have seen the mauguration of a package library service through the extension division which brings to us overnight recent journals. packets on a given subject, bibliographies, books, and related material The member who has a difficult case may refresh his memory and he who desires to write has every facility placed at his convenience

Poland Water

is not merely a pure table or bottled water, but it is a valuable adjuvant in the treatment of many forms of kidney trouble on account of its bland diuretic properties

680 Fifth Avenue New York

This single advance, inspired by the state society, has met with such tremendous response from the membership as to indicate its great expansion for the future

The reorganized medical extension service will shortly announce the inauguration of home post-graduate clinic courses and has already made plans for courses at our state university

This discussion may not be concluded without calling your attention to the advance in our own journal during the past five years. The policy of excluding papers from without the state except such as may be read at state meetings has gone a long ways towards furthering the advance of Wisconsin medicine. There is much that remains to be done, but our progress has been notable.

Next month I shall conclude this topic with a discussion of our material advances Then we may each answer the question, Is it worth while?

BIOLOGY AND ALCOHOL

An editorial in the July issue of *The Nebraska State Journal* calls attention to a possible explanation of the physiological value of alcoholic liquors and says

"All the myriad varieties of fermented liquors are produced by the growth of yeast. Yeast is one of the most important sources of Vitamin B, and Vitamin B is soluble in alcohol and is well preserved in alcoholic solution."

"Man first existed in the warm regions where he could get his food from hand to mouth every day. When he moved on into countries where food storage was necessary, he had also to preserve the vitamines. The fermentation of liquors seem to have been one way of carrying a supply of Vitamin B through the winter."

HORLICK'S MILK MODIFIER

Horlick's Milk Modifier, a new product made by the Horlick's Malted Milk Corporation, Racine, Wisconsin, is now being introduced to the medical profession. This maltose and dextrin product which is derived exclusively from malted grains, was first announced at the annual meeting of the American Medical Association in Washington, D. C., in June, and created much interest. Since that time it has been presented to convention gatherings in other parts of the country

In conformity with the Horlick policy, the Milk Modifier is put up in hermelically sealed glass jars only. The one pounds size retails at \$75 and the five pound jar at \$300. The fact that it carries the name "Horlick's" is a guarantee that only the finest materials are used—Ady

In Summer Diarrhea—

TREATMENT of this common infant's complaint requires a corrective standard diet. Merrell-Soule Powdered Protein Milk constitutes such a diet long accepted by the medical profession

Merrell-Soule Powdered Protein Milk owes its sustained pediatric recognition and approval to

DEPENDABILITY-Made to a standard of uniformity which has never varied

KEEPING QUALITIES—The container and manner of packing of all Merrell-Soule milk products insure perfect preservation for an indefinite period

RESULTS—One experience usually results in continued and increased use by the Doctor

PARAPSORIASIS*

Suggestions for Simplifying Its Nomenclature and Classifying Its Clinical Varieties for Teaching Purposes

By FRED WISE, MD, NEW YORK, N Y

THE urgent need for modification and revision of nomenclature is felt by all who have experience in teaching dermatology to under- and post-graduate students Such revision and modification need be neither drastic nor revolutionary I am one of those who believe it to be much better to retain old and familiar names Names like lupus, sycosis and alopecia, derived from wolf, fig and fox, should not be relinquished despite their bizarre origin, for they, and what they represent, are established firmly in the mind of the student and are visualized with relation to the diseases named Changing old, established and familiar names is apt to give rise to more confusion in the mind of the student than already exists

Hence I believe in retaining the name parapsoriasis for the group of clinical entities which it represents. Experience in the past ten years has taught me that while many students seem to be more or less familiar with the different and varied names bestowed upon the different types of parapsoriasis eruptions, their conception as to which name applies to which eruption is extremely vague. As a matter of fact this uncertainty has been shared by me on more than one occasion in the classroom

Formerly regarded as one of the rare dermatoses, parapsoriasis with its diverse clinical manifestations is today a disease of relatively frequent occurrence. This is unquestionably due to the fact that it is more often recognized by the specialist. In the years 1921-1924, one hundred and sixty-five cases were reported in Europe and forty-four in America. No doubt there are many people with parapsoriasis who never consulted a specialist.

The vagaries of nomenclature and classification are briefly illustrated in the following chronological outline

1890 Parakeratosis Variegata Unna, Santi and Pollitzer

*Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls, N Y, May 11 1927

1894 Dermatitis Psoriaisformis Nodularis Neisser

1894 Psoriasiform and Lichenoid Evanthem Jadassohn

1897 Pityriasis Lichenoides Chronica Juliusberg

1897 Erythrodermie Pityriasique en Plaques Disséminees Brocq

1900 Lichen Variegatus Crocker

1900 Brocq's Disease Arndt

1901 Chronic Resistant Macular and Maculo-Papular Scaling Erythrodermias Colcott Fox and MacLeod

1902 Scaling Erythrodermias Appearing in Disseminated Spots Torok

1902 Parapsoriasis en gouttes Parapsoriasis lichenoïde Parapsoriasis en plaques

1905 Xantho-Erythrodermia Perstans Crocker and White, and Pernet

1906 Pityriasis Maculosa Chronica Rusch 1907 Erythrodermia Maculosa Perstans (or

Chronica) Riecke 1924 Erythrodermie Polymorphe Pérsistante

1924 Erythrodermie Polymorphe Pérsistante Gastou

Many other designations have been suggested Dermatitis variegata (Boeck), Dermatosi squamosi anormale (Casoli), Rona named the disease Morbus Jadassohni Bucek suggested the following classification (1903),

a Parapsoriasis nodularis

b Parapsoriasis maculosa c Parapsoriasis mixta

The majority of American writers favor the following classification, a modification of the one suggested originally by Brocq

a Guttate Variety
Parapsoriasis en gouttes (Brocq)
Dermatitis psoriasiformis nodularis (Jadassolin)

Pityriasis lichenoides chronica (Juliusberg)

b Retiform Variety
Parapsoriasis lichenoïde (Brocq)

Parakeratosis variegata (Unna, Santi and Pollitzer)

Lichen variegatus (Crocker) c Plaque Variety

Parapsoriasis en plaques (Brocq)

Erythrodermic pityriasique en plaques disséminces (Biocq)

Xantho-erythroderma perstans (Crocker, J. C. White)

It will be readily appreciated that to the average student this is a bewildering mélange

In recent years, two additional clinical types of parapsoriasis have been recorded by several eminent dermatologists

a Parapsoriasis Atrophicans (Kreibich)

b Pityriasis Lichenoides et Varioliformis Acuta (Habermann)

Finally, several cases have been reported in which the patient exhibited Brocq's three varieties of eruption at the same time (Muschter)

It has often been suggested that Brocq's Erythrodérmie pityriasique en plaques dissemmees be thrown out of the group and regarded as a separate entity I certainly am not in accord with this point of view. The fact that the disseminated macular lesions—large pink, yellow, brown or purplish-violaceous patches -are sometimes seen together with the other varieties of the eruption in the same patient, is to me a weighty argument against such a conception. I have examined histological sections from lesions which were guttate, nodular and macular and could barely distinguish them The microscopic picture from one another varies chiefly with respect to the degree to which morbid changes have advanced are variations in the degree of hyperkeratosis and parakeratosis, in the amount of cedema and disintegration of the epidermal cells, in the degree of papillary œdema, in the density of infiltrating cells, in the extent of the vascular dilatation, and so forth But on the whole, there is a remarkable and striking similarity in the microscopic sections taken from lesions which to the naked eye appear to be totally dissımılar

Therefore, for teaching purposes, I believe it to be the wisest course to group all these different clinical pictures under one head and name them collectively, parapsoriasis If some such course be not adopted, the teacher of dermatology will lay himself open to the student's accusation that he is "inconsistent, inconsequential and contradictory" Furthermore, Brocq's name should be retained in recognition of his work in this field, and, finally, I believe that the student is enabled to obtain a better conception of the history, development and nosology of skin diseases as a whole, if he is taught to associate the name of an eminent worker or investigator with the disease or group of diseases which he is studying

The English-reading student of dermatology has become familiar with Brocq's well-known

three clinical varieties, at least as far as concerns their names Students who do not read German, or who lack access to German dermatological publications, will be interested in the following brief accounts of (1) Parapsoriasis Atrophicans, and (2) Pityriasis Lichenoides et Varioliformis Acuta

PARAPSORIASIS ATROPHICANS

Kreibich described the eruption in a woman aged 27, in whom the disease had been present

for a year

sparse

The elementary lesion was a pin-head sized, opaque-white vesicle, similar to those seen in rare cases of psoriasis in children. The little vesicle did not become yellow, despite the fact that its contents consisted of neutrophile leucocytes. The lesions were surrounded by a zone of hyperaemia of yellowish-red hue Formation of fresh vesicles caused a spreading of the hyperaemia. Drying of the vesicle resulted in a thin crust of yellow color, the original white color evidently being due to the unaltered roof of the vesicle.

Anatomically, the seat of the vesicle was immediately beneath the horny layer, it was densely packed with leucocytes. The base of the vesicle was formed by the uppermost layer of the rete cells, among which were scattered leucocytes. A new layer of horny cells would soon grow over the base of the vesicle, springing from its edges, resulting in an accumulation of leucocytes in the horny layer, which, being thrown off, was followed by a certain amount of parakeratosis. Compared to the density of leucocytes in the vesicle, the leucocytic infiltration in the cutis was remarkably

The appearance of fresh lesions was fre-Following a warm bath, quently oserved broad zones of hyperaemia appeared about the older lesions, and persisted. The following day, these hyperaemic areas presented numerous white vesicles, so that the eruption spread widely within the areas of hyperaemia, resulting in a subsequent parakeratosis to ultraviolet rays caused a confluence of the groups of vesicles, so that the horny layer was thrown off by the accumulation of a leucocytic This was followed by parakeratosis, which persisted for a variable time, vanishing together with the hyperaemia, after which the skin returned to normal, until a new crop of vesicles would make its appearance

This process was observed chiefly on the skin of the breasts and back. On the arms, a severe eruption of vesicles resulted in a cyanotic discoloration of the skin, chiefly the extensor surfaces. Large, diffuse areas of vesicles and a cyanotic change in the skin appeared on the lower trunk and the buttocks, here the skin changed to a dusky-red hue, like that seen in

idiopathic atrophy of the skin In fact, a mild degree of atrophy could now be discerned in the affected areas This was most pro-

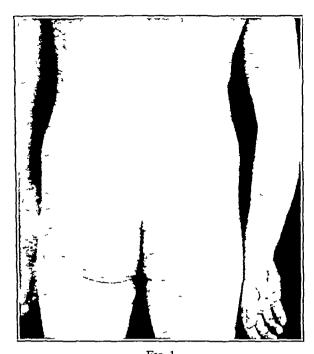

Fig 1 Parapsoriasis Guttata McCaskey's Patient Showing distribution of lesions

nounced on the left leg, despite the presence there of parakeratosis and many pustules circumscribed patch on the right leg, surrounding its lower portion, presented the highest degree of atrophy, part of it being cyanotic and covered with pustules, the upper portion presented only a few pustules, the cyanosis was absent, and the skin became white, atrophic with the consistency of thin paper, with "cigar-

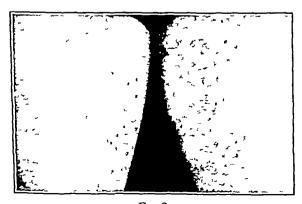

Fig 2 Parapsoriasis Guttata McCashey's Patient Showing nodular lesions capped by adherent scales

ette paper" wrinkling, so that the subcutaneous veins shone through like blue strands

On the buttocks, where the cyanosis was most pronounced, the cutis presented advanced Here and there were destructive changes seen subcorneal collections of leucocytic masses, a high grade of acanthosis, and a marked prolongation of the rete pegs Examination of a pustular and scaly lesion revealed advanced alterations in the cutis There was considerable thickening of the vascular walls, due more to connective tissue thickening than to an increase in the cellular structure, the vascular distribution was abnormal, the vascular branches running horizontally and vertically, blood vessels predominated in the cutis media, in the pars sub-papillaris the vessels were abnormally thickened, the musculi arrectores abnormally developed. The cutis media

Parapsoriasis Guttata

McCaskey's Patient Showing near view of area on inner aspect of thigh, papiles and nodules with adherent scales simulating psoriasis guttata

was traversed by numerous fibroblasts running horizontally, many young connective tissue cells were seen in the papillary bodies trates of round cells and plasma cells were sparse

The picture was that of a chronic destructive inflammatory process, combined with acanthosis, parakeratosis and scattered pustule formation

Kreibich had previously described a similar case

in a man aged 30 Analogous instances have been recorded by Wismewski, Siemens, Rille, Werther and Pautrier

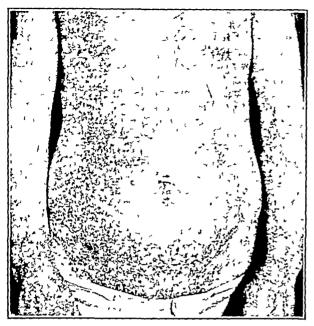

Fig 4
Parapsoriasis Papulata
Showing papular and nodular lesions resembling those
of lichen planus

PITYRIASIS LICHENOIDES ET VARIOLIFORMIS ACUTA

Habermann described two cases Previous to his publications, analogous cases were described by Mucha, Rusch, Sachs and Oppenheim

The eruption had Case 1—A boy aged 18 spread over the body within a period of ten days, without subjective symptoms The eruption was located on the trunk and extremities, but did not implicate the skin of the head, face, hands, feet, anterior aspect of the lower halves of the legs, it was sparse on the forearms, more pronounced The lesions consisted of lentil to on the trunk dime-sized, partly elevated, moderately infiltrated spots, some of which were slightly scaly, the color varied from pale-red to livid and brownish tints, some of the lesions were covered by ad-They were for the most herent brown crusts part oval in shape and arranged parallel to the lines of cleavage of the skin The mucosae and genitalia were unaffected There was a generalized adenitis, the glands being pea-size, and slightly indurated Dark-field examination for spirochaetes and the Wassermann reaction were negative

The pirquet test was faintly positive The blood count showed an eosinophilia of seven per cent, and was otherwise normal

Course - The patient received an injection of

neosalvarsan 0.45, causing a temporary aggravation of the lesions which became more inflamed. There was no subsequent retrogression. In the next few days a fresh crop of non-scaly papules appeared, while some of the older lesions assumed a bluish-red tint and I ecame crusted. Soon after, the eruption disappeared, and within a month the affected areas presented slightly depressed, darkly pigmented spots at the sites of the pre-existing eruption.

Case 2—A man aged 21 The eruption was of three days' duration There were no sub

jective symptoms

The eruption consisted of fairly numerous lesions on the trunk, arms and thighs, evenly distributed Some were slightly elevated and not resistant to the touch they consisted of macules and papules from barley to large pea-size The older lesions were brownish in color and slightly scaly, the more recent ones were lighter and had smooth surfaces Numerous nodules were capped by a blackish crust, others showed a cyanotic tint with an inflammatory halo There were many lesions in transitional stages of evolution glands in the axillae and groins were enlarged Removal of a crust revealed a sharply defined spot with a serous exudate On the mucous surface of the upper lip was a pea-sized, sharply defined superficial ulcer, the surface yellow, the edges

Parapsoriasis Papulata Showing infiltrated papules and nodules of lichenoid appearance

clear cut Wassermann reactions and spirochaete examination were negative. Von Pirquet test was faintly positive. The blood was normal

Course—Some of the lesions, at first reddish papules, progressed to form bluish-red, crusted formations—Then resolution of the entire exanthem took place, leaving small, flat, reddish scars,

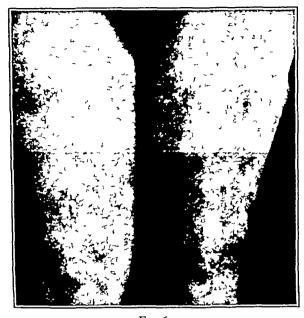

Fig 6

Parapsoriasis Maculata

Showing disseminated macular lesions, of various shades of color, with faint scaling and delicate wrinkling of the surface of some spots

with strongly pigmented margins. The lesion of the lip also healed, leaving a shallow depression

Histology -A relatively fresh papule was examined microscopically The corneous layer was thickened and contained many well-stained nuclei, isolated and clumped round cells were scattered throughout this stratum. In its mid-portion, the lamellae were pushed apart by dark-stained, friable masses The rete layer exhibited pronounced alterations, its structure, finctorial reaction and cellular arrangement were so distorted that identification of individual rows of cells was not possible The nuclei were irregularly shaped and stained, the cells themselves completely distorted, the protoplasm partly hydropic and partly disintegrated, with scattered lacunae The most pronounced destruction appeared in the basal cell layer, here the pressure of the loosely clumped infiltrating cells gave rise to a complete breaking up of the basal cell layer at irregular intervals. In some areas the rete was composed of three or four layers of distorted epidermal cells In the papillary and subpapillary layers the capillaries were distended, the strands of elastic tissue were crowded apart by a loosely-clumped cedematous infiltrate of cell masses, the cells themselves being round and spindle-shaped There were a few plasma cells and polynuclear leucocytes In the deeper portion of the cutis the morbid changes were much less pronounced, the infiltrating cells accompanying the vessels and follicular ducts

These histological alterations correspond to those found in similar eruptions by Mucha, Rusch and Oppenheim The last named author proposed the name "Pityriasis lichenoides with varicellalike onset"

On the strength of the clinical and microscopic findings, these authors classified this type of relatively acute eruption under the head of the parapsoriasis group of exanthems

Strongly supporting this view is the recent publication of Almkvist who describes a case under his observation from Righl's clinic and reviews the previously reported ten examples of the disease The histological findings in his patient, viewed as a whole, point directly toward a parapsoriatic process with unusually intensified inflammatory changes in the connective tissue Syphilis, tuberculosis and leukemia are eliminated by the micro-The microscopic findings in Almkvist's case were the same as those reported in the cases of Mucha and of Oppenheim They are interpreted as a form of parapsoriasis having an acute course the lesions tending to undergo necrosis (Rusch's case had echthymatous lesions), this acute course is manifested by the pronounced vascular dilatation, the intense cedema and the marked perivascular infiltrate

Summing up the clinical characters of the ten

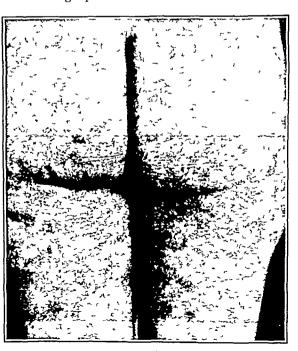

Fig 7 Parapsoriasis Maculata Rear View of Same Patient as shown in Fig 6

reported cases, Almkvist says They have the following features in common

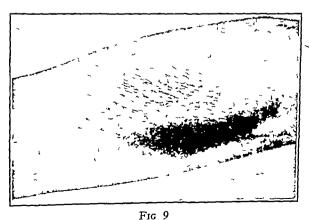

1 A papular exanthem simulating syphilis or pityriasis lichenoides chronica, with or without pruritus

Parapsor asis Maculata

Showing widely disseminated macular lesions, of brownish-clow color, devoid of scales, having a tendency toward linear arrangement

2 Beside these papules there are also a number of more inflammatory papules surrounded by a red halo, and papules having a vesicular or pustu-

Parapsoriasis Maculata
Showing brownish-yellow patch on the forearm of a woman The surface is wrinkled, and appears to be faintly atrophic

lar dome, some of which have central necrosis, the latter become crusted, and the crust becoming detached, leave variola-like scars, the appearance is like that of malignant syphilis

3 The acute course, the evolution of the eruption takes place in six weeks to a couple of months, the disease healing spontaneously and showing no pronounced tendency toward recurrences

Adding these two new types to Brocq s triad, the student is confronted with five more or less well-defined and clinically differentiable eruptions, which, to make the teaching more facile and to render the subject more comprehensible, we gro pun ler the designation parapsoriasis. To these

Fig 10

Parapsoriasis Maculata
(Parapsoriasis en plaques) From Darier's Text Book
of Dermatology Translated by Pollitzer Lea and
Febiger, Phila, 1920 Showing the retiform variety of
eruption

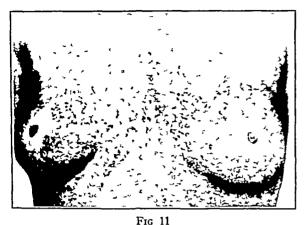

five types a sixth—parapsoriasis inixta—should be added The important point for the student to bear in mind, is the fact that transitional eruptions and mixed eruptions are by no means uncommon

In one of his scholarly articles, Riecke urges that Brocq's nomenclature be discarded in favor of one which is less complicated and more in conformity with the characters of the eruptions, he proposes two names to designate Brocq's three types

- a Pityriasis lichenoides chronica
- b Erythrodermia maculosa perstans (or chronica)

By this means he groups the guttate, lichenoid,

nodular, psoriasiform and the parakeratosis variegata varieties under one head, and the macular varieties under another. But this was

Parapsoriasis Atrophicans (Kreibich)
From Kreibich Parapsoriasis Atrophicans Arch f
Dermat u Syph, 144, 1923, p 476

written before the two new varieties, and the mixed eruptions, were described, for present-day teaching purposes this grouping is not adaptable

It would seem, therefore, that to simplify the nomenclature, the wisest plan would be so to name these eruptions as to conform with existing and accepted usage obtaining in other diseases having polymorphous eruptions, of which syphilis is the best example syphilis maculosa, papulosa, nodulosa, squamosa, pustulosa, gummosa, and so forth

With this viewpoint in mind, the following "working," classroom nomenclature is suggested

1 Parapsoriasis Guttata—The lesions are pinhead to pea-size, pale-red or reddish-brown in color, slightly infiltrated, covered by a dry, adherent scale, which, when forcibly removed, leaves a red, purpuric spot, but no bleeding points. The eruption resembles psoriasis guttata. This type includes the "Peculiar psoriasiform and lichenoid exanthem" of Neisser, Jadassohn's and Juliusberg's "dermatitis psoriasiformis nodularis" and "pityriasis lichenoides chronica"

2 Parapsoriasis Papulata—Varieties

- a Lichenoid
- b Nodular
- c Reticular
- d Striated

This form differs from the preceding in that the lesions are more pronouncedly papular in character, the infiltration is more advanced and there is less scaling. Some of the papules have central depressions and glistening surfaces, thus resembling the lesions of lichen planus. The lesions may be scattered or they may occur in more or less grouped reticulate fashion, chiefly on the trunk and extremities. Occasionally the entire

eruption occurs in bands and stripes This type includes Unna, Santi and Pollitzer's "Parakeratosis variegata" and Crocker's "Lichen variegatus"

3 Parapsoriasis Maculata — Varieties

- a Plaque or discoid
- b Reticular
- c. Xanthous

In this form the lesions are essentially macular and disseminated, or widely distributed. Scaling may be faint or entirely lacking. There is an absence of infiltration. The color of the macules may be yellow, salmon-yellow, purple, violaceaus, red or brownish-red. The lesions may be round, oval, striate, reticulate or banded. In some cases the lesions coalesce to form widespread, network-like areas on the trunk and thighs. Some of the

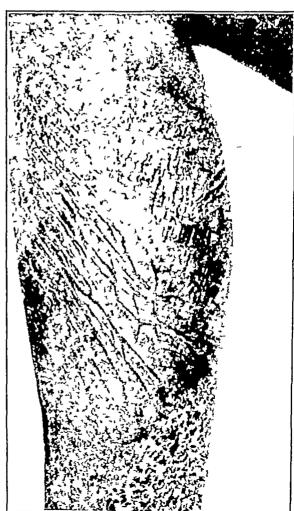

Fig 12

Parapsoriasis Atrophicans (Kreibich)
From Kreibich Parapsoriasis Atrophicans Arch f
Dermat 11 Syph, 144, 1923, p 476

eruptions resemble seborrheic eczema, early leprosy or early mycosis fungoides The surface of some of the lesions often appears to be wrinkled

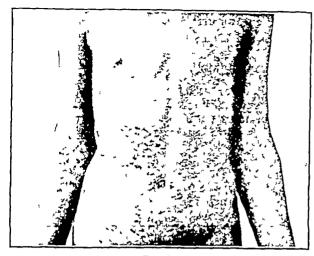

Fig 13 Pityriasis Lichenoides et Varioliformis Acuta (Habermann)

From Habermann Dermat Ztschr , XLV , Sept , 1925, p 44 (Suggested Designation Parapsoriasis Varioliforms)

-somewhat shriveled-and faintly atrophic This type includes Brocq's "Erythrodermie pityriasique en plaques disseminees," Crocker's and J C White's "Xantho-erythrodermia perstans" and Rasch's "Pityriasis maculosa Rasch's chronica"

- Parapsoriasis Atrophicans (Kreibich)
- Parapsoriasis Variolifornus Pityriasis lichenoides et varioliformis acuta (Habermann)

Parabsoriasis Mirta

That this scheme of nomenclature and classification has its defects, and that it will be subjected to adverse criticism, is a foregone conclusion Nevertheless, I deem it to be at least an improvement over the existing method of presenting the subject to the student of dermatology

PHYSICAL MEASURES IN GENERAL PRACTICE*

I Thermal Measures, Including Diathermy

By RICHARD KOVACS, M D, NEW YORK, N Y

GENERAL REVIEW OF PHYSICAL MEASURES

THE employment of physical forces forms an important phase in the modern treatment of diseases and injuries. Heat and cold, sunlight, water, massage exercise, and the various forms of electrical currents can influence powerfully the human body in part or as a whole. Physical methods, acting as outside repair forces, adding extra energy, help to repair the tissues of the body, relieve pain quiet inflammation, kill germs, restore normal function and improve the condition of the entire body. (Fig. 1) The appended chart endeavors to show in condensed form the character and some of the principal effects of the main physical measures. We must emphasize

			=
Hot water Hot air Radiant heaters Incandescent lamps Sun Diathermy	}	THERMIC	Relaxation of tissues Hyperaemia Relief of pain Attentuation or killing of germs Reflex stimulation
Cold water	}	CALORIC	Contractios of tissues Anaemia
Sun Heated metals Carbon arc Mercury vapor arc	}	PHOTO CHEMICAL	Erythema of skin Killing of germa Relief of pain Increase of solid con tents of blood
Galvanic current and variations	}	ELECTRO CHEMICAL	Pos pole { vaso- construction acid reaction Neg pole { vaso- dilata tion alkaline reaction Interpolar—metabolic
Interrupted wave and alternating currents Vibration Massage	}	DYNAMIC	Muscle and tissue con traction Increase of venous and lymph flow, stretching of tissues reflex stimulation

All effects may be mild (stimulation) or exaggerated (destruction), local general or reflex according to the intensity duration and area of application.

Figure 1
Chart of principle physical agencies and some of their effects

(1) that almost any of these measures may bring about effects ranging from mild stimulation to complete destruction of tissue, according to not only the intensity, duration and area of application but also—viewing the individual equation of the patient—according to his local

and general condition, (2) similar results may be obtained by different physical agencies on pain may be relieved by different bases thermic measures, due to improvement in circulation and the specific analgesic action, or by mechanical measures, due to relief of pressure, breaking up of adhesion, etc Mobility may be restored by heat, due to relief of spasm, by mechanical measures, these breaking up adhesions or removing infiltration, or by electrochemical measures, that soften scars evident, therefore, that a complete history and diagnosis, a full understanding of the underlying pathology is absolutely necessary for the choice and proper application of physical therapy It is often said that electrotherapy and like measures act only on the minds of patients, especially on account of the imposing appearance of the apparatus employed No one can deny the fact that any therapeutic measure, be it a prescription for drugs or an operation, always has a certain amount of psychic influence Any experienced physical therapist will corroborate the fact, however, that the poorest and least lasting results are obtained in mental mal conditions

Very few physical measures exert a strictly local action-because, by increasing collateral and deep circulation and by various reflexes, they act on remote organs and on the body as a whole Some of the general action can be enumerated thus (1) on the nervous system, either by a tonic, a stimulant or a soothing, sedative action, (2) on the circulatory system, peripheral vaso-construction or vasodilatation, following with an increase or decrease in blood pressure, (3) on the hematopoietic system in which one may note an increase of hemoglobin, of blood cells, of bactericidal properties of blood, (4) on the gastrointestinal system-by increase of general abdominal tonus, relief of spasm, (5) on the renal system—through increase of elimination, (6) on the endocrine system—by its stimulation These secondary effects often make the explanation of some of the results seem rather complicated and subject to varying interpretations

The main advantage of physical measures is (1) that most of the time they are capable of direct local application to the affected part, (2) that their dosage is fairly accurate, (3) their action is usually prompt, (4) that there is a comparative lack of idiosyncrasy toward them, and thus within individual differences a fairly uniform response can be expected. The application of physical measures never runs

^{*} Part of a course of lectures on Physical Therapy, arranged by the Committee on Public Health and Medical Education of the Medical Society of the State of New York, given before the Columbia County Medical Society and also read in part before the Kings Queens and Nassau County Medical Societies and the Medical Association of Greater New York in the Spring of 1928

counter to other indicated medicinal bi surgical measures, indeed they should be used as adjuvants in most cases and as specifics in but a few. It is an undisputed fact, however, that in many painful conditions proper physical measures will obviate the necessity for sedatives or narcotics.

The successful application of physical therapy does not require a large office equipment. It should be within the means of any general practitioner to give his patients at least some of the basic forms of physical treatments with good results. To use a homely comparison, while the majestic organ in a big cathedral will produce magnificent harmony, the same air brought forth on the smaller keyboard of a country church organ may exert often an even more impressive effect. It is the harmony and precision, and not the elaborateness of the execution, which are effective

We will turn now to the detailed presentation of some of the measures best suited for application by the general practitioner

THERMAL MEASURES

Physics of Heat Heat is a form of energy and consists of the internal vibration of the molecules of which a body is composed can be transferred by (1) Convection a difference in temperature between different parts of liquids or gases results in a bodily movement of the same, (2) Conduction if a solid substance is heated at one end, the heat passes along without setting up movements in the substance as a whole Metals are good conductors of heat, non-metals are bad conductors (3) Radiation represents the transmission of heat from one body to another while they are completely separated Heated substances send out heat waves which consist of the short infra-red waves of the electromagnetic spectrum As these waves become shorter and increase in frequency, due to more intensive heating of the emitting substance, light waves are produced Infra-red waves penetrate about 134 inches into the human tissues, light waves not more than one-fifth of an inch but, when impinging upon tissues, they are transformed into heat and thus form conversive heat Deep heat production in the tissues by the high frequency current is also based upon the conversion of the oscillating energy of this current into heat

In ordinary clinical practice we detect little difference between the effects of the heat emanating from various sources, such as the conductive heat from hot water, the convective heat of hot air or the heat from radiation. As a matter of fact, here is a continuous interdependence of these three methods of heat transmission. For ease, convenience and safety of application, however, the modern radiant light and heat applicators are most preferable.

Local Effects of Heat No matter from what source heat is derived, when absorbed by the tissues its energy is transformed into some form of cellular activity. This activity will manifest itself according to the area of and the application and intensity of source, either locally or generally

The local application of heat results in the following action (1) Relavation of tissues, particularly of the voluntary and involuntary muscle fibers. Active hyperæmia occurs following the relaxation of the smaller arteries. The increased arterial flow brings on more oxygen with improved nutrition, and the increased venous flow carries away in a larger degree the products of local metabolism. Thus the process of repair, as in healing of wounds after injuries, is speeded up

- (2) Relief of local pain. There is no generally accepted explanation for the analgesic action of heat. The diverting of blood from congested parts by collateral hyperæmia, or the acceleration of blood movement by relieving vascular stasis, may be used in explanation. Heat in some way lessens nerve sensibility, perhaps as a result of inhibition through the temperature nerves of the skin. It is to be noted that tactile sensibility of the skin increases at 98° F, decreases at 113° and at 130° disappears entirely, when at this temperature painful sensations are experienced.
- (3) Bactericidal effect Hyperæmia by itself results in increased phagocytosis, but there is also a direct inhibition of germ activity, according to the sensitivity of the particular organism. A rise of temperature of a few degrees is prejudicial to the existence of gonococci in living tissues

The local application of heat is therefore indicated in a host of traumatic conditions, such as contusions, sprains, fractures, traumatic arthritis and myositis, and in inflammatory or infectious conditions such as boils, abscesses, conjunctivitis, coryza, sinusitis, otitis media, bronchitis, local septic infections, various forms of arthritis, endarteritis, neuritis. Indications for the application of deep heat will be presented under diathermy

Radiant Light and Heat The reflected energy of an incandescent bulb, preferably with a carbon filament, forms the simplest, safest and most effective method of applying heat, both locally and generally No physician's office nowadays should be without one of these inexpensive devices. They consist of an electric bulb mounted in the center of a parabolic reflector. According to the intensity (wattage) of the bulb and the size of the reflector, smaller or larger areas can be exposed to heat and light. The small lamps contain bulbs of from 150 to 250 watts, while the largest ones contain bulbs

of 1000 to 1500 watts These high candle power lamps are marketed under the misleading name of deep therapy lamps Their rays, however, do not penetrate any deeper than those of the small lamps—about one and a half inches. The spectral analysis of the rays emitted of these lamps is as follows Infra-red rays 93%, light ray, 6%, 1 ltra-violet 1%, the latter rays, however are being impeded by the glass of the bulb It is evident, therefore, although we speak of therapeutic lights, that the main action of these applicators depends on the infra-red factor The therapeutic action of the rays of the visible spectrum is largely undetermined, there is some evidence of a more stimulative action of the red-yellow portion and of some sedative action of the violet-blue portion, and a questionable amount of photochemical action

The technic of application is very simple The lamps must be attached to a suitable stand (hand lamps are entirely unsatisfactory) and their rays, at a distance of comfortable toleration, directed to the area to be treated may be from two to three feet, according to the sensitiveness of the patient, the wattage of the bulb, and the type of reflector The exposure is given from fifteen minutes to half an hour and can be repeated several times a day, if necessary In case of peripheral nerve injuries, with disturbance of sensation as also, over scars with lack of sufficient collateral circulation, distance should be one and a half times that over normal skin surface, to avoid the danger of blistering In inflammatory conditions, this application alone will give the desired relief, especially if used for at least In trauhalf an hour, as often as necessary matic conditions the application of heat is best followed by a mechanical measure such as massage, the static wave or the sinusoidal current

Two or more electric bulbs of small candlepower mounted in semi-circular containers have been used extensively under the name of electric light bakers, another misleading expression, as baking would indicate coagulation of albumin, which occurs at about 160° F, whereas the body temperature, especially on the surface, hardly ever exceeds 110° F These "bakers" cover the parts at close range and therefore may give rise to accidental burns, especially in restless patients Their larger types are also rather cumbersome to handle On account of these drawbacks they have been largely replaced by radiant light and heat applicators as described

Dry Hot Air and Whirlpool Baths Other types of apparatus for local application of surface heat include dry hot air ovens and also whirlpool baths. The former are expensive, complicated and dangerous to handle although, on account of the increased skin toleration towards dry hot air, better results are claimed

Diathermy has given better and easier results, however when properly applied pool baths consist of water at a temperature from 100° to 110°, rapidly agitated in a container by its own pressure or by compressed air or by a suitable motor Such whirlpool baths furnish a combination of heat and gentle massage and improve local circulation effectively in conditions of peripheral nerve injuries, indolent ulcers, adherent scars, osteomyelitis of terminal phalanges, as well as in recent fractures immediately after removal of the cast The installation of a regular whirlpool bath with a thermostatic valve and a Monell metal basin is expensive and requires special plumbing and an abundant hot water supply Recently, however, a simplified type of cheap portable whirlpool bath has been brought The principal difference between moist and dry forms of heat is that moist heat acts more intensely on the surface, because humidity leads to heat stagnation and external radiation cannot get rid of the bound heat. When applying radiant light and heat, on the other hand, deeper effects can be obtained if the skin surface is cooled simultaneously by a fan or other device and thus heat toleration on the surface is increased

General Application of Heat Any of the foregoing means of applying local heat can influence the general body economy if applied beyond a certain intensity, duration and area For ordinary clinical usage, however, we consider general effects only when most of the body surface is subject to heat application General applications of heat result in (1) increased heat elimination, profuse perspiration, (2) increased circulation, rise of the pulse rate in the ratio of about ten beats for each degree Fahrenheit, much as it does in fever, (3) a lowering of blood pressure in contrast to the effects of cold, (4) increased respiration, (5) increased elimination through the kidneys As a result there is a loss of water, salt, urea, and other nitrogenous substances, with a relative excess of alkali remaining in the blood and in the tissues, while there is also a temporary loss of body weight General nervous sensibility is usually markedly lessened, although too prolonged and excessive heat application may cause profound depression

The general application of heat is accordingly indicated in conditions of impaired metabolism, in rheumatoid arthritis, in certain forms of nephritis, neuroses and psychoneuroses—in the latter conditions when combined with hydrotherapeutic stimulation by the hot and cold douche, in chilling after exposure, shock following injury or loss of blood

The apparatus for the general application of heat consists of electric cabinet baths, hot air ovens, or of various hydrotherapeutic proced-

ures, most of which, however, are beyond the range of a general practitioner's means of installation and application

DIVIILRMY

Physics Heat can be applied much more effectively, penetrating the body tissues through and through, and thus affecting internal organs directly, by employing diathermy. This signifies the bipolar application of the high frequency current, which differs from all other forms of electricity through the absence of sensory effects or muscular contractions. The extremely rapid alternations of the current—(Fig. 2) about one million per second—preclude the development of electrochemical reactions on which the polarity and the neuro-

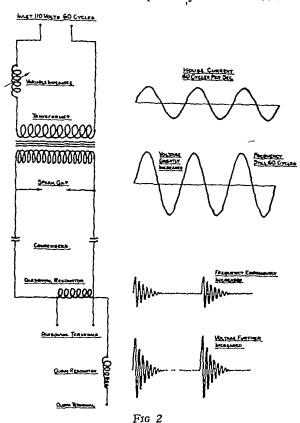

Diagram of wiring of high frequency apparatus and graphs of currents produced by each part of machine

muscular effects of the galvanic, faradic, sinusoidal, and static currents are based. Even if under the extremely short impulse of an oscillation any ionic movement should take place, it would be immediately counteracted by an opposite impulse. All that happens, therefore, is that the rapidly oscillating electromagnetic waves are transformed into thermic energy. If diathermy is properly applied, the patient has no other sensation except that of gentle warmth. All medical forms of high frequency currents are painless if kept within the limits of physiological heat toleration. By intentionally increasing the current density, surgical destruction can be produced.

A simple and convincing demonstration of the powerful but harmless character of the high frequency current is made by having an individual hold a metal cylinder in each hand, one cylinder is connected to one binding post of the high frequency machine, the other to an electric light bulb connected to the other binding post. As soon as the current is turned on, the lamp lights up brightly, yet the individual, through whom the current activating the lamp passes, perceives practically no sensation

Physiological Action There are ample animal experiments and other proofs available to show that the diathermy heat is actually developed in the depth of the tissues The most notable of these experiments are those recently published by Binger and Christie of the Rockefeller Institute of Medical Research conclusions are (1) the heat gradient of the body is reversed during diathermy and heating occurs from without inward—the maximum heating occurring at the point of greatest concentration of the lines of current flow, (2) deep heating during diathermy is greater than that which results from the application of local heat to the skin, (3) the lung can be heated by diathermy in spite of simultaneous cooling of the chest wall They consider their experiments on living bodies as satisfactory evidence of the passage of the current through the in-We can therefore justly terior of the body assert that diathermy enables us to raise the temperature of any part of the body, or of the entire body Whether there is any other effect than that of penetrating heat still remains a question to be solved

Depending on the histologic construction of the tissues and their quantity of blood supply, a varying degree of heat will develop under diathermy There are definite measurements available of the resistance of human tissues to electrical currents, the degree ranging from the lowest resistance of muscle to skin, liver, lungs, brain, tendons, fat, to the highest one of bone If we want to heat up tissues with more resistance, like the bony and ligamentous parts of a joint, they must be placed in the shortest path of the current This is done by two metal electrodes placed on opposite sides of the joint in "transverse' position. Internal organs are best treated by being placed in the direct path of the current between two electrodes on opposite surfaces of the body, the size of electrodes corresponding with the area to be treated (Fig 3) Soft parts of an extremity, muscles, nerves, periarticular structures are best treated by the "longitudinal" method, being placed between circular cuffs or suitably shaped plate

electrodes Mucous membranes, on account of their more ample blood circulation, tolerate a much greater amount of heat than the skin Experiments have shown that human tissues

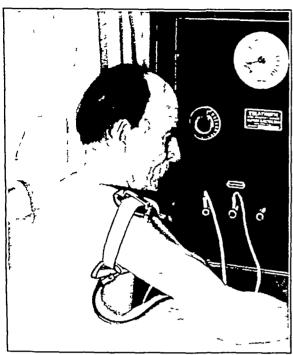

Fig 3
Transverse application of diathermy to shoulder

can tolerate about 116 to 118 degrees Fahrenheit, without damage

Therapeutic Action 1 Heat effect active arterial hyperemia, which increases both the local and general body metabolism. As a result there is increased secretion of glandular organs, of lymph, and of urine. The resorption of inflammatory exudates is promoted in both acute and chronic traumatic and inflammatory conditions, of extremities as well as of internal organs, such as arthritis, myositis, bursitis, bronchitis, pneumonia, chronic cholecystitis, pelvic inflammations, sinusitis, etc. (Fig. 4.)

- 2 Local relief of pain is explained by the much deeper action on all nerve endings, as compared to the more superficial action of other means of heat application. This analgesic action adds to the favorable influence of hyperemia in many acute inflammations. Many forms of neuritis, neuralgia, myalgia, and arthralgia respond.
- 3 Antispasmodic action specific in contrast to the irritating action of the other electric modalities. Attacks of angina pectoris, as well as spastic conditions of the stomach intestines, and gall bladder, have been relieved
 - 4 Bactericidal action especially evident in

heat sensitive organs, such as the gonococcus and the pneumococcus. The deep heat of diathermy diminishes the vitality of the germs and increases the power of tissues to resist. Convincing proof on gonococcal infection was furnished by Cumberbatch, by the disappearance of pain and swelling from joints or scrotum after the application of diathermy to the site of the infection, the prostate and seminal vesicles in men or the urethra and cervix in women

Monoterminal and Surgical Forms Oudin terminal of a diathermy apparatus furnishes a current of higher voltage, which causes electric charges in vacuum or nonvacuum glass electrodes Applying this "monocurrent to the patient with the terminal" newer type of the silver-lined "condenser" electrodes, real surface heat and mild counterirritation is produced These surface applications will benefit mild forms of traumatism, neuritis and myositis, and subacute forms of polyarthritis In drug stores and electrical stores a toy imitation of the real monoterminal high frequency current is sold under the name These flimsy devices of violet-ray machines produce a weak alternating current, and while they similarly light up glass vacuum electrodes, the violet color in these has naturally nothing to do with ultra-violet rays Their therapeutic efficiency amounts to that of an average liniment with some pricking sensation and electrical display added

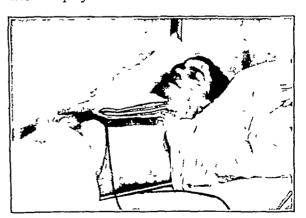

Fig 4

Applying diathermy to chest, for pneumonia or bronchitis.

If the current from the "Oudin" terminal is concentrated on a fine steel needle held in an insulated handle, it will destroy benign blemishes and neoplasms of the skin and mucous membranes, as warts, nevi, moles, leukoplakias, with good cosmetic result and little pain. Mild application will cause slow evaporation of the tissue fluids, the area treated

turns into a dry mass, hence the name of this process desiccation If instead of the Oudin terminal the needle is connected to one of the diathermy outlets and a large "inactive" electrode placed on some remote part of the body is connected to the other outlet, a current of much larger volume is produced, which in turn develops a penetrating and immediately destructive action under the active electrode This procedure is termed electro coagulation, and offers a valuable method in treatment of larger neoplasms and malignancies in accessible locations Properly applied, the operation is bloodless, performed quickly, with a minimum of trauma and shock, with little post-operative pain or local reaction, and is usually followed by very acceptable cosmetic Through the preliminary sealing of the adjacent lymphatics and blood vessels, the danger of metastasis is materially reduced Local or general anaesthesia is necessary, however

Diathermy furnishes a unique therapeutic measure applicable to the entire field of medicine and surgery It is often indicated per se, often again, it will effect its best results only when properly combined with other physical It is contra-indicated (1) in acute inflammatory processes accompanied by fever, (2) in the presence of non-draining suppuration, (3) in tendency to hemorrhage, (4) in suspected malignancies (except when surgically applied) It is relatively contraindicated when simple forms of surface heat are sufficient, -a question which can be settled only by the experienced

The technique is comparatively simple and can be readily mastered by the practitioner of medicine, by actual work under an experienced teacher It must be based, however, on a broad knowledge of the elementary principles of electro-The standard type of portable apparatus furnished by a reliable manufacturer suffices for practically all routine work

PSORIASIS

A Preliminary Report of Blood Chemistry Studies and Indications for Treatment as Shown by These Findings

> By BINFORD THRONE, M D, and C. N MYERS, Ph D, BROOKLYN, N Y From the New York Skin and Cancer Hospital

SORIASIS is one of the most common skin diseases, ranking about fourth in both dispensary and private practice lts essentially chronic nature and its tendency to recur are well The symptoms of the condition need no description and the diagnosis is easily made except in the so-called generalized cases

The causes of Psoriasis have been attributed to almost every thing from gout and rheumatism to disturbances of the endocrine glands and of the

vegetative nervous system

Practically all authorities dismiss direct hereditary transmission of the disease, on the other hand all admit an mate or inherited predisposition of familial type which causes these persons to react in the form of Psoriasis The statistics of this inherited predisposition vary according to different authorities from 15 to 44 per cent Schamberg a found it in 13 per cent of his cases, Furst' found it in 36 per cent Furst also found no evidence of consanguinity and no especial

association of Psoriasis with constitutional or with other skin diseases

Dr L Duncan Bulkley taught in his lectures at the New York Skin and Cancer Hospital that in Psoriasis there was an imperfect protein meta-His rice diet in this disease has had bolism many disciples Schamberg 1 in his report claimed to have found a marked retention of nitrogen He stated that patients suffering in his cases from Psoriasis exhibit a remarkable retention of This retention appears to be proportional in a general way to the extent and severity of the eruption present "A low nitrogen diet has a most favorable influence upon the eruption of Psoriasis, particularly when the latter is extensive" In a later article? he stated that the average uric acid findings in eleven cases of Psoriasis was 32 and concludes that patients with Psoriasis, Acne, and certain other cutaneous diseases have a lower average uric acid blood content than those suffering from eczema, and in a still

later paper³ Schamberg says on the basis of the above findings 'Let gout as an etiologic factor in Psoriasis therefore be thrown into the discard of antiquated conceptions". In this same paper he reiterated his belief in a nitrogen retention but he stated that there had been no independent investigations to confirm or negate this finding

Bacterial or mycotic causation has never been proven It has been pointed out that the tendency of the disease to recur in the spring and in the fall points to such an origin Its sharply marginated lesions, their clearing in their centers, their location at points of pressure are given as indications for microbial origin. The therapeutic remedies which are most effective in this condition, namely arsenic and mercury, according to Gordon⁵ would seem to indicate a spirochetic infection Spirochetic infections however respond to the arsphenamine arsenic and do not respond to the morganic or pentavalent form of this metalloid Until positive proof is brought forth microbial infection in Psoriasis will have to be denied

Endocrine association has never been scientifically shown. These glands have great influence on all metabolic activities, but no direct causative relationship between their action, either hyper or hypo functioning, has been proven. Bernhardto thinks that there is some hereditary specific property of the skin to react and that certain external causes which act as irritants can be defined. His statistics show thyroid deficiency in 42 per cent of his cases, gonad deficiency in 22 per cent and Thymus deficiency in 21 per cent. He states that the physiology of the endocrine glands is not yet sufficiently understood for any etiological conclusions to be drawn

Levy-Franckel and Juster' claim that abortions occur frequently in women with Psoriasis from childhood and a negative Wassermann test but with a hisory of Syphilis in the family. This suggests to them that hereditary and familial transmission of the disease may be due to Syphilis which may create a special skin, gland or humoral predisposition, a syphilitic dystrophy

Strickler and Asnis⁸ were unable to find any form of spirochetes and the Wassermann reaction was negative in their series of thirty-four cases

They found a moderate lymphocytosis in the blood of 81 per cent of 27 patients. None of these 27 patients showed an eosinophilia, the highest was 4 per cent. The absence of eosinophilia is decidedly against Psoriasis being of anaphylactic origin.

Reports of repeated blood chemistry studies in Psoriasis are lacking. Many investigators have published the result of one such examination on individual patients, but as we have stated in former articles, we do not consider such an examination is of much importance. Among the more recent communications may be mentioned that of

Struemke and Soika^o who found one case out of five showing hyperglycaemia and an increase of calcium in five of eleven cases. Percival and Stewart¹⁰ claim that an increase or decrease of the blood serum calcium was not found to be a constant feature of any of the conditions examined—Psoriasis among others—and that such derangements as were found do not appear to be due to any significant derangement of the calcium metabolism

Garbit¹¹ has announced a most interesting finding in Psoriasis He claims that in this condition in the psoriatic plack and in the circum plack area for 1 to 1½ cm there is a total lack of sebaceous and sweat secretion. Biopsy showed the glands well developed. As a cure takes place secretion is resumed. This finding, if corroborated, would seem to show that Psoriasis has for its cause a functional trouble of the secretory nerves.

Ravaut and his co-workers12 showed at the meeting of the French Dermatological Society in June, 1925, three cases of psoriasis in whom Insulin had caused the disease to retrocede One of these cases had hypergly caemia and came of a In all three cases pruritus was diabetic family marked At a later meeting they reported a more complete study of ten cases Darier had advised that the cases he studied in regard to their metabolism of fats, carbohydrates and proteins, and that the functioning of certain organs, especially the liver be investigated. In each of these ten cases the blood was examined for sugar, cholesterm and urea The urme was examined to ascertain the liver function, examination was done for urobilin, bile salts and pigment, the amino-acidolytic and Maillard's coefficients were Of the ten cases, six showed deficient liver function. In these, the analyses showed urobilin in large amount, elevation of Maillard's and the amino-acidolytic co-efficients and hypercholestermaemia Two of these six also showed hyperglycaemia The patients were then treated with insulin, an average of 45 units being injected daily The injections were given over a period of twenty days to two months. The action of the insulin was either transient or negligible In their conclusions they state "Psoriasis not accompanied by hepatic insufficiency was not modified by insulin ' "The action of insulin in Psoriasis is only transient as it is in Diabetes " Upon the recidives the action of Insulin was incon-

Lortat-Jacob and others at the same meeting reported cases showing varying results from Insulin treatment. They also discussed the relationship of Psoriasis to hereditary Diabetes and thought that sufficient attention had not been paid to this element in the causation of the disease. They gave histories of patients with a diabetic family history and compared them with cases of Xanthonia with similar family histories. They

said that on the basis of the published facts one can admit that insulin acts in modifying the soil. They concluded that hypercholesterinaemia might have been the cause of the failure of insulin treatment.

Bernhardt and Zalewski¹³ concluded after extensive studies "that the variations of the blood content in cholesterol does not appear to have any affect upon the evolution of Psoriasis"

In a previous paper¹⁴ we reported two cases of Psoriasis In one of these cases the disease was very wide spread, in the other it was universal In the urine of each of these patients arsenic was found in pathological amounts These cases also

showed hyperglycaemia

With the above facts in mind we instituted a systematic blood examination in a series of consecutive cases applying for treatment in our service at the New York Skin and Cancer Hospital In these examinations the blood sugar, chlorides, urea nitrogen and uric acid were deter-The blood examinations were done at frequent intervals (one or two weeks) because we had found and are firmly convinced that one blood determination on one patient means practically very little The Whitehorn method for chlorides and the Hastings-MacClean method for sugar were used We consider the normal amount of sugar to be 0 090 gmmes per 100 c c of blood, and 0 450 gmmes of chlorides in 100 cc of blood to be normal

In this study we examined and treated 35

In all cases no signs of nitrogen retention werefound as shown by an examination for urea nitrogen and uric acid. On the contrary a few cases showed a low urea nitrogen, which was probably due to deficient liver function

In four cases the blood sugar and chlorides

were normal

Two cases showed positive diabetes mellitus One of these was a Jew aged 56 years His blood sugar was on first examination 191 gmms per 100 cc of blood, an examination a few weeks later showed 180 The other case showing diabetes was an Italian aged 55 years His blood slowed 212 gmms of sugar

Two cases showed a normal blood with the exception of a very moderate hyperglycaemia

In 15 cases a typical picture of a heavy metal retention was found. That is these cases showed a high sugar and a low chloride. As a result of several thousand observations this relation of sugar to chloride value has universally shown that this ratio is diagnostic. These cases were examined before we instituted treatment.

Five other cases had a blood examination after their treatment had been started. These cases had received injections of a gold compound, Triphal, and in each of these there had been a reaction of some type. Two other cases treated with gold injections showed a normal blood pic-

ture before treatment was instituted and they also showed some form of reaction. Associated with the reactions there developed in all of these seven cases the definite blood change which is seen in all cases of heavy metal poisoning regardless of their original condition. We have found this change in eczema, scleroderma, neuritis and paralysis from arsenic and in arsenical pigmentation.

Remarks on Treatment - Insulin as reported by the French observers has not been satisfac-One of the above cases showing diabetes was given injections of insulin over a period of three months With absolutely no benefit Lortat-Jacob's statement that hypercholestermacmia might have been the cause of the failure of insu-In treatment does not seem to be borne out. It seems that insulin has no effect upon the hypercholesterinaemia unless there is associated pancreatic deficiency as shown by its action in Xan thoma Tuberosum Multiplex Major15 reported a case of this condition which showed both hyperglycaemia and hypercholesterinaemia case injections of insulin caused a lowering of both the sugar and cholesterin and caused an improvement in the skin condition. On the other hand Ingram's case16 which showed hypercholestermaemia only and did not show any evidence of renal, hepatic or pancreatic insufficiency was not helped by insulin nor did the insulin have any effect upon the hypercholestermaemia It would seem that the beneficial effect of insulin in some of the cases of Ravaut and Lortat-Jacob was probably due to the fact that their cases also had an acidosis and that the action of the insulin was chiefly in lowering the hydrogen ion concentration and in relieving the acid condition and that its action in their cases of Psoriasis is comparable to its action in the cases of eczema reported by Drouet and Verain¹⁷, one of whose cases showed a marked acidosis and a low alkaline reserve and a blood sugar of 112, the chloride content was not stated

Gold Therapy -- Gordon's states that Skutezki reported favorable results from Triphal-a gold Swartz however did not have such preparation Swartz had to discontinue its use good results in three cases on account of severe after effects, one case developed a severe pruritus after the fourth injection, the pruritus increased with cach subsequent injection, and the patient developed urticaria, the 2nd case after a few injections (the number was not stated) developed a bad taste m the mouth, vomiting, cyanosis and severe headache, the third case after the second injection developed nausea, vomiting and interference with Ritter reported 21 cases treated with 11 cases Triphal—his results were as follows were cured with Triphal alone, in the other 10 cases he had to use chrzsarobin or X-rays doses Ritter used were very large, according to Gordon, reaching as much as one gm at one mechon

This line of treatment was tried by us in seven (7) cases. In five of these cases the gold treatment was started before a blood chemistry was done. Some of these cases were of sufficient interest to deserve a brief review.

The first case was a man aged 23 years who had had the disease constantly for three years The eruption was present in large sheets on the trunk, limbs and scalp The palms, soles and nails had never been involved. His previous treatment had consisted of Fowlers solution, potassium iodide and injections of sodium cacody-Externally he had used various ointments He was admitted to the Skin and Cancer Hospital on July 8, 1927, and was given six injections of Triphal of 0 100 gmme each The last injection was given on July 29 On July 31 he complained of fever, headache and general ma-The fever His temperature was 103 F lasted nine days During this period he developed stomatitis and gingivitis The rash became very inflammatory, a marked edema of the skin appeared The rash also spread very widely and became practically universal The palms and soles, which as stated above had never been involved, became affected with a condition clinically resembling Psoriasis His blood on August 7 showed sugar 1046 and chlorides 4121, on September 19 it showed sugar 92 and chlorides A marked alteration of the normal sugar 380 He was given injections of sochloride ratio dium thiosulphate and not only did the parts which had become involved during the reaction clear up but the old lessons also disappeared The other case was similar except that he had received injections of a bismuth compound previous to receiving the gold treatment case also the rash became universal, the palms and soles became involved In neither of these two cases had there ever been any involvement of these parts prior to their reaction following the gold injections

In the other five cases which received the gold injections there was a reaction of some severity in each as shown by extension of the rash or by pruritus. In each case there was an increase in the blood sugar, the highest being 130, and a corresponding lowering of the blood chlorides, the lowest being 380

The action of the gold upon the disease varied considerably. One case, a female, aged 25 years, cleared up completely after three injections of 0.075 gmme each but the rash recurred after one month. A blood examination at the time of the recurrence showed a sugar content of 123.2. Another patient, a female, aged 48 years, who had been affected with the disease for at least 20 years, was given two injections a week of the gold compound from August 31 until September 23 when she complained that new lesions were appearing. On that date her blood showed a sugar content of 130 and a chloride content of

404, in other words a marked elevation of the sugar and a corresponding dimunition of the chlorides. She was then put on injections of sodium throsulphate 0.5 gmme three times a week and on October 19 her sugar had gone down to 96.2 and her chlorides had gone up to 437. Coincident with this change in the blood there was an improvement in the skin condition. The gold injections were resumed on October 25 and on November 21 her blood showed 136.9 sugar and 437.7 chlorides per 100 c c of blood.

The other three cases showed similar findings to those mentioned above

In all these cases showing a reaction to gold the use of sodium thiosulphate proved to be specific for the reactions

From our experience with gold therapy in Psoriasis we believe that if the patient has a heavy metal retention as shown by blood findings, that is a comparatively high sugar and a corresponding low chloride, the use of gold is attended with the danger of severe and serious reactions Patients who have focal infection are also prone to react to gold as we showed in our work¹⁸ on Lupus Erythematosus

Four patients were examined who denied having received any treatment. The duration of the disease and the blood findings in these cases were as follows

Case 1—Age of patient 21 years Duration of disease one year Blood normal

Case 2—Age of patient 8 years Duration of disease 5 weeks Blood normal

Case 3—Age of patient 38 years Duration of disease 2 months Blood normal

Case 4—Age of patient 62 years Duration of disease 2 years Blood sugar 1138, chlorides 4293

Case 4 was an old illiterate Russian Jewess Her history was not satisfactory and probably was not correct. The clinical appearance of the eruption in all the above four cases was similar, the rash was present on the scalp, elbows and knees, the lesions were discrete and of the numular type.

Two cases which had received previous treatment, showed a normal blood picture. One of these patients had received only external applications, the other had been given, in addition to external treatment, injections of some arsenical preparation.

Bismuth—In addition to the case mentioned above, four cases had received injections of a bismuth compound before a blood chemistry was done. The duration of the disease in these four varied from one to many years (more than 10). Of these four cases three showed a high sugar and a low chloride content in their blood. One was definitely diabetic. The chloride findings in these cases varied from 404 to 437 mgms per 100 c c of blood and the sugar from 108 to 212.

The fourth case showed only a moderate hyperglycaemia, sugar 1112

Sixteen other cases were examined who had received some kind of treatment. Of these, eight claimed that they had only used external applications, seven stated that they had received arsenic in some form. One case denied any form of treatment but he said that in his work he used large amounts of the sulphide of arsenic. All of these sixteen cases showed a high sugar and a low chloride content in their blood.

Two cases who had received arsenical medication gave a normal blood picture, and two others showed only a high sugar but a normal chloride

Two cases showing the so-called metallic blood picture had the disease present in very large wide spread sheets with involvement of the palms Urine examination after an injection of Sodium Thiosulphate showed arsenic in pathological amounts - The first of these two patients was a man aged 40 years, his urine showed 0.033 mgms of arsenic per 100 gmms of dried speci-men The second patient was a woman of about the same age, her urine showed 0293 mgms of The condition in the man cleared up entirely with injections of sodium thiosulphate and the external use of an ointment of wool fat and petrolatum The woman was materially helped by these injections She disappeared from the clinic before treatment was completed

Some of the cases showing the metallic blood

picture are worthy of special mention

The patient with occupational contact with arsenic was a man 43 years of age. His occupation was a wool puller, in other words he pulled wool from sheep skins to prepare them for tanning, and applied sulphide of arsenic to them. He had been affected with the disease for six years. The eruption was present on the scalp, trunk and limbs in large sheets. His blood findings were as follows.

9/28/27 sugar 868, chlorides 4377 10/26/27 sugar 920, chlorides 4210 11/2/27 sugar 1060, chlorides 3880

At first it seemed that there was no arsenic element in this case but the findings after the thiosulphate injections showed clearly the sugar elevation and the dimunition of the chlorides. This change was not due in the least to the sodium thiosulphate, for in cases of eczema where there is no metallic element this blood change is never seen after these injections. He was markedly helped by the thiosulphate treatment.

Another case deserving special mention was a man aged 28 years who had been affected for nine years without disappearance of the rash He showed large sheets of eruption on scalp, trunk and limbs. His nails also were affected He had received arsenic both by ingestion and by injection. His blood examination on Nov 18/27 was as follows sugar 1032, chlorides

3968 He was put on injections of sodium thiosulphate three times a week. A blood examination early in Feb, 1928, showed that his sugar was 120 and the chlorides had gone up to 454. The lesions on his skin had almost entirely disappeared and much to our surprise the nails were coming in perfectly normally, the pitting and distortion which had affected the whole nail substance was present only at their free margins.

Mrs C T, Italian, aged 39, had had the disease continuously for eight years. It was present in very large sheets on her scalp, trunk and limbs. She was given the injections of thiosulphate three times a week and an ointment of lanolin and vaselin. The condition cleared up in

about two months

Many other cases in this group reacted in the same manner to sodium thiosulphate

SUMMARY

The family histories of these patients showed the following

In the families of two patients there was a

history of diabetes

In the families of four one other member had psoriasis

In the family of one patient one other member

had both psoriasis and diabetes

Two of these 35 patients showed diabetes mellitus. One of these was a Jew aged 56 years,

the other was an Italian aged 56 years

In this series, 35 cases of psoriasis were examined and studied. Of these 35 patients four claimed that they had received no treatment of any kind. Three of these four gave a normal blood picture. In the fourth case the history was not reliable.

Two cases which had received previous treat-

ment gave normal blood findings

Two cases having received previous treatment showed only a moderate hyperglycaemia

Seven cases received injections of a gold compound (Triphal) A reaction of some type was seen in each of these seven. The reaction varied from simple pruritus to generalisation of the eruption with severe constitutional disturbance as shown by fever and prostration. The severe reactions were seen in cases which had recently received injections of arsenic and bismuth respectively. In each of these seven cases there developed a distinct metallic blood picture after the gold injections. In no case was there any lasting improvement, one case, which cleared up after three injections, relapsed after three weeks.

Omitting the eleven cases which received either gold or bismuth treatment there were 24 cases left. Of these 24 cases four had received no previous treatment. Of the twenty which had received previous treatment, two gave a normal blood picture, two showed a high sugar only, while sixteen showed a distinct metallic blood.

In other words 75% of previously picture treated cases showed signs of a metallic retention

Examination of the cases showing a metallic blood picture showed two clinical types of the disease, in the first type the disease was present in discrete punctate or numular patches, in the second type large sheets of eruption was present and in a few of them the rash was universal In each of these two types there may be seen palmar involvement with at times involvement of the nails also In no case which did not show the metallic picture and in no case which had not received previous arsenical treatment was there any involvement of the palms or nails cases of this type, whose urine was examined for arsenic, arsenic was found in pathological amounts The urine was not examined in the other cases

In cases where the disease was present in large sheets or where it was universal, the disease process retrogressed under thiosulphate treatment and the external use of an emolient ointment Even the nail involvement responded to this line of therapy

Cases which did not show this metallic picture were not helped by the thiosulphate former paper14 we stated that it was our belief that Psoriasis per se never caused palmar lesions and that when the condition became generalized that it was not due to the pathological process of the disease but that these conditions were always due to a heavy metal retention and that the metal usually causing these symptoms was arsenic. The cases of generalization following gold injections seem to bear out that contention. Whether the local condition is due to a local deposit of the metal as has been found in the exfoliative dermatitis from the arsphenamines, or whether the local deposit of the metal acts as an irritant and the extension of the rash and the development of new lesions is simply an expression of Koebner's isomorphism, or whether the metallic retention is in some part of the body which is concerned with the genesis of Psoriasis, we do not Osborne's 10 finding of it in arsenical keratoses points to a local action, the perverted sugar and chloride metabolism and an abnormal glucose tolerance which we found in two cases, seem to show an added internal disturbance chiefly of hepatic origin Ravaut's findings of definite hepatic insufficiency in some of his cases we think were due to a metallic retention we showed in a previous paper14 acidosis favors the precipitation of arsenic in the tissues, the cases of eczema reported by Drouet and Verain, in which moderate hyperglycaemia and acidosis were found, were in all probability associated with a heavy metal retention Watrin²⁰ reported to the French Dermatological Society at the Strassburg reunion a case of Lichen Planus with a similar acidosis following arsenic injections In his case the arsenic seemed to cause an exten-

sion of the skin symptoms also. This patient reponded to alkalies and injections of sodium thiosulphate The retention of the arsenic was probably the cause of the acidosis Trusler and others21 have shown recently that in dogs poisoned with bichloride of mercury there is a relativé acidosis and a decrease of chlorides in the These findings we believe are additional proofs of our statement in the paper referred to above that the development of the diseased process in Psoriasis into large sheets of eruption or its spreading over the whole body with involvement of the palms, soles and nails, is in all probability due to a heavy metal retention, this metal is usually arsenic Associated with this metal retention the blood shows a comparatively high sugar and a relatively low chloride content Acidosis is also probably present

Conclusion

In this paper 35 cases of Psoriasis were stud-

No evidence of nitrogen retention was found in any case

Untreated, early cases of this condition show as a rule a normal blood as far as sugar, chlorides, urea nitrogen and uric acid are concerned

Sodium thiosulphate is of no value in the treatment of cases whose blood does not show our so-called metallic picture, that is a high sugar and a low chloride Sodium thiosulphate is of great value in those cases showing the metallic blood picture In cases with the disease process present in large sheets or where it is universal its action is frequently curative. Nail involvement has also responded to this line of therapy

The action of sodium thiosulphate in these cases is in removing the retained metal from regions in which it has been precipitated and in reactivating it. It also seems to have an action upon the accompanying acidosis

Gold therapy is not of any special value in the treatment of Psoriasis The use of gold compounds in this disease should always be preceded by a blood chemistry A high blood sugar and a low blood chloride are positive contraindications for gold therapy

We believe that Psoriasis per se never involves the palms or nails, and that it never occurs in large sheets or becomes universal unless there is a metallic retention

We do not make any claim that arsenic or any of the other heavy metals is concerned with the genesis of Psoriasis

SIMPLE TUBE DRAINAGE OF THE STOMACH AFTER ABDOMINAL OPERATIONS

A Simpler and Safer Procedure Than Lavage for Acute Postoperative Gastric Dilatation and High Intestinal Obstruction

By WILLIAM L WOLFSON, MD, FACS, and BENJAMIN KAUFMAN, MD, BROOKLYN, NY

HAT operations within the abdomen may result in serious dilatation of the stomach or retention of the gastric contents has long been known Practically all authorities recognize the necessity of passing a stomach tube and aspirating the gases and gastric contents in this condition, but the procedure generally employed includes gastric lavage as well In a series of postoperative cases studied at the United Israel-Zion Hospital we have been impressed with the superiority of the much simpler procedure of tube passage over gastric lavage We desire, therefore, to point out the advantages of this simple emergency measure which has actually proved life-saving in cases of acute postoperative gastric dilatation and high intestinal obstruction

HISTORY OF THE STOMACH TUBE

Few physicians are aware of the circumthonces under which the stomach tube was never ted and first used, yet the history of this edly helpenplement forms a most interesting

Another casdicine To Dr Physicki of Philaman aged 28 yea the credit of inventing the nine years without 793 His greatest success He showed large sheet as in 1812 when he trunk and limbs. His national empty the stome he had received arsenic both and According by injection. His blood examination and tube 18/27 was as follows sugar 1032, mach tube

An apparatus for extracting poisons from the stomach was proposed by Boerhave and perfected by Dupytren and Renault of France in 1803 Orfila's work, published in 1814, quoted Renault's description and described the procedure for emptying the stomach by mechanical means as follows

"The gum-elastic tube should be of sufficient length to allow its extremities to reach the most depending part of the stomach and of a calibre large enough to give passage to soft substan-It should have two orifices, one at each extremity, lastly, a ferrule of metal should embrace the external orifice which is to be Things received into the cannula of a syringe being thus arranged, the tube is introduced into the stomach by the mouth or nostrils, the syringe adapted to it and a certain quantity of liquid gently injected to dilute, hold in suspension or dissolve the poison. Then the piston is raised, a vacuum formed and some of the After contents of the stomach withdrawn these two operations have been repeated several times, the viscus is well washed and all the poison extracted without any violence and almost without any pain and in a very short time"

Jukes in 1822 swallowed a lethal dose of laudanum and then used the stomach tube on himself to extract the poison Using solutions of various colors, he demonstrated how gastric

lavage may be accomplished both in dogs and human beings Originally he employed a gumelastic bottle connected with the tube, but the addition of a syringe to the equipment was suggested later by Bash

Sir Astley Cooper⁵ in 1823 directed experiments on a dog at Guy's Hospital to ascertain whether fluids could be put into the stomach and then removed. The instrument, which was said to have been invented by Reed of Kent, consisted of a brass syringe with a capacity of 3 ounces and a tube proceeding from a point 1 inch above the mouth of the syringe and nearly at right angles to it. This contrivance gave the syringe two outlets for the attachment of two tubes.

it was as follows

"When any liquid was to be thrown into the stomach the mouth of the syringe was put into the vessel containing it and a long tube composed of elastic gum or leather with a joint in the middle previously put into the stomach was received into the cylinder from the vessel which was prevented passing back by means of a spherical valve in the mouth, when the piston was pressed down the fluid passed by means of the tube attached to the lateral opening into the stomach and any quantity of fluid might be injected into it. On the contrary, when it was wanted to empty the stomach of any liquid, all that was necessary was to change the position of the mouth of the syringe and the action was reversed. This experiment proved a success in the dog"

Since the date of its introduction the stomach tube has been constantly improved, being utilized not only as a means of treatment but also as a diagnostic aid. It is mainly for the purpose of emphasizing the value of the stomach tube in the surgeon's armamentarium and the advantages of its use in the treatment of postoperative symptoms after abdominal operations that we have written this article

Postoperative Gastric Lavage

While much has been written concerning the value of gastric lavage both before and after operations all authorities are in accord that this procedure may save life under certain circumstances. The question naturally arises, "What are the indications for tube drainage of the stomach in abdominal cases?"

The most important indication for tube drainage is furnished by the early symptoms and signs of acute postoperative dilatation of the stomach, namely, restlessness, discomfort, epigastric pain, increasing pulse rate, feeble hiccough or belching, pinched features, an annous look, and slight epigastric distention. These manifestations are followed by effortless vomiting of greenish or brownish fluid. Although the vomitus is brought up in large

gulps the act of vomiting is not distressing The abdomen finally becomes markedly distended or ballooned, respiration frequent and shallow, and the pulse more rapid and of poorer quality. Due to the persistent vomiting there is increasing thirst and the patient often becomes dehydrated. No relief being given, this condition may terminate in collapse.

The proper time to pass the tube and drain the stomach is in the very early stages of acute Then the procedure proves to be dilatation a most beneficent measure At that time, furthermore, it is most important to repeat the lavage as often as the distention appears or the The lavage patient is conscious of distress of the stomach should be continued until the This is the view exfluid is returned clear pressed by Moynihan,6 Finney,7 Horsley,8 Lewis, Parker, 10 Bickham, 11 Browne, 12 and Slocumb 13 all of whom believe that the stomach tube has saved the life of more than one patient with acute gastric dilatation

TUBE DRAINAGE OF THE STOMACH

In a number of cases of threatened or existing acute gastric dilatation on the surgical service of the United Israel-Zion Hospital from 1922 to 1927 we have employed the more simple procedure of tube passage Gastric lavage has been omitted entirely. Our results have convincingly demonstrated to us that tube passage can entirely supersede, the more cumbersome, protracted and difficult stomach washing.

Tube passage has many advantages over gastric lavage. The preparation for the procedure is simpler. The tube being ready at the patient's bedside it is not necessary to prepare warm saline or other solution, as when lavage is to be performed. In case of need, the physician passes the tube quickly and

gently into the stomach

The careful passing of the tube is simple and not objectionable to most patients who are usually so relieved that they welcome a repetition of the act when the stomach again becomes distended with gas or fluids. We have often emptied the stomach of its contents at half hour intervals. One has only to perform this procedure a few times in order to appreciate the immediate relief that it gives the Tube passage minimizes the dangers patient attendant upon emptying the stomach by mechanical means When gastric lavage is performed on a sick, gagging, or straining patient there is always the danger that some of the contents may spill alongside the tube and be aspirated deeply into the respiratory passages, possibly causing pulmonary complications—a not unusual occurrence This danger is avoided by simple tube passage

By eliminating most of the straining, gagging

or retching generally associated with lavage there is less burden to a weakened myocardium of past or recent origin There is less tension to the edges of the recent abdominal wound with decreasing likelihood of wound rupture and evisceration Furthermore, this safeguard applies not only to the wound in the abdominal wall but also to those in the stomach and intestines (gastric surgery)

Rose¹⁴ has shown that high intestinal obstruction produces a constant fall in the blood chlorides with a rise in the blood urea nitrogen. non-protein nitrogen and carbon dioxide combining power of the blood plasma By the work of Haden and Orr,18 the chlorides of the body have a specifically antagonistic action to a toxin produced in the obstructed gut lavage is performed in these cases of high obstruction, the chloride content of the blood already diminished to a dangerous degree will be further reduced For with the introduction of considerable quantities of fluid into the stomach there is of necessity a washing out of the hydrochloric acid from the cells in the gastric mocosa, which acid might be available to replenish the low chloride in the blood

When gastric resection has been performed the tube should be passed only three-quarters of the usual distance, for, if it is inserted full length there is always danger of traumatizing the suture line

SUMMARY

Tube passage without lavage has certain definite advantages in gastric dilatation and high intestinal obstruction

1 It is more efficaçious

2 Less cumbersome in preparation and accomplishment

3 Less discomfort to the patient

4 The danger of aspiration pneumonia is decreased

5 Tube passage can be used at very frequent intervals

This simple change in our postoperative treatment of gastric dilatation has strikingly proven its effectiveness and we should like to recommend its more extensive use in such

OXYGEN THERAPY IN PNEUMONIA*

By JAMES R SCOTT, MD, and JOHN STAIGE DAVIS, JR, MD, NEW YORK, N Y

NCOURAGED by the results of Oxygen Therapy in pneumonia secured by Binger and with their improved apand Barach paratus, we have been using it at St Luke's Hospital during the past four months with grat-The apparatus employed has been ifying results the head tent recently introduced by Barach 3 This enables the patient to live comfortably in an atmosphere in which the percentage of oxygen can be maintained at any desired concentration By this means the physician can vary the dosage of oxygen as with any other drug

In this series, oxygen was maintained at a concentration of 40 per cent, or twice that of the

*From the Medical Service of Dr Lewis F Frissell, at St Luke's Hospital, New York City

oxygen in the atmosphere at sea level. The temperature in the tent varied between 65 and 70 degrees Farenheit

The emphasis in this study was placed only on the clinical aspect of oxygen therapy No laboratory work was employed other than the routine as applied to pneumonia patients in our wards The patients were placed in the tent for continuous periods varying from a few hours to six

With but one oxygen apparatus available, it was necessary to restrict its use to those most in need of it Accordingly the patients selected were the desperately ill ones with an exceedingly poor prognosis In each instance cyanosis was present before the oxygen therapy was begun Fourteen patients were treated, of which five died, a death rate of 35 per cent A synopsis of each case follows

Case 1 E C, an American housewife, aged sixty-four, was admitted to the hospital on the seventh day of March, 1927, complaining of pain in the chest, blood tinged sputum and fever. It was the fourth day of the disease The physical examination showed an acutely ill woman whose respirations were shallow, rapid and labored The right lower and middle lobes and the upper left lobe of the lungs were consolidated cocytes were 11,800, the polynuclear neutrophiles were 78 per cent and the lymphocytes were 22 per cent The pulse was 130, the temperature 104 degrees, the respirations 30 per minuute On the sixth day because of increasing cyanosis and because the general condition was worse, the oxygen The cyanosis disappeared altent was started most immediately, the patient said she felt better The patient remained in the tent for twenty-four hours and was removed several times during this Each time she was returned to the tent the cyanosis was relieved. The patient was discharged as cured

M J, a Canadian nurse of forty-Case 2 three years, was admitted to the hospital on the fifth day of the disease She complained of pain, cough, chills and fever A physical examination showed an acutely ill woman who was markedly cyanotic and dyspnoeic. The pulse was 150, the temperature was 105 degrees and the respirations were 26 per minute The blood culture was positive, for pneumococcus type IV The leucocytes were 12,000, the polynuclear neutrophiles were 80 per cent, the lymphocytes were 20 per cent There were signs of consolidation of the entire left lung. The patient was placed in the tent and immediate relief was noted with a disappearance of the cyanosis The oxygen was continued at irregular intervals (eight hours on and eight hours off) for five days Each time the tent was replaced the cyanosis disappeared and there was relief of dyspnoea There were no changes in the pulse or temperature On the eleventh day of the disease the temperature rose to 107 degrees and the patient died

Case 3 G G, an English newsdealer of forty-five years of age was admitted on the second day of his disease. He complained of cough and pains in his chest. The physical examination showed an acutely ill man who was very cyanotic. There were signs of consolidation at the right base. A diagnosis of bronchopneumonia was made. The temperature was 104 degrees. The pulse was 100 and the respiratory rate was 32 per minute. The leucocytes were 16,200, the polynuclear neutrophiles were 84 per cent and the lymphocytes were 16 per cent. The tent was applied and the cyanosis disappeared and the dyspnoea was relieved almost immediately. There were no

changes in pulse or respiratory rate. The patient was removed from the tent three and a half hours later. The recovery was uneventful

E D, an American porter, thirty-two years of age, was admitted on the tenth day of his disease. He complained of chills, fever and pain in the chest The physical examination revealed an acutely ill man whose respirations were rapid and whose face was flushed. There was consolidation of the entire left lung and of the right middle and lower lobes. On examination of the heart it was found he also had mitral stenosis and insufficiency There was no cyano-The pulse was 128, the temperature was 105 4 degrees and the respiratory rate was 40 per The leucocytes were 25,400, the polynuclear neutrophiles were 93 per cent and the lymphocytes were 7 per cent. The pneumonia was a group IV. Two hours after admission the patient became cyanotic and the oxygen tent was started A series of pulse and respiratory readings for four hours following the administration of oxygen were as follows

9 P M		Pulse	124	Respirations	42
10 "	•	"	108	• "	44
11 "		"	120	"	40
12 M		"	122	"	40

The cyanosis cleared and breathing became easier. The patient said he felt better. On the second day the temperature fell to 102 degrees and the patient appeared to be recovering. On the third day the temperature reached 106 degrees and the patient died. The tent was applied for sixty hours.

Case 5 H S, a schoolboy of eight years was admitted to the hospital with a diagnosis of acute rheumatic fever, mitral stenosis and regurgitation, aortic regurgitation and bronchopneumonia. It was the seventeenth day of his acute disease. The patient was cyanotic and dysphoeic and complained of pain in his joints. The leucocytes were 13,000, the polynuclear neutrophiles were 86 per cent and the lymphocytes were 14 per cent. His pulse was 160, the temperature was 103 degrees and the respiratory rate was 40 per minute. The tent was applied and the cyanosis disappeared, but there was no change in the pulse, respiration or temperature and the child died five hours later. The tent was applied for five hours.

Case 6 R M, an Irish sailor of sixty-seven years of age was admitted to the hospital on the fourth day of his disease, with a diagnosis of lobar pneumonia. He complained of fever, cough and chills. The physical examination revealed an acutely ill and emaciated man who was very cyanotic. There was a complete involvement of all five lobes of the lungs. The blood culture was positive for pneumococcus type IV. The leucocytes were 7,800, polynuclear neutrophiles were 90 per cent and the lymphocytes were 10 per cent. The urea nitrogen of the blood was 28.8.

nulograms per 100 cubic centimeters of blood. The temperature was 102 4 degrees, the pulse was 140 and the respirations were 36 per minute. The patient was irrational. The oxygen tent was started at eight P.M. The cyanosis cleared and the patient seemed brighter but became very restless. At eleven P.M. the patient became rational At eleven-fifty-five the patient died suddenly.

H H, an American carpenter of forty-eight years was admitted on the ninth day of his disease, complaining of cough, chills, fever and pain in his chest There was consolidation of the left upper and lower lobes The blood culture was positive for pneumococcus type II The respirations were shallow. The patient was very The pulse was 130, the cyanotic and irrational temperature 102 degrees and the respiratory rate was 40 per minute. The leucocytes were 27,600, the polynuclear neutrophiles were 94 per cent and the lymphocytes 6 per cent Six hours after the patient was placed in the tent the pulse was 130, the respirations were 34 per minute change was noted in his condition except clearing The patient died twenty-four of the cyanosis hours later

L M, an English housewife, thirty-Case 8 two years of age, was admitted to the hospital eight hours after she had taken one hundred grains of medinal The patient was comatos, very cyanotic, moist rales could be heard throughout both lungs and at the right base crepitant rales The leucocytes were 13,600, could be heard polynuclear neutrophiles were 82 per cent and the lymphocytes were 18 per cent The temperature was 102 6 degrees, the pulse was 120, and the respirations were 40 per minute. The spectroscopic examination of the blood was normal An X-Ray of the chest showed an extensive bronchopneumonia involving the right middle and lower lobes One hour after the oxygen tent was started the pulse was 120, and the respirations were 36 per Seven hours later the temperature was 102 degrees, the pulse 86, and the respirations 30 The cyanosis had disappeared One hour later the patient was conscious and there was no cyano-The oxygen was discontinued The recovery was uneventful The oxygen was administered for eight hours

Case 9 L C, an American housewife, fiftyseven years of age, was admitted to the hospital on the 20th of March, 1927, complaining of pain in the right chest on breathing. She had had this pain for three weeks, during which time she had had fever and had tost ten pounds There was tenderness in the region of the tenth dorsal spine An X-ray of the chest was normal The blood count on admission was hemoglobin, 65 per cent, red blood cells, 3,000,000, leucocytes, 3,400. polynuclear neutrophiles, 20 per cent, and lymphocytes were 80 per cent The temperature was 102 degrees, the pulses 98 and the respirations were 24 per minute. The condition was

thought to be an aleukemic leukemia. Four days after admission the temperature reached 104 de The pain in the chest and cough seemed worse The physical signs and X-Ray revealed a bronchopneumonia The leucocytes were 2,800, the polynuclear neutrophiles were 10 per cent, and the lymphocytes were 90 per cent. Three days later she became cyanotic and irrational temperature was 104 degrees, the pulse 116 and the respirations were 30 per minute. The tent One hour later the pulse was 90, was applied and the respirations were 28 per minute. The patient was more comfortable and the cyanosis had disappeared Three hours later the tempera ture was 102 degrees, the pulse was 120, and the respirations were 32 per minute. During the following two days it seemed certain that the patient would die, the pulse was weak, rapid and irregular, the patient was irrational and incon-The hemoglobin was 52 per cent, the red blood cells were 2,400,000 A blood transfusion of 500 cubic centimeters was given count on the following day was hemoglobin, 59 per cent, the red blood cells, 2,100,000, the leucocytes were 1,200, the polynuclear neutrophiles were 20 per cent, and the lymphocytes were 80 per cent. On the sixth day of the oxygen administration another blood transfusion was given and the oxygen discontinued at this time because the improvement was so marked The tempera ture was 101 degrees, the pulse was 98 and the respirations were 26 per minute The cyanosis had disappeared and the patient was rational The patient believes that had she not had the oxygen she would have died When the tent was removed to change the ice or soda lime, she would ask to have it returned The pulse, temperature and respiratory rate varied from time to time, but the general trend was downward as indicated by the following table

Before the tent was applied T 104 R 120 R 28 Second day 110 104 32 Third 1110 - 103 28 " Fourth 98 102 28 " Fifth 98 101 26 Sixth 98 101

The oxygen was administered for six days The patient is recovering

Case 10 M C, an Italian student cert fifteen years was admitted to the hospital on thise fourth day of his acute disease, complaining of iservere precordial pain. The diagnosis of bronchoj woneumonia, fibrinous pericarditis, bilateral pleurar al effusion, mitral stenosis and insufficiency to were made. The pulse was of poor quality and rap of the disease the dyspnoea de, it creased and the cyanosis became marked. The mixture was 1036 degrees, the pulse was 13 yere and the respirations were 40 per minute. The porpneumococcus was type IV. The leucocytes were neutrophiles were 73 per 19,000, the polynuclear neutrophiles were 73 per 19.000,

cent and the large mononuclear lymphocytes were 6 per cent and the small lymphocytes were 22 per One-half hour after the oxygen had been started the cyanosis had disappeared and the patient seemed much relieved. The pulse was 122 and the respirations were 34 per minute Four hours later the patient became excited and re-The tent was removed and the jected the tent cyanosis reappeared almost immediately, the tent was re-administered and the cyanosis again dis-Three days later the pulse was 100, appeared the respirations were 28 per minute Six days later the temperature was 99 degrees, the pulse was 100 and the respirations were 26 per minute The tent was removed The recovery was uneventful The oxygen was applied for six days

J H, an American sexton of Case 11 seventy-three years who was admitted to the hospital on the fourth day of his disease, complaining of pain in his chest, cough, chills and fever The physical examination showed him to be a poorly developed man, actually ill, very cyanotic and whose pulse was of poor quality The respiratory movements were shallow and rapid signs were those of a bronchopneumonia temperature was 104 degrees, the pulse 80 and the respirations 22 per minute. The leucocytes were 5,000, the polynuclear neutrophiles were 80 per cent and the lymphocytes were 20 per cent. The oxygen tent was applied and almost immediately the patient improved The cyanosis disappeared and the patient said he felt more comfortable and could breath with more ease When the tent was removed for fifteen minutes to change the tank, the patient became cyanotic.

Before the tent was applied	T 104 P	80	R	22
Three hours after	101 2			22
Two days later	102	80		22
Third day	100	70		22

On the third day the patient was so much improved that the tent was removed. The recovery was uneventful. The tent was applied for three days.

Case 12 M E, an American clerk of thirty five years who was admitted to the hospital on the sixth day of her disease, complaining of pain in her chest, chills The physical examination showed an acutely ill woman who was dysphoeic There was a pleural rub involving the entire right lung and lower left lobe

White blood cells were 16,200, polynuclear neutrophiles were 81 per cent, lymphocytes were 19 per cent. Urea nitrogen was 33 4 mg per 100 cubic centimeters of blood. Urine Faint trace of albumin and occasional hyaline cast. The patient was very cyanotic. The temperature was 103 4 degrees, the pulse 118 and the respirations 26 per minute. When the oxygen tent was applied the cyanosis disappeared and the patient said that she felt better. One hour later the pulse rate was 120 and the respirations were 24 per

minute Twelve hours later the temperature was 100 degrees, the pulse 90 and the respirations were 26 per minute. The oxygen was stopped. The patient was in the tent for twenty-four hours. The recovery was uneventful.

Case 13 L S, a Russian housewife of fortyone years who was admitted to the hospital on the 7th day of her acute disease The diagnosis of myocarditis, pulmonary edema, mitral insufficiency and bronchopneumonia were made. The patient was dyspnoeic, orthopnoic and extremely cyanotic She complained of a cough The temperature was 100 degrees, the pulse 86 and the respirations were 24 per minute White blood cells were 5,000, polynuclear neutrophiles were 77 per cent and lymphocytes were 22 per cent Moist rales were heard throughout both lungs and subcriptant rales through the precardial area cyanosis disappeared almost immediately after the oxygen was started One hour later the temperature was 100 degrees the pulse 90 and the respirations 22 per minute Twenty-four hours later the temperature was 99.2 degrees, the pulse 80 and the respirations were 30 per minute. Fortyeight hours later the patient was removed from the tent while the oxygen tanks were being Five minutes after the tent was rechanged moved the patient became cyanotic, the pulse irregular and weak Death seemed almost certain When the oxygen was restored the patient immediately improved Twenty-seven hours later the patient was so much improved that the tent was removed The temperature was 99 degrees, the pulse 88 and the respirations were 24 per minute The oxygen was administered for five days during which time it was removed at irregular intervals for short periods. The patient had an uneventful recovery

Case 14 J R., a Spanish boy of nineteen years of age who was admitted on the 6th day of his disease, complaining of pain in his chest There was consolidation of the right middle and lower lobes and there was some involvement of the left lower lobe The patient was very cyanotic and the temperature was 103 degrees, the pulse 126 and the respirations were 26 per minute. The pneumococcus was a group IV After the tent -was applied the patient seemed more comfortable and the cyanosis disappeared At the end of one hour the pulse was 120 and the respirations were 32 per minute On two occasions the tent was removed for a few minutes and the cyanosis quickly returned The tent was re-applied and the cyanosis disappeared and breathing was less labored On one occasion when the tent was temporarily out of order, the oxygen was given by the nasal catheter without relief The oxygen was administered for four days. The patient was discharged as cured

RESULTS

It will be noted that the cyanosis disappeared

in all the patients who were placed in the tent This improvement occurred within a few minutes after beginning oxygen therapy, and persisted as long as it was continued In all m~ stances, if the patient were removed from the tent before definite clinical improvement had begun, the cyanosis reappeared and in most cases he would beg to be replaced in the tent With 43 per cent of the patients an improvement in the rate of pulse and respirations occurred on beginning oxygen therapy In almost all, the quality of the pulse was improved Seven per cent showed an increase in pulse and respiratory rate, and the remainder, or 50 per cent, were unaffected

The outstanding feature of the treatment was the immediate disappearance of the cyanosis. This was prompt and complete with each patient Coincident with this was an improvement in the appearance and subjective symptoms of the patient. To watch a dyspnosic, cyanotic patient grow rosy and comparatively comfortable in the tent was a most gratifying experience to doctor and patient alike.

When it is realized how distressing and even dangerous the symptom of anoxaemia can become, as observed in mountain sickness, it is evident that the relief of this symptom alone removes a tremendous burden from the already toxic pneumonia patient

The value of oxygen therapy is therefore due to the removal of the distressing and usually dangerous symptom of anoxaemia accompanying temporary functional failure of the lungs. If this symptom can be relieved long enough to tide the patient over the critical period, it may become a

life saving procedure We feel that this was accomplished in the patients who recovered

While the death rate in this series was higher than that for pneumonia in New York City, it was low for the type of case selected for treatment. Judging by the usual clinical criteria, they were all desperately ill patients with exceedingly poor chances for recovery. The surprising fact was not that so many should recover but that any of them should get well at all

Conclusions

- 1 The Barach apparatus enables the physician to administer oxygen at any therapeutically beneficial concentration for any length of time.
- 2 In this series the patients were placed in an atmosphere containing forty per cent oxygen and kept there continuously for periods varying from three hours to six days
- 3 Oxygen Therapy in pneumonia is symptomatic treatment directed toward relieving the anoxaemia
- 4 In this series of fourteen patients the relief was prompt in all instances
- 5 The evidence deduced from this study convinces us that with desperately ill pneumonia patients having cyanosis, oxygen therapy may be a life saving measure

THE TRANSFORMATION OF ANATOMICAL FACTORS OF SAFETY INTO ELE-MENTS OF PERIL

By DOUGLAS SYMMERS, MD, NEW YORK, N Y

IN engineering, the term "factors of safety," is used to designate the margin required in the building of engines, bridges and the like to meet any contingency which might arise in the form of unexpected stress or strain In 1907, the late Samuel J Meltzer introduced the term into medical literature in his enunciation of the doctrine that the human body is constructed with special consideration for the greatest degree of safety rather than for that of the greatest economy-that Nature is prodigal almost to the point of waste in providing factors of safety for practically every tissue in the body-anatomical, functional, nutritional, and otherwise In physiological conditions, these factors of safety justify the appellation by which they are known There are circumstances, however, in which anatomical factors of safety may be converted into hazards

which threaten the welfare of the cell community
—circumstances in which factors of safety are resolved into elements of peril by a process so
subtle that the body is apprised of danger only
when salvage is impossible

It has long been known that one kidney may be removed if the other is normal and that the amount and composition of the urine under the changed regime remain practically unaltered. This indicates, of course, that the kidney has an amount of tissue which is sufficient at a moment's notice to take on at least twice the total of work to which it is ordinarily accustomed. In the same way, experiment reveals that at least two-thirds of the available kidney tissue in the body may be removed without detriment to function. In both instances, it is the glomerulus with its tubular extension which constitutes the factor of

It is estimated that the human kidney contains two million glomeruli and, according to the experiments of Richards, the circulation of blood through them varies in such fashion that not all receive the same amount at the same time and, therefore, do not function simultaneously This finding is in accord with Korgh's demonstration that, when a muscle is at rest, many of its capillaries are temporarily empty, whereas in periods of activity the total number of bloodcarrying channels is greatly increased After experimental removal of one kidney, the remaining organ almost immediately enlarges and in a comparatively short space of time increases greatly In neither instance are the anatomical factors of safety numerically increased eration of glomeruli is unknown and regeneration of tubules, although sometimes attempted, is invariably abortive. In the compensating kidney, the glomeruli enlarge, sometimes in such manner as to stretch their limiting membrane, and the tubules increase their calibre. The glomerulus is then in a position to receive a larger supply of blood and the tubule is prepared to accommodate any reasonable increase in the output of fluid In certain conditions of disease, the glomeruli, by thousands, are partially or completely replaced by overgrowth of the epithelium of Bowman's capsule, or by fibrous tissue or amyloid deposits Many of the remaining glomeruli enlarge and, within limits, compensate for those which have been injured or destroyed Beyond these limits, compensation fails and the patient begins to show signs of renal disturbances of a sort to indicate that anatomical factors of safety have been disposed of in numbers sufficient to damage the organ beyond hope of adequate substitution-insidiously and without warning, factors of safety have been converted into elements of peril

There are reasons for believing that the animal body is provided with at least twice as much lung tissue as is necessary for purposes of ventilation and elimination Experiment has shown, for example, that compression of one lung may occur without serious embarrassment as far as ventilation of its companion is concerned rabbits, an entire lung may be removed without lasting ill effects, the animals appearing perfectly normal, sometimes as long as a year after the operation In the human body, extensive disease of the lungs with luxuriant replacement of air vesicles can occur without symptoms referable to the function of respiration A further element of safety consists in the fact that the thorax provides space in which the lungs may expand beyond their normal capacity, as best exemplified, perhaps by vesicular emphysema That the anatomical factors of safety in the lung and pleural cavities may undergo transformation to such an extent as to constitute a menace is shown by postmortem findings One of the most striking of these is to be found in the presence of tumors and tumor-like growths springing from the thymic remains, the growths so trespassing as to bring about infiltration and thickening of the pleura, invasion of the pericardium, and extensive replacement of the heart muscle, compression of one or both lungs, and displacement of such mobile structures as the trachea and œsophagus, without subjective manifestations attributable to abnormal pressure within the thoracic cavity the same way, there are innumerable examples of massive metastatic tumor deposits in the lungs without the slightest indication during life of disturbances of function referable to their presence It is obvious, therefore, that anatomical factors of safety resident within the thoracic cavity are capable of neutralizing abnormal pressure effects over a great period of time, provided the encroachment is gradual This wonderful adaptation to predatory invasion, while intended, no doubt, as a beneficent measure, is perilous in the sense that it progresses stealthily and the patient is suddenly aroused from a feeling of composure to find himself in the embrace of advanced

That the suprarenal capsules are essential to life is shown by the fact that their removal brings about death of the animal within a few hours under conditions of low blood pressure and extreme muscular weakness But the removal must be complete, if one-tenth of the total volume of suprarenal tissue is left in the body, the animal survives in apparent health. That the suprarenal capsules possess a marvelous adaptability to changed conditions is likewise shown by the fact that in 5,600 consecutive autopsies at Bellevue Hospital, bilateral destructive lesions were encountered 48 times, most of them tuberculous In 18 cases both organs were completely or apparently completely destroyed, and in not one of this number was pigmentation of the skin or of the mucous membranes observed at autopsy, nor any other sign of Addison's disease findings suggest two possibilities first that the suprarenal capsules are not completely destroyed but that residual tissue is preserved in quantities sufficient to protect or, second, that the extracapsular chromaffine tissues take on the function of those cells which have been destroyed in the medulla of the suprarenal capsule - In this connection, it is to be recalled that the suprarenal capsule represents developmentally two separate organs which, in higher forms, are fused, the cortex originating in the mesoderm and the me-The cortex is of dulla in the neuroectoderm companion origin with the testicle in the male and the ovary in the female and seems to be connected with the development of certain sexual character-The medulla, on the contrary, is composed largely of polymorphous cells which when treated with chrome salts, assume a brownish appearance and are known as chromaffine cells cells are encountered in some profusion in situations beyond the suprarenal capsule, notably in the tissues along the course of the abdominal aorta

—the so-called Zuckerhandl's paraganglia specific function of the suprarenal and other chromaffine cells is to furnish an internal secretion which maintains blood pressure and muscle tone Interference with the function of the chromaffine system, particularly with those elements which reside in the suprarenal capsule, is followed by changes of profound importance, notably by Addison's disease, which is characterized by pigmentation of the skin and certain mucous membranes and by asthenia of the skeletal and cardiac muscles As pointed out, however, bilateral destruction of the suprarenal capsules alone is not sufficient to bring about these changes A second factor is necessary and is to be sought in simultaneous destruction of both of the underlying cœliac ganglia The interpretation of these findings in Addison's disease is borne out by those in acanthosis nigricans—a condition attended, among other things, by widespread pigmentation of the skin and by pigmented verrucosities or macules In 35 cases collected by Pollitzer, 21, or 60 per cent, were investigated at necropsy, and in all of them malignant growths were found in the abdomen In six additional cases, there was presumptive evidence of malignant growths in the abdomen, but confirmation by necropsy was not obtained Pollitzer subscribes to the theory promulgated by Darier that the pigmentary changes in acanthosis nigricans are due to interference with the function of the abdominal sympathetic system brought about by pressure from malignant growths Thus, it seems that the chromaffine system, through the medium of its numerous and powerful factors of safety is able to maintain blood pressure and muscle tone even after it has been deprived of one of its most redoubtable components in the form of both suprarenal capsules, but that a further factor must be excluded in order to complete the picture of Addison's disease, namely, interference with the control exerted by the cœliac ganglia

The liver with its numerous and complex functions is able to carry on after great numbers of its cells have been destroyed. In rabbits, it has been shown experimentally that three-fourths of the entire organ may be removed, not only without detriment to function, but with subsequent cell regeneration and restoration of the organ to its normal volume. In alcoholic subjects, it is a matter of common histological observation that the liver may show intracellular deposits of fat to such an extent as to occasion surprise that it should function at all Much the same is to be said of amyloid precipitates, which may occur in such quantities that scarcely a normal liver cell is discernible, vast numbers being mechanically forced out of existence by the foreign infiltrate, while those that remain exhibit varying degrees of In man, the chief factor of pressure atrophy safety in the liver consists in the superabundance of cells with which he commences life These, as

indicated, may be replaced later to an extraordinary measure without obvious detriment to the welfare of the host. After a certain limit has been trespassed, however, the body is defenceless since, in man, regeneration of liver tissue, although sometimes attempted, never attains proportions which are even remotely commensurate with the degree of destruction

The pancreas is likewise provided with a superabundance of mature cells and on them its safety depends, since regeneration of pancreatic tissue, in man at least, does not occur. It has been shown experimentally that ligation of the main duct of the pancreas in dogs is followed in time by atrophy and connective tissue replace ment of the parenchyma, while many of the isl ands of Langerhans remain imbedded in the scar tissue, apparently in a perfect state of preservation, since the animal presents no indications of interference with carbohydrate metabolism however, the scar tissue be completely removed, diabetes develops promptly, just as it does when the normal pancreas is excised in its entirety. In both circumstances, however, the total fund of insular tissue must be eliminated, one-tenth the volume of normal pancreas, if left in the body, is sufficient to protect. In man, one occasionally encounters connective tissue replacement of the pancreas in proportions comparable to those just described, similarly attended by preservation of the islands of Langerhans in numbers sufficient to maintain carbohydrate combustion case recently investigated by autopsy at Bellevue Hospital, the pancreatic duct was so effectually blocked by a calculus as closely to reproduce the conditions following experimental Related anatomical conditions not infrequently obtain in the pancreas in congenital syphilis and in tumors, likewise with preservation of insular tissue and apparent continuation of carbohydrate metabolism It appears, therefore, that Nature has endowed these highly specialized cell collections with a margin of safety represented by the ability to subsist and to function even though their environment be changed to an almost incredible degree It nevertheless happens that the overgrowth of connective tissue is capable sooner or later of replacing islands to such an extent as to exhaust the margin of safety and precipitate disturbances in carbohydrate metabolism

It is not surprising that Nature has surrounded the great motor mechanism of the circulation, the heart, with many factors of safety. Important among these, from the anatomical standpoint, are factors which are resident in both the endocardium and muscle tissue. In the endocardium, the valves, notably the aortic and pulmonary cusps, are provided with an amount of tissue which is in excess of that needed at any one time. Thus on both sides of the aortic and pulmonary valves above the line of closure is a similurar sheet of

endocardium which is almost precisely the same size as the endocardium of the valve lying below the line of closure, so that the valves are provided with about twice as much tissue as is needed to prevent leakage. When certain disease processes attack the valve along and below the line of closure, causing retraction, the endocardium above the line of closure is automatically drawn down to take the place of the retracted part. This mechanism makes it possible for heart valves thus fortified to undergo extensive sclerotic changes and still maintain their functional integrity. Here, again, however, a time comes when the process of retraction assumes the ascendency and at that moment the valve becomes incompetent.

The anatomical factors of safety inherent in the heart muscle are equally astonishing from the standpoint of adaptat on to changed conditions Thus, not every individual dies from spontaneous rupture of the heart who suffers infarction of the heart muscle as a result of arterio-sclerotic changes in the coronary vessels On the contrary, the infarcted area is apt to become replaced by fibrous tissue and, as times goes on, this inelastic wall, under the influence of pressure from the blood within, distends to form the so-called cardiac aneurysm, replacing the heart muscle over an expanse which is sometimes of astonishing dimensions And yet life is prolonged in apparent comfort for an indefinite period So, too, the phenomenal adaptability of the heart muscle to replacement by scar tissue, invasion of tumors, and the like, is illustrated by the lesions of chronic interstitial myocarditis and by certain intrathoracic growths, notably the lymphosarcomata, which display a tendency to penetrate the pericardium and to invade the heart muscle In a case that came under my observation, replacement of both ventricles occurred to an extent that one marveled that the heart could contract at all In the heart muscle as well as in the endocardium, therefore, Nature furnishes elastic factors of safety, but these are sooner or later exhausted and the heart then begins to show signs of surrender

Perhaps the most marvelous individual factor of safety, however, is the ability of the living body to repair itself This faculty is ordinarily dormant and becomes active in response to demands which necessitate restitution of cells due to fortuitous injury or to loss occurring in the trend of normal events In physiological circumstances those tissues which are lowest in the functional scale reproduce the most readily and, as the scale is ascended and function becomes more complex, the ability to regenerate becomes less conspicuous When a tissue reaches functional perfection, as exhibited by the highly specialized ganglion cells physiological reproduction does not occur In the human body certain cells are set apart for purposes of regeneration, necessitated by natural attrition, notably those of the lowermost layers of

the skin, the germinal follicles in the lymph nodes, and the hemopoietic bone-marrow As long as growth control is under proper restraint, these cells reproduce and differentiate, function, and are discarded But the process of reproduction constitutes a potential menace in that cells are often manufactured in excess of those needed to meet reparative requirements Weigert advanced the view that physiological structure and function depend on equilibrium maintained by the mutual restraint of cells and that destruction of a cell or group of cells releases restraint to an extent sufficient to disturb the equilibrium of those which remain, in this way permitting them to indulge in abnormal proliferative activities and to produce new cells in excess of those required to offset the According to this view, hyperplasia is not a direct but an indirect result of irritation, the irritant serving to destroy cells and not to stimulate those that remain in the direction of regenera-The doctrine of regenerative over-production of cells, to which, incidentally, there are many exceptions, finds a corollary in the process of paralytic and degenerative hypersecretion, as exemplified experimentally by section of the cauda tympani nerve, that results in focal changes in the nuclei of the cells of the submaxillary gland, followed by hypersecretion of saliva Even in physiological conditions the process of degenerative hypersecretion is sometimes to be observed, the over-production of milk by the lactating breast being accompanied by retrogressive changes in the cells of the galactiferous tubules In certain tissues, not only is the supply of new cells in excess of the number needed, but the new cells constitute a menace, since they approach a type of architecture in which equilibrium between structure and function is held to be unstable, and growth may progress beyond control, a tumor resulting The principle of cell overproduction applies with force to the lymphoid tissues, among which excessive regeneration occurs in a variety of circumstances For example, there is a form of tuberculous lymphadenopathy consisting of diffuse hyperplasia of lymphoid cells without the formation of tubercles, the establishment of the nature of the process depending on the experimental reproduction of tuberculosis in susceptible animals following the injection of emulsified tissues It is not a long cry from this comparatively simple form of hyperplasia to the more highly dangerous variety encountered in the lymph nodes in chronic lymphatic leukemia pseudo-leukemia lympho-sarcoma, and related lesions It is apparent, therefore, that, in reacting to injury as well as in responding to physiological demands, Nature is sometimes extravagant, not only of cells, but of secretions as Concrete examples could be multiplied, but sufficient has been brought forward, I believe, to emphasize again that the body, in utilizing anatomical factors of safety, may find itself the victim of its own ingenious devices

SUMMARY

There is evidence that the tissues of the animal body, almost without exception, are provided with factors of safety of different sorts, anatomical, functional, nutritional and otherwise Utilization of these several factors of safety, particularly those based on an anatomical foundation,

may be carried on over a prolonged period without noticeable ill effects, but gradually they are depleted and the body, without warning, finds itself burdened by disease whose advance has been so stealthy as to excite no suspicion of its existence

RECENT ADVANCES IN ORTHOPEDIC SURGERY

By PERCY W ROBERTS, MD, NEW YORK, N Y

OTWITHSTANDING the fact that orthopedic surgery has passed from the conservative stage of expectant treatment of diseases and deformities of the skeleton by means of braces and plaster casts to its present status of active bone and joint surgery there are still many in the profession who think of the orthopedic surgeon as a man whose life is devoted to the treatment of flat feet and the application of mechanical supports true that the pioneers of our specialty were not surgeons in the generally accepted meaning Gradually, however, men of of that term surgical instincts entered the field and there has followed a complete revision of our methods of treatment of bone and joint disabilities The progress of our specialty rests not alone upon the type of men who have entered this field but also upon the out-cropping of certain scientific fundamentals which are the product of long years of patient observation and experimentation and which have broadened our vision and stimulated our initiative these fundamentals are a better knowledge of bone and joint pathology and of the terminal result of diseases treated conservatively, an understanding of the behavior of transplants of bone, tendons and fascia, the tolerance of joints to surgical trauma and the effect of intelligent postoperative physiotherapy

To be more explicit, we have learned the fallacy of the dictum of Sir Watson Cheyne uttered in 1884 and followed for several decades thereafter that all chronic, so-called "strumous" joint disease is due to tuberculosis. We know now that syphilis, benign and malignant tumors and certain metabolic changes may produce symptoms identical with those of tuberculosis and we are constantly striving for definite diagnoses to aid us in treatment

Osteoplasty, including bone grafting, has made possible the correction of many deformities, the stabilization of abnormally lax joints and the healing of certain fractures. This art of changing the contours of bones, of inducing bone formations to serve definite mechanical function and of constructing new contacts between contiguous bones is one of the most fas-

cinating features of modern orthopedic surgery
The fact that the tendons of muscles may
be transplanted to make sound muscles assume
the function of those affected by disease has
opened a wide field for the improvement of

disabilities due to anterior poliomyelitis and cerebral irritation

The discovery that joints may be subjected to extensive surgery without impairment of their function has made possible the reconstruction of damaged articulations which would

at one time have been considered beyond relief. The intelligent use of physiotherapy has enabled us to obtain a degree of functional perfection following operations on joints and tendons which was formerly impossible.

The practical influence of these fundamentals can perhaps be better illustrated by telling you something of our routine work at the Hospital for the Ruptured and Crippled rather than by descriptions of spectacular operations When a case which in former times would have been promptly diagnosed as joint tuberculosis is admitted to my service it is carefully studied for the purpose of eliminating the possibility of syphilis, benign and malignant tumors and metabolic processes as the etiologi-If a diagnosis of tuberculosis can cal factor be established we proceed to accomplish surgically what Nature eventualy brings about after years of immobilization in casts or braces, namely, ankylosis This is recognized as the first step in the process of cure and the effect of surgical intervention is to establish conditions which permit Nature to limit the progress of disease, thus preventing gross destruction of bone and consequent deformity and shortening by years the period of invalidism—an achievement well worth the operative risk will not go into the details of recent discoveries in bone pathology but will be content to say that each year brings forth new fragments of knowledge which make our generalized assumptions of the past on this subject seem pathetically puerile

The second fundamental, the behavior of bone transplants, has been responsible for many practical and not a few spectacular operations which have restored to usefulness partially wrecked human frames that formerly would have been beyond salvage. The essentials of successful bone graft operations are firm contact of freshly cut surfaces and an adequate blood supply in the host With these factors assured all sorts of ingenius ideas may be carried to fruition As a routine procedure we use the bone graft for securing ankylosis of diseased areas of the spine, for bridging gap fractures of long bones and stimulating bone growth in un-united fractures, for blocking abnormal flexion or extension of the ankle and for producing ankylosis of diseased joints Such procedures, not so long ago proclaimed as novel innovations, have become everyday routine.

The third fundamental, the behavior of transplanted tendons and fascia, finds its use chiefly in the treatment of disabilities following poliomyelitis and spastic paralysis Operations of this nature are based upon the knowledge that the tendon of a good flexor may be transplanted to make the muscle serve as an extensor which will, after re-education, function efficiently with slight loss of power due to its changed mechanical relations The value of modern methods is well shown by contrasting past and present treatment of paralysis of the lower extremity In the early days orthopedic surgeons vied with each other in designing efficient braces to enable the unfortunate paralytic to walk Today we seek to eliminate braces through surgical interference In paralysis of the quadriceps extensor, for instance, the patient cannot walk because the knee cannot be held straight to bear the body weight Frequently in such a case the biceps femoris will be unaffected We then, through a long incision extending from below the knee half way up the thigh, detach the tendon of the biceps at its insertion into the head of the fibula, reflect it upward and free the short head of the muscle from its femoral origin the tendon and muscle are carried forward at an easy angle and the end of the tendon is implanted into the patella thus converting the flevor into an extensor which has sufficient power to hold the knee extended in walking If, however, all the muscles of the thigh are paralyzed it is our custom to produce a fusion of the knee joint, thus enabling the patient to walk with the relatively slight handicap of a stiff knee In effect this is the construction of a bone brace inside the leg as a substitute for a metal brace formerly worn on the outside

Stabilization of the foot in paralytic cases is a prime necessity no matter what may be the condition of the upper part of the leg. There are many methods of achieving this. At times we find that tendon transplantation is the ideal

Again, if all the muscles of the procedure leg are paralyzed, producing a dangle foot, we find that excellent stabilization may be obtained by completely removing the astragalus and displacing the foot backward which not only establishes a firm support but enhances enormously the mechanics of locomotion in a muscleless leg In the milder cases it may be sufficient to obliterate the joint between the oscalcis and astragalus, thus preventing pronation or supination Each case is a problem unto itself but in practically all cases operations dictated by experience and judgment will permit the patient to walk without external braces

The fourth fundamental, the tolerance of ioints to surgical trauma, is well illustrated by the knee It is not so long ago, and well within the memory of most of you, that we were taught that the knee joint was the most vulnerable part of the body where infection was concerned Surgery of this articulation was avoided because of the deep-rooted fear of disastrous results from bacterial invasion and the dread of impairment of joint function if its delicate internal structures were traumatized I remember hearing John B Murphy stress the danger of even swabbing the interior of the joint during any necessary surgical procedure Today this conception of the knee joint is entirely changed The Belgian surgeon, Willems, proved during the war that even in the presence of the most virulent infection joint function could be preserved. Many a soldier has watched through long incisions either side of the patella the articular surfaces of his tibia and femur glide over each other when, under instructions from a surgeon, he voluntarily fixed and extended his leg twice a day to pump The wounds eventually healed out the pus by granulation and the knee functioned as well Since then knee joint surgery has as ever progressed apace The experienced surgeon no longer fears infection nor ankylosis and it is a common procedure in our hospital to freely open the knee joint for the removal of semilunar cartilages, loose bodies, fibro-fatty tumors or for the reconstruction of crucial liga-One of the most amazing things, in view of our previous deep respect for this joint, is the fact that the entire synovial membrane, if diseased, may be dissected out without the slightest impairment of joint function. What is true of the knee is equally true of the hip. the elbow, shoulder and ankle Indeed, during the past year extensive investigation of end results of the reduction of congenital dislocation of the hip by both closed and open methods has resulted in the conclusion that open operation produces less destructive trauma than prolonged manipulation and therefore should be the procedure of choice where one

manipulation fails to result in permanent reduction. Function is in no way affected by open operation

Likewise in old ununited fractures of the neck of the femur it is routine procedure in our hospital to open the hip joint, remove the femoral head, reshape the neck and implant it in the acetabulum. This results in a stable hip joint with a useful range of motion. How different is this from the older method of applying an indifferently efficient brace or consigning the patient to the lifelong use of crutches!

It would be imposing on the good nature of a patient audience to take up the treatment of all the disabilities which come under our care but I wish to make brief reference to sacro-iliac strain, scoliosis and painful feet

When strain of the sacro-iliac joint was popularized by the writings of Goldthwaite of Boston many years ago, the orthopedic surgeons of the day reaped something of a harvest because most of the chronic backaches which were unrelieved by salicylates or the efforts of the gynecologist were referred to the orthopedic surgeon for one of the numerous belts or braces which were heralded as the solution of these troubles - One who has had much experience with definite subluxation or arthritis of the sacro-iliac joint knows that external supports are curative in only the sim-Most of us, therefore, after a plest cases reasonable trial of conservative measures advise surgical ankylosis of the joint done by turning down the gluteal muscles and removing from the ilium a tapered block of bone corresponding to the iliac portion of the posterior arm of the articulation, then deepening this opening until it extends a quarter of an inch or more into the sacrum and completing the fusion by driving the resected block into the cavity where it eventually becomes a living osseous bridge firmly uniting the sacrum and ilium Movement of the joint having been obliterated and the ligaments having thereby been relieved of strain, pain disappears and the patient resumes his normal activities without any inconvenience whatso-There are few operations which give more spectacular results and few where prognosis is so favorable

Progress in the treatment of lateral curvature of the spine has resolved itself into surgical fusion of the vertebrae after the maximum of correction of the deformity has been obtained by the use of plaster jackets or recumbency on a convex frame. There is no subject in orthopedic surgery on which so much time and effort has been expended as that of scoliosis. Treatment based upon various theories has included exercises, corrective braces and plaster jackets. From time to time

some enthusiast has come forward with a system which appeared to show astonishing results, but all methods, when put to the test of time, left a trail of relapses when external supports were discontinued. It has therefore become rather general practice to secure what correction may be obtained by mechanical means and then to fuse the vertebrae at the point of weakness thus preventing the development of unsightly deformities which make the individual a conspicuous object of pity Obviously not every case should be immediately subjected to operation notwithstanding the fact that the girl with a mild deformity today may become a hideous hunchback in a few years Certain cases reach a state of mechanical balance and progress no further These belong to the class that are paraded as cures obtained by one system or another whereas the treatment has had little to do with the result Nevertheless every mild lateral curvature of the spine has the potentials which may produce a severe humpback and it should be under expert observation to check up the progress of the condition by means of clinical If the curve beevaminations and x-rays comes progressively worse surgical fusion of the vertebrae offers the most rational means of keeping the patient out of the ranks of the hopelessly deformed

Recalling the enormous amount of literature on disabilities of the feet it would seem as though there was nothing left to be said However, during the last year I have been interested in a simple cause of foot pain which has been almost wholly overlooked and which I want to bring to your attention as the diagnosis may readily be made by the general practitioner, and his patients complaining of painful feet may often be saved from the accumulation of an expensive and useless collection of foot plates This new idea is merely recognition of the fact that the foot, instead of having only three or four bursae as described in most works on anatomy may have as many as twenty-four divided about equally between constant sacs and adventitious formations, the inflammation of any one of which will produce disabling pain, usually ascribed to weak arches or metatarsalgia

May I suggest that when a patient comes to you complaining of painful feet you examine the troublesome members by deep palpation with the thumb for circumscribed areas of acute tenderness. These are most often found in the sole, on the medial side of the foot over the tendons of the long flexors, between the heads of the metatarsals and in the depressions anterior to and below the malleoli. Acute localized pain is more often due to bursitis than to weak arches, so-called metatarsalgia or calcaneal spurs and up to the present time the

etiology of the discomfort has gone unrecognized Surgical obliteration of the inflamed bursae will effect a complete and permanent cure

If I were to attempt to sum up the evolution of orthopedic surgery in a paragraph I know of nothing more striking than to contrast the work of the Hospital for the Ruptured and Crippled, the first institutin of its kind in this county, during the life of Doctor James Knight, its founder, and the routine of the present day Doctor Knight issued a standing order that no case of fracture and no case requiring open operation should be admitted to the hospital Last year over one thousand fractures were treated in the institution and over three thousand operations were performed

CASE REPORT OF UNDULANT FEVER⁵

By WILLIAM A. GROAT, MD, SYRACUSE, NY

THIS case of undulant fever is reported not so much because it is the first known In this vicinity, as that there must have been and are to be others This disease can so greatly vary in severity and the few cases that have been reported have been so usually of the more severe types, with high fever, drenching sweats, headache, prostration and often arthritis, that mild cases running a low fever over many weeks might be entirely overlooked A single case reported by Dr Carpenter which occurred in Ithaca is noteworthy in that the young man at no time felt sick enough to be in bed In the older days when typhoid was prevalent and laboratory diagnosis of it new and imperfect, there were many cases which were carried as typhoid but which could never be proved to be such. It was also the day of Malaria was a frequent diagnosis not well supported by evidence Possibly some cases of suspected tuberculosis with chilliness and rise of temperature toward evening followed by sweating at night, and little more showing in the chest than a bronchitis, would on close analysis prove to be infection with Brucella abortus

Malta fever has been known for many years Brucella melitensis found in the goats of that island is the known causative agent in the human disease Brucella abortus, the organism of contagious abortion in cattle, is so closely related to Brucella melitensis that it may be distinguished only by the closest bacterial study. The organisms run almost parallel morphologically, culturally and in agglutination tests. Only by the most careful observation can the differences in agglutination be shown. Brucella strains closely related to Brucella, melitensis are found in horses and swine.

The symptomatology of undulant fever due to Brucella Abortus and Malta fever due to Brucella Melitensis is the same to all in-

tents and purposes The textbook description of the latter however is of the severe types and therefore may be confusing. There is low remittent fever or fever with high temperature at night, sweating, more or less mild bronchitis, vague gastrointestinal disturbances, prostration, headache, but no rose spots or any other eruption The spleen has been found to be enlarged as also the liver but not so regularly as in typhoid The blood count is low with a gradual development of a leucopenia and relative increased percentage of lymphocytes There has been noted in the severe cases arthritis and even endocarditis. The fever tends to run for many weeks or even months, often with remissions for a considerable period or even relapses after a year or more In these long continued fevers there is of course considerable prostration and emaciation unless very well guarded against mortality is apparently quite low as practically all uncomplicated cases that have been studied have recovered The treatment is like that for typhoid, nutrition should be maintained and the fever treated symptomatically Vaccines have been used, normal immune serum has been used, mercurochrome intravenously has been used, but so far as I am able to judge from the literature none of these has definitely influenced the course of the disease

The woman whose case I wish to present is 54 years of age, married but has been married for only six years, and has never been pregnant. On the 28th of January last she felt chilly and feverish and thought she was about to have tonsillitis to which she has been subject. This failed to develop characteristically however although the sensation of feverishness and malaise continued and two days later she called her physician, Dr. Boyd, who, finding little that was definite except the fever and the malaise, a somewhat reddened throat, and some pus in the casual urine, thought there might be a pyelitis. Dr. Flaherty saw her in

A VACATION THOUGHT

This is the season of medical vacations, when every medical man, except the editor, is popularly supposed to shut up his office for a six weeks' vacation But modest doctors find their opportunities when their more popular brethren are away, and the total number of calls is fairly uniform the year round However, it is a disconcert-

ing fact scientifically that excellent doctors on duty often report no increase in their work while the popular medical leaders are away Is it possible that medical advice is often a luxury rather than a necessity? It is certainly a fact that people now have money, and are willing to spend it for the kind of advice that they desire

consultation, confirmed the fact there was nothing in the abdomen or pelvis to account for the fever, and a catheterized bladder specimen of urine was clear Typhoid fever was naturally thought of as a possibility but two examinations of the blood showed no agglutination and nothing by culture The fever retrogressed or disappeared in ten days, she was better for a week, then she felt feverish as before and again consulted Dr Boyd The same puzzling situation presented itself, the fever running to 102 or 103 at night with a morning recession after a period of sweating in the early morning, but little or no headache, no diarrhea and no digestive disturbances other than anorexia and slight epigastric distress after taking simple food She entered St Joseph's Hospital March 1st and I was asked to see her with Dr Boyd and to assume immediate charge of her while there

Physical examination showed a rather short, obese type, clear and alert, not seemingly very ill, the tonsils rather ragged and enlarged with the pillars somewhat reddened, the heart not enlarged but a slight systolic murmur at the apex transmitted into the axilla and up along the left border of the sternum, chest sprinkled with coarse rales, but no loss of resonance or limitation in excursion, the abdomen without evident lesion, the liver and spleen not palpable or demonstrably enlarged, the obesity somewhat interfering with that examination. There was no tendernes ssuggesting an abnormal kidney on either side or over the gall bladder, vaginal examination revealed nothing to account for a febrile movement Blood showed on examination hemoglobin 75 per cent, reds 4,300,000, whites 5,500, polys 42 per cent, monos, 57 per cent, eosin 1 per cent blood culture March 1st handled in the ordinary way was negative X-ray examination of chest showed some increased markings suggesting to the radiologist a bronchitis accessory nasal sinuses appeared to be clear except for some slight veiling of the left antrum which however transilluminated normally On the fourth day these investigations having revealed nothing, we thought it wise to take some blood in citrate solution for inoculation into a guinea pig and for serum to be sent to Dr Carpenter at the State Veterinary College at Ithaca for agglutination tests for the bru-While I had never suspected this cella group disease before, my interest had been aroused and I was on the lookout for it because of the work of Dr Carpenter in connection with the serological work at the College of Medicine which is nominally in my department He has been making extensive tests of the routine sera coming in for Wassermann tests in the hope of picking up some cases of Brucella Abortus infection or relating the agglutination

found to some previous unrecognized febrile condition Dr Chapman who is here tonight I have asked to say a little something about that in discussing this case The report came back, the agglutination was complete for both Brucella Abortus and Brucella Melitensis in 1-3600 dilution and partial agglutination up to 1-10,000 Since agglutination at 1-10 or 1-20 has been considered definite by the U S Public Health Service and such cases as have been reported have been agglutinating at 1-40 to 1-400 almost exclusively, we considered that complete agglutination at 1-3600 was enough for a clinical diagnosis particularly as it takes several weeks to demonstrate the organism in a guinea pig and culturing it from the blood is somewhat difficult procedure in that Brucella Abortus grows well sometimes on one media and sometimes on another in initial cultures and seems to grow best at diminished oxygen tension or 10 per cent excess of carbon dioxide Brucella Melitensis is more easily grown which may account for its earlier recognition ın human blood With the positive agglutination before us however, we have continued a careful clinical supervision of the case and find no change in the general symptomatology Blood count on March 20th was hemoglobin 75 per cent, reds 4,600,000, whites 5,400, polys 48 per cent monos 51 per cent, basos 1 per The fever has been practically continuous, ranging from 99 8 to 102 rectal and occasionally 103, sometimes only 101 Dr Chapman has started a very complete cultural study of both the blood and the urine We are reporting this case to stimulate attention to this infection, particularly when there is continued unexplained fever, for both Dr Carpenter to whom we are greatly indebted and Dr Chapman to whom we are always indebted are desirous of increasing their series of cases where they may be found

A word of caution however as to question of While raw milk from cows who have milk suffered from contagious abortion would seem to be an easy source, we do not know that this is the only source by any means, certainly the disease will run through a herd and the cows do not drink each other's milk The organism can be recovered from the urine In this particular case the woman has used raw milk and raw cream and contagious abortion is known to have been present in the herd However either humans are more or less immune or the disease is not readily contracted from drinking milk of infected cows or in the days of raw milk, we would have had an epidemic

This patient is now in the eighth week of fever with one remission, the general condition is unchanged except that for the past four days there has been some watery diarrhoea

ASSUMPTION OF MEDICAL PRIVILEGES

What do physicians think about the ethics of

the following action?

The New York Herald-Tribune of Monday, July 23, page 28, says that a certain New York doctor, whose name and address are given, made a bet of \$500 that he could drive over the streets of Ocean Grove in an automobile, in direct violation of the city ordinance forbiding autodriving on Sunday, and he accomplished the feat by telling the officer on guard at the entrance to the city that he was a surgeon and was on his way to perform an operation on a patient. The paper states that the surgeon departed by a back path and returned by way of the main entrance with two witnesses to his bet, telling the guard that he had gone in order to get some instruments which he needed

Here was deliberate deception — a doctor using

the privilege of his profession in order to violate a law for no other purpose than to win a bet Moreover, he made himself conspicuous as he drove about the city and achieved such notoriety and publicity that he broke into the last page of the New York Herald-Tribune

If the facts stated in the newspaper are true, the doctor has brought a grave reproach upon the medical profession Doctors are so careful about taking advantage of their profession that when a physician says that he is on a professional errand, he is taken at his word and is helped on his way. A physician who violates that confidence not only imposes a hardship on every honest doctor, but he also endangers human lives

Further comment on the assumption of special privileges by physicians will be found on page 948

of the daily press department

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

This Journal has always maintained the high standard of advertisements which was set forth in the following editorial in Volume 3, August, 1903

"When the State Association elected the Committee on Publication, it placed in its hands the duty of keeping its advertising columns free from objectionable and unethical advertisements. This duty the committee has endeavored to fulfill to the best of its ability, even at the cost of the Association of many hundreds of dollars, as evidenced by the following letter

"'July 25, 1903

"'Dear Doctor

"'Yours of July 3d requesting an answer from the Committee on Publication, in regard to the proposition contained in the second paragraph of your letter, which reads "I have about made up my mind not to scatter my business so much, but I will limit the number of papers I make offers to, and as I will not present any advertisements that ought not to be accepted, I will make it conditional that they are all to be taken"

"The Committee on Publication of THE NEW

YORK STATE MEDICAL JOURNAL will continue to be governed by the principles already established and by acting on each application for advertising space in all of its publications

"'The Committee requires that the quantity of the active ingredients of all internal and external

medicines be published

"'It also reserves the right to submit an edited

copy of all advertisements

"And to reject any advertisement on account

of the firm's standing

"'While the Committee would be glad to receive advertisements of the kind you are able to place in its publication, you must realize that it is impossible for the Committee to delegate its power of admitting or rejecting an advertisement to any one, however careful he may be

"'The Committee would be pleased to hear from you, and feels confident your clients cannot do better than to advertise in The New YORK STATE JOURNAL OF MEDICINE and will

well repay the advertiser

"'Very sincerely yours, "'C E DENISON'" EDITORIALS

HYGEIOLATRY, ANCIENT AND MODERN

The healing deity of the ancients was supposed to have had a dual nature. The Greeks worshiped two gods,—Esculapius, the god of the healing art, and Hygeia, the goddess of health. Esculapius was the patron god of the professional physician and surgeon. He was mysterious, austere, and learned, and could be approached only by his anointed high priest. He dealt with topics which were beyond the comprehension of ordinary people.

In contrast with Esculapius, Hygeia was a modern girl mingling with the people and dealing with every-day facts of life. She was the patron saint of the people in matters of dress, food, air, recreation, exercise, and other matters of daily life. She set the style for these matters, and required her votaries to perform daily and hourly acts of worship for the ostensible end of the preservation of health or its evidence, beauty

Esculapius had his temples, which were the pre-

cursors of modern hospitals

When the sick recovered, they were accustomed to repair to the temples and make an offering to the gods for deliverance from their ills. Furthermore, for the benefit of other persons who might be taken sick, they wrote the symptoms of their disease and the methods employed in its treatment, and posted them on the pillars of the temple in order that the physicians might study them. These votive tablets were the principal sources of the knowledge of the healing art available to Hippocrates and other ancient Greek physicians.

Hygeia maintained no temples of her own, but she was associated with the temple of Esculapius However, she was worshipped in shrines whose modern form is the clinic for well persons. Her worship was more of a cult than a serious act, and there developed a formalism in her creed and a superficiality in her ritual. She was recognized as the daughter of Esculapius, and as such she was a handmaiden in his temple rather than a healer by her own power.

A formalism in the worship of Hygeia appears in the earliest records of the human race. The Hebrews had their Book of Leviticus which is a record of formal worship, but its basis was hygiene which crops out here and there and is plainly visible to physicians who read the book with scientific minds. Formalism today is diminishing in medicine, while there is a tendency for it to increase in hygiene. The creed and ritual of the shrines of Hygeia tend to elevate the attrac-

tive goddess above the austere Esculapius Hygeia's clinics are established according to formal rules. Lectures are given according to standard outlines, and pictures are shown along conventional lines. But when serious trouble develops, the disciples of Esculapius take charge and direct the worship of its rituals, often to the dismay of the followers of Hygeia, and the subversion of their pet creeds

There will always be a popular cult of hygerolatry and a deification of cooks and dieticians, and social workers and nurses, and social leaders who serve at Hygera's shrine. There will also be Esculapian temples in the form of hospitals and medical schools and research laboratories from which will issue the knowledge of both disease and health, and high priests of medicine who will lead the people from sickness and disease to health and longevity

The shrines of Hygeia will continue to be thronged with worshipers today as they were in the days when the Greeks worshiped "The human form divine," but Hygeia cannot maintain temples today any more than she could in Greece in the time of Hippocrates Hygeia will always be in attendance in the temple of Esculapius

On the other hand the high priests of Esculapius must remember that Hygeia is the daughter of Esculapius, and that she inherits her father's abilities and aspirations While her learning may not be phenominal, yet her peculiar function is to popularize the ritual of the temple of Esculapius and interpret it to the people in their daily Possibly she may induce the Esculapian high priest to mingle with the people on terms of intimacy and equality She may bring a god of healing down from Heaven to dwell among men, and she may inspire human beings to seek and It all depends on accept his ministrations what is emphasized by the worshipers of health Hygeia is what her votaries make her She mainproperly the daughter of Esculapius tains her home in his temple and has the benefit of the service of his attendants, but she is nevertheless subject to her father, and is not a god in her own right This is the conception of the relation of Hygeia to Esculapius expressed by the House of Delegates of the Medical Society of the State of New York at its last meeting when it adopted the eight principles of action suggested by the Conference Committee on the situation in Cattaraugus County

diet of pasteurized and boiled milk with no antiscorbutic. The diet was not changed except for the addition of one tablespoonful of ripe mashed banana pap, the amount being increased daily by one teaspoonful up to one whole banana, and later to two whole bananas daily. Under this treatment there was a complete disappearance of the scurvy in about three months. At this time the r-rays revealed no pathological condition of the bones, the bone changes, however, were those of healed scurvy—Southern Medical Journal, June, 1928, xxi. 6

The Hypnotic Symptom Complex in Gynecology -O Lang of the Tubingen Gynecological Clinic refers to the symptom picture of which low blood pressure is the most striking component Although the subject has not yet been studied in genecology it is well known If a woman under 35 years of age has a systolic pressure below 95, or if one over 35 has one below 105 she may be termed The parent condition which unhypotonic derlies this hypotonia is varied—anemia, tuberculosis, circulatory insufficience many infections, endocrine anomalies, etc. The author in an analysis of 700 gynecological cases found 40 hypotonics in which no causal influence could be assigned these he terms essential hypotonics Such patients show certain analogies with the infantile asthenic, and hypoplastic constitutions Aside from hypotension the symptoms do not seem to be typical patients tire readily and are mostly underweight, due partly to indifference to food, there often being a feeling of satiety, while there are many symptoms of imperfect digestion is pallor, the patient is relaxed in attitude, and her movements are sluggish. The psyche is apt to show depressive states with hypochondriac fears Physical examination may reveal The author a drop heart with visceroptosis goes very thoroughly into the symptomatology, but is unable to throw much light on the causation The outlook is mostly unfavorable, as such women have not the stamina to become efficient wives and mothers, and improvement is always likely to be followed by relapse Not much can be done by treatment although rest in bed for a time is counselled therapy is of no benefit, dieting is also unsat-Warmth, especially in the form of diathermy, is of some value, also simple tonics Of possible Coffee and tea are well borne value and worth a trial is insulin as a stimulant to assimilation -Münchener medizinische Wochenschrift, May 11, 1928

Relief in Cardiac Insufficiency Through Extracardial Surgical Intervention—W Felix of Sauerbruch's surgical clinic contributes a brief

article on this subject which is a new one and not connected with recent efforts to operate intracardially As a result of animal experiment in association with ordinary clinical observation the author suggests several possibilities under this head. The first is simple pericardiotomy in stasis-dilatation, the result of which is to eliminate the effects of pericardial The technique is simple, for no resection is required. An incision is carried out in the fourth space, the rib retractors are applied, and the pericardium is incised in front of and parallel with the left phrenic nerve The divided edges of pericardium unite later with the wall of the heart. A second form of intervention is suggested. The right ventricle is the one which will give out first after years of valvular insufficiency In theory insufflation of air into the pericardial sac should offset the tendency to dilatation, and it is also possible to take a tuck, so to speak, in the same structure with the same expectancy, but the best of all possibilities of this kind is an artificial pneumothorax of the type styled by the author the mantle, which is done on the right It is true that the elastic lung appears to compress the auricle rather than ventricle but the result is satisfactory There is still another possibility, that of surgical relief of essential hypertension, and to secure this we go back again to pericardiotomy which has the result of lowering the blood pressure and of combating the associated symptoms does not appear that any of these interventions have as yet been deliberately carried out on the human subject —Munchener medizinische Wochenschrift, May 18, 1928

Meningitis in Childhood Due to the Koch-Weeks Bacillus - Drs Hedwig Mever and R Steinert of Mannheim refer first to the original announcement in April, 1927, by Hugo Mever of three autopsy reports in the hospital in which the findings comprised severe suppurative meningitis due apparently to an unknown organism which resembled the influenza bacillus patients with the same disease recovered cases studied the ages ranged from 2 to 18 months The clinical course differed in some respects from the type of disease set up by the meningococcus and pneumococcus There was an early febril stage with sudden onset of symptoms of meningitis, the patients remaining mostly unconscious during the entire 4 or 5 weeks of the disease The spinal punctate was cloudy and rich in pus cells and on long standing deposited a fibrinous clot The present authors took up the bacteriological study in the effort to identify the unknown cause and were able to obtain cultures of the Koch-Weeks bacillus, an organism hitherto believed to be restricted in pathogenicity to the well-known

MEDICAL PROGRESS

The Treatment of Bronchiectasis -In the management of established cases of nonobstructive bronchiectasis F G Chandler (Lancet, May 26, 1928, ccxiv, 5465) recommends long convalescence at the seaside or some warm dry place in the country, much rest, and later bathing and sunbaths or ultraviolet light Two or three times a day the patient should he with the shoulders lower than the rest of the body to encourage drainage If this regime does not suffice, diathermy applied to the affected part should be tried The creosote chamber is excellent if the patient is not too ill or debilitated Vaccines may be tried, but with great caution, their value is doubtful As an inhalant, a solution consisting of phenol and chloroform, 2 parts of each, and iodine and ether, 1 part of each, used in a Yeo's inhaler, renders the breath less offensive and may have an antiseptic action Of the drugs that may be given by mouth, creosote up to 20 or 30 minims three times a day, guaracol carbonate, specacuanha, oil of sandalwood, turpentine, garlic, or arsenic may be tried tracheal injection many substances have been used, such as menthol or menthol and guaracol More recently gomenolized oil, 1 to 5 per cent, and lipiodol have been employed, though their value is uncertain If these methors fail, some form of collapse will be indicated The simplest of these is temporary artificial pneumothorax, which often brings about great improvement, and appears to arrest the progress of the condition As a rule, however, it is insufficient and then there are two possibilities (1) converting the pneumothorax into an oleothorax, (2) collapse operations For the oleothorax, olive oil containing 5 per cent gomenol has been most frequently employed This will remain unaltered and unabsorbed for at least six months, and the discomfort to the patient is surprisingly slight. If this is unsuccessful and the disease is basal, a collapse operation is indicated Phrenic evulsion should first be considered as it is simple and an excellent preliminary to pneumolysis or thoracoplasty If the disease is well established on both sides, collapse methods are unavailing and operative procedures must not be under-When the symptoms seem to taken lightly be due to a large single cavity, rib resection and drainage may be attempted

Abdominal Pain as Exemplified in Acute Appendicitis—John Morley discusses the light which a study of acute appendicitis throws on the mechanism of abdominal pain, emphasizing

the point that the initial pain is entirely differ ent in character and in its mode of origin from the pain which appears in the right iliac foss: a few hours later The initial central pain is a true splanchnic pain, due to increased intraappendical tension, it is not referred or reflected pain, as no radiation of pain or reflex process is involved. The appendix is developmentally a part of the mid-gut, and the brain can appreciate painful stimuli arising from any portion of the mid-gut only as vaguely situated in the center of the abdomen The localized right-sided pain is due to irritation of the parietal peritoneum Mackenzie's viscerosensory reflex theory of the production of cutane-According to ous hyperalgias is untenable this hypothesis the pain is due to stimuli arising in the appendix and traveling by way of the splanchnics to the spinal cord, but if this were correct, the pain would be bilateral Morley contends that the hyperalgia is a phenomenon in which the splanchnic afferent nerves take no part, but which is due to the fact that the nerves of the excrutiatingly sensitive peritoneum affect their cutaneous branches Protective muscular rigidity is also a reflex result of peritoneal stimulation alone If Mackenzie's visceromotor reflex were a fact, the muscular rigidity produced by it would be constant in position, since it would be determined by the segmental innervation of the appendix and would be unaffected by the position of the appendix in relation to the abdominal wall With recognition of the role played by the parietal peritoneum in the production of abdominal pain, the diagnosis of acute appendicitis becomes a far simpler problem according to different observers, hyperalgesia can be detected in only 21 to 59 per cent of cases of acute appendicitis and is often observed in neurotic patients, it is of doubtful diagnostic value On the other hand, muscular rigidity and tenderness are of decided value in the early stage of appendicitis, enabling one to locate the inflamed appendix with remarkable accuracy—British Medical Journal, May 2, 1928, 1, 3516

A Case of Scurvy Cured with Banana Diet—Although it is well known that the ripe banana furnishes a source of the antiscorbutic vitamin C second only to orange juice, and is protective against scurvy, few reports have appeared in the literature showing the cure of scurvy by banana feeding L von Meysenbug describes the case of an infant, 19 months old, who developed a typical case of scurvy while on a

tonsil and strong suction applied, repeating the procedure three times. The crypts of the tonsil are thus thickly smeared with the antiseptic cream. Eve employs mercury oleate, bismuth, kerosene (for its creeping qualities), and vanishing cream. The application is made at least once a week until no more puts is found, then the interval can be lengthened to 10, 14, 21, or 28 days. Under this treatment subinfective toxic symptoms often quickly disappear. Tonsillectomy is the best cure when possible, but in adults it is practically a major operation and often out of the question. The method here described provides a desirable alternative, which is available to the general practitioner.

Albuminuric Retinitis Without Nephritis — H Marx and K. Schmidt of Romer's eye clinic in Bonn relate in great detail a case of what they term "acute Bright's disease" in which there was no nephritic component, which at first sight seems to present a paradox. The pertinent question is naturally how a diagnosis of Bright's disease could have been justified without any evidence of renal lesion The urine was free from even a trace of albumin. There were no casts or red blood cells and the specific gravity was normal But there was edema of the lids and dorsal aspects of the feet with the facial suggestion of acute Bright's disease, high blood pressure, and residual nitrogen at the upper level of the normal The diagnosis seems to have been strengthened by the results of water ingestion in conjunction with blood studies These, while too long to quote, agree with the results obtained by others in actual nephritis Thus far there seems to have been very slight justification for the diagnosis of Bright's disease, but a follow up of the case shows that after the discharge of the patient she developed casts and blood cells in the urinary sediment, albuminuria appearing at a later period But it was found that these finds were not constant but followed only upon some unusual physical exertion, so that the albuminuma was placed among the orthostatic forms At the last account the patient was entirely free from symp-The case was most instructive as suggesting that Bright's disease is in reality a general disease in which the kidneys may be involved only secondarily and indeed only temporarily at The albuminuric retinitis, in reality the principal lesion for which treatment was sought, was typical -Deutsche medizinische Wochenschrift, June 1, 1928

The Effect of Calcium, Potassium, and Sodium Salts in Cases of Delayed Healing — W L T Addison reports a study growing out of an accidental finding in which calcium chlorate was given to control secondary hemorrhage This agent not only checked the hemorrhage but the granulations, which were grayish blue in color and sloughy, within thirty-six hours be-

came bright red and more than normally abun-Following this experience, observations made in two cases of the chronic ulcer type showed that potassium chloride, in 90 grain doses daily, stimulated active phagocytosis and was efficient in bringing about tissue regeneration Potassium citrate was equally efficient when given in amounts of 180 grains daily. When the dose was reduced to 120 grains a day healing came to a standstill It was also found that 270 grains of potassium citrate produced more rapid healing than 180 grains. The administration of sodium citrate in the first case inhibited the regeneration of the tissues, while in the second case there was an actual breaking down of the granulations already formed and of well established scar tissue to form a new ulcer author concludes that it is too much to hope that the functions of the body salts in relation of degeneration and regeneration of tissues has been worked out, but the evidence seems to show that the sodium ion tends to bring about a degeneration of the vessel structures, and calcium and potassium a regeneration of these tissues -Canadian Medical Association Journal, June, 1928, xviii, 6

Neurosis of the Vegetative Nervous System -Dr A Deuber refers to a syndrome described originally by Selter in 1903 under the name of trophodermatoneurosis This discovery passed unobserved, but Swift, an Australian, rediscovered it in 1914, and in 1922 Feer of Zurich placed it permanently on the map Swift termed it "erythroedema" and Feer "neurosis of the vegetative nervous system" Others have since mentioned it under such names as "pink disease," "infantile acrodynia," etc The affection cannot be so rare because in recent years 15 cases have been seen in Basle. The 10 cases seen in the University Clinic are described at great length and are summed up as follows by Deuber affection is almost peculiar to infants and young children, begins as a catarrhal grippe infection of the respiratory tract, mostly in the winter and early spring There is added a peculiar mental state of apathy, irritability, depression, and at nights restlessness and insomnia. The mental faculties are not affected. There is total anorexia and emaciation, a peculiar poverty and slowing up of muscular movements, and a high degree of muscle flaccidity, and to these are added paresthesias of the extremities which are accompamed by characteristic lividity and swelling The patients are continuously thirsty, itch intensely all over, and there are also various intes-The very number and variety of tinal troubles the symptoms can be explained only, it seems, by an affection of the vegetative system The female sex shows a decided predisposition. The affection is now well known to the pediatrists of most countries -Schweiserische medisinische Wochenschrift, May 26, 1928

conjunctivitis known as the Koch-Weeks ever, the virulent organisms can descend into the nasal chambers and in this way the eye disease may be propagated by sneezing, coughing, etc In dead nurslings the organisms were found in the nasopharynx and middle ear, and the meningeal complication doubtless resulted through direct extension into the cranial cavity The early febrile stage which lasted several days was due to the inflammation of the nasopharynx and sphenoidal sinus cells Convulsions were present as initial manifestations and again much later in the history of the meningitis and were of the tonicoclonic type None of the patients presented conjunctivitis and there was nothing of the kind in the environment—Munchener medizimsche Wochenschrift, June 1, 1928

Phlegmonous Gastritis of Bacillus Aerogenes Capsulatus (B Welchii) Origin —The rarity of phlegmonous gastritis, and the very unusual occurrence of B aerogenes capsulatus as the probable etiological agent, led John J Morton and Samuel J Stabins to report this case An arteriosclerotic man, aged 72 years, after an operation for perforated gastric ulcer, did not recover as rapidly as is usual in these cases, and after five days, during which time he had vomited "coffee ground" material daily, his condition changed decidedly for the worse. The symptoms were those of severe toxemia shock developed, he vomited suddenly nearly 1,000 c c. of bright red fluid, and expired invasion of the stomach by the Welch bacillus was not suspected clinically At necropsy a necrotic area was found about the suture line, which was probably the portal of entry of the gas In the pathological picture of phlegmonous gastritis the process appears to be chiefly limited to the submucosa In the case under discussion the gas bubbles indicated a marked submucosal involvement but the mucosa also showed much damage The gastric tissues were invaded by large number of Welch bacilli, and in the region of the gangrenous patch there were numerous streptococci, which were probably secondary invaders It seems rather strange in view of the prevalence of the Welch bacıllus as an inhabitant of the large bowel that infection with this organism occurs so rarely Apparently the local conditions are not usually favorable for the lodgement or propagation of this organism, even in the large intestine. It has only recently been demonstrated by several investigators that under altered physiological or pathological conditions, invasion of the whole gastroenteric tract is pos-The authors have personally recovered welchu repeatedly from high jejunostomy loops in patients suffering from obstructions or ileus due to any cause -Annals of Surgery, June, 1928, 1xxxvII, 6

Seasickness and Its Treatment -Professor M H Fischer of the Physiological Institute of Prague discusses this subject in an article in the Klimsche Wochenschrift of June 3, 1928 We know that the deaf mute is almost immune from seasickness and that nausea may be provoked experimentally by stimulation of the labyrinth, but the mechanisms involved are obscure It is possible to simulate the movements due to rolling and pitching of ships in the laboratory and this the author has essayed by a special form of apparatus Certain test subjects are more sensitive than others to these movements and nausea and vomiting may be provoked. The pulse rate, blood pressure and other readings were made and the vertiginous sensations were carefully No acquired tolerance was noted in the author's experiments nor was any expected for other factors enter into the complex, such as the ability of the subject to walk about on shipboard and to get the benefit of pure fresh Various drugs were tested with a view to determine whether action on the vagus is sufficient to modify the symptoms These drugs have for the most part been tested in actual seasickness, and formulae containing combinations of the remedies are being exploited commercially, despite the fact that the leading drugs are much too powerful to entrust with the laity According to recent abstracts in the New York State JOURNAL OF MEDICINE, a combination of scopolamine and hyoscyamine has been used with much success by marine surgeons The author tested this in the proportion of 1 part of scopolamine to 4 of hyoscyamine, and found it useful in controlling the nausea The salt used was the camphorate of each alkaloid, the levo-salt being preferred

Tonsil-Suction in Diagnosis and Treatment —Frank C Eve, writing in the British Medical Journal, June 2, 1928, 1, 3517, describes a device consisting of a small glass funnel with a rubber suction ball, for the removal of pus from infected tonsils With the stem of the funnel against the angle of the mouth, the "sucker" is pressed firmly against the opposite tonsil, the suction ball is squeezed and then released, with the finger over an air-hole on the stem of the The tonsil is thus extroverted By giving the funnel a combined pull and slide toward the cheek the pus is picked off by the incurved glass edge, and can be demonstrated to the patient and examined microscopically Eve has used this method of tonsil suction for three years and estimates that in patients with fibrositis pus can be demonstrated in from 90 to 95 percent of the For therapeutic purposes the tonsil-sucker is similar to the diagnostic one, but with a wider mouth and thicker rim and without the incurved A wetted finger-stall is slipped over the funnel to form a flat diaphragm and spread with This is pressed against the antiseptic cream

Sunday 10

thereof, to be held," or "E F, justice of the supreme court," or otherwise as the case may be) "at ______ on _____" "to do and receive what shall then and there be considered, concerning the said C D And have you then there this writ

When the writ is signed, the law declares that it cannot be disobeyed for any mere defect in form 11 So jealous is our law of the personal liberty of the citizen that it declares that "Where a justice of the supreme court, in court or out of court, has evidence, in a judicial proceeding taken before him, that any person is illegally imprisoned or restrained in his liberty within the state, or where any other judge authorized by this article to grant the writs has evidence, in like manner, that any person is thus imprisoned or restrained within the county where the judge resides, he must issue a writ of habeas corpus * * * for the relief of that person, although no application therefor has been made' 12 When the prisoner is brought before the judge, it is the duty of the judge or court to examine into the causes of the prisoner's detention, and if he finds that the prisoner is illegally detained, he must discharge him from custody, and if he is legally detained, he must remand him to imprisonment "13

In the early days of England, when the courts were subservient to the Crown, where a person was arrested at the instance of the sovereign, the writ of habeas corpus was of slight avail, because the judges feared to use it. The English people's discontent with this condition lay at the bottom of the struggles between Charles I and the Parliament of England. Long before the American colonies threw off the yoke of the mother country, the writ of habeas corpus was in force, and when finally the United States constitution was adopted, there was included in that American Magna Charta this sentence "The Privilege of the Writ of Habeas Corpus shall not be sus-

pended, unless when in Cases of Rebellion or Invasion the public Safety may require it '15 Our own New York state constitution has likewise guaranteed the right of habeas corpus It has done so in these words "The privilege of the writ of habeas corpus shall not be suspended, unless when, in cases of rebellion or invasion, the public safety may require its suspension" In the constitutions of Virginia, Vermont, Louisiana and North Carolina, it is provided that the privilege of the writ shall in no case be suspended 17

In the war between the states, President Lincoln deemed it necessary to suspend the privilege of the writ without authority from Congress, although later, authority (insofar as Congress had the power to grant the same) was given him. But a limitation was placed upon this right by the Supreme Court of the United States in the great case of Exp Milligan, 4 Wall, 115. It was there held that the writ could not be suspended in any section of of the country where the courts were open and there was no actual warfare.

The writ of habeas corpus is, then, one of the great privileges of the English-speaking race. It is a bulwark of liberty, a guarantee that no one can be here deprived of his liberty without due process of law, and that when so deprived, he can immediately invoke the strong arm of the law to examine into the legality of his detention, and where such detention is illegal he must promptly be discharged from custody.

OPERATIONS FOR BUNIONS—SUPERFICIAL INFECTION

In an action against a surgeon it was charged that on April 24th the plaintiff, a woman, suffering from bunions had consulted the defendant as such physician. After examination of the pa-

tient's feet he advised her to have the big toes operated upon and he represented that he was a specialist in this type of operation. That the operation was a minor one and by the operation

THE WRIT OF HABEAS CORPUS

There is no more important guarantee of liberty to the citizen than that found in the writ of habeas corpus The writ of habeas corpus is an order of a judge directed to the person who is detaining another, and requiring that person to bring the body of the prisoner before the judge at a designated time 1 Our New York statute declares that "A person imprisoned or restrained in his liberty, within the state, for any cause or upon any pretence, is entitled, except, in one of the cases specified in the next section, to a writ of habeas corpus * * * for the purpose of inquiring into the cause of the imprisonment or restraint, and, in a case prescribed by law, of delivering him therefrom"² The exceptions referred to in the statute are where a person has been committed by virtue of a mandate issued by a court or a judge of the United States, where the Federal courts have exclusive jurisdiction, and where the prisoner has been committed by virtue of the final judgment of a competent tribunal of civil or criminal jurisdiction, "or the final order of such a tribunal made in a special proceeding instituted for any cause, except to punish him for a contempt, or by virtue of an execution or other process issued upon such a judgment, decree or final order"3

The name "habeas corpus" is derived from the Latin words originally used by the English courts when all writs were expressed in that "The date of the origin of the writ language of habeas corpus cannot be precisely ascertained It may have antedated Magna Charta, but it seems that until Magna Charta was assented to by King John (June 15, 1215), and for some time thereafter, various other writs were used for the purpose of enforcing the right of personal liberty * * * " The use of this writ, one authority has declared, became prevalent "before Magna Charta, and came to us an inheritance from the mother country, and exists as a part of the common law * * * "5 The office of this writ is to inquire into the ground upon which any person is restrained of his liberty, and when it is found that the restraint is illegal to deliver him from such illegal restraint "6

This judicial process has long been the favorite of the law. Thus our present day New York statute fixes heavy penalties against the judge himself for refusing the issuance of a writ in a proper case. A court or a judge

authorized to grant the writ, says the law, "must grant it without delay whenever a petition therefor is presented, * * * unless it appears from the petition itself or the documents annexed thereto that the petitioner is prohibited by law from prosecuting the writ For a violation of this section, a judge, or, if the application was made to a court, each member of the court who assents to the violation, forfeits to the prisoner one thousand dollars, to be recovered by an action in his name or in the name of the petitioner to his use"

In order to secure a writ of habeas corpus, there must be presented to a court or judge a verified petition that the person in whose behalf the writ is applied for is imprisoned or restrained in his liberty, the place where, unless it is unknown, and the person or officer by whom he is so imprisoned or restrained, naming both parties if their names are known, and describing either party whose name is un-The petition must set forth that the person in whose behalf the writ is applied for is not detained by any judgment, decree or final order or process of a Federal court It must set forth the cause or pretence of the imprisonment or restraint, according to the best knowledge and belief of the petitioner If the imprisonment is by virtue of a mandate, a copy of this must be annexed to the petition, unless the petitioner avers either by reason of the removal or concealment of the prisoner before the application, a demand of such a copy could not be made, or that such a demand was made, and the legal fees for the copy were tendered to the officer or other person having the prisoner in his custody, and that the copy was refused. If the imprisonment is alleged to be illegal, the petition must state in what the illegality consists 8

The form of the writ of habeas corpus is clearly set forth in our New York statute. It is as follows

"The People of the State of New York, To the Sheriff of," etc (or "to A B")

"We command you, that you have the body of G D, by you imprisoned and detained, as it is said, together with the time and cause of such imprisonment and detention, by whatsoever name the said C D is called or charged, before _____," ("the supreme court, at a special term or term of the appellate division

NEWS NOTES

JEFFERSON COUNTY

The last meeting of the Jefferson County Medical Society was held on June 15, 1928, at Clayton, N Y, following an outing held in the afternoon at the Clayton Golf Club

The meeting was held following the dinner at the Hubbard Hotel

Dr Wendell D George was elected to membership in the Society

Dr John \ Pritchard of the State Hospital for the insane gave an address on "Practical High Spots in Psychiatry"

WALTER S ATKINSON, Secretary

GREENE COUNTY

The midsummer meeting of the Greene County Medical Society held in Greenville July 10, 1928, was called to order by the President, Dr. A. O. Persons

The following answered to roll call Drs Daley, Sinclair, Rapp, Waller, A O Persons and Wasson There were present as guests of the Society, Dr James N Vander Veer of Albany, President-elect of the Medical Society of the State of New York, and Dr Huntington Williams, District State Health Officer

Dr Morris Axelrad of Tannersville, Dr Horace Baldwin, of Tannersville, and Dr Herbert Weinhauer of Windham were elected to membership

Drs Waller, Daley and Sinclair were appointed a committee to nominate officers for 1929, and to report at the October meeting

Dr James N Vander Veer, President-elect of the Medical Society of the State of New York, was then introduced and addressed the society on State Society matters, particularly in regard to various activities that the State Society very much wished the County Societies to take up, enumerating them in the following order

1st The attitude of the County Societies in regard to their relation to the State Department of Health

2nd The nursing problem, stressing the fact that there were only four counties in the State without hospital facilities, and that the State Society was urging these counties to take the initiative in establishing hospitals

3rd The committee on Public Health and Post Graduate work, suggesting that the County-Societies make application for post graduate courses for next year as early as possible

4th The Committee on Public Relations, urging the County Society to take

1st A survey of all Health Agencies in the County with their names, membership list, program, and manner of carrying on the same

2nd The collection of data concerning all types of medical activities, both curative and preventive, and whether carried on by official or unofficial agencies

3rd Confer with the Director or other agent of every organization interested in conducting or promoting curative and preventive medical activities in the County with regard to its program, for the purpose of offering assistance in the development of the medical phase of such program

4th Confer frequently with the Public Health Committee of the County Society regarding the methods employed in Public Health work throughout the County

5th Be prepared to take leadership in developing medical programs for the County agencies

Dr Rapp moved that a rising vote of thanks be given Dr Vander Veer for his enlightening and interesting address—It was seconded by Dr Daley and carried

Dr Williams, District State Health Officer was next introduced and discussed Dr Vander Veer's address, stressing the interest Dr Nichols took in organized medicine

The minutes of the meeting were then read and approved and adjournment taken to the annual meeting in October

W M RAPP, Secretary

944 LEGAL

the bunions would be reduced, the big toes assume a normal shape The complaint further stated that the patient was especially fond of walking, out of door exercise and dancing and desired to have the defect of her feet corrected, and for that purpose on the 27th of April engaged the defendant to operate upon her feet. That he did so in a negligent and careless manner, and that. although the patient repeatedly called to the defendant's attention an inflammation of the toes and complained of pain in the left foot, the surgeon failed to do anything to relieve her of her condition or to examine and treat the toe She further charges that while at the hospital where operated upon the surgeon merely glanced at her without doing anything or rendering any treatment to her to relieve the inflammation and pain of the left foot. It was further charged that the inflammation and pain continued until the 4th of May, at which time the surgeon opened the bandages and stated that on the next day she would be able to go home That thereafter the inflammation and swelling became increased, became unbearable and the surgeon continued to treat the left foot negligently and carelessly so that the inflammation and infection extended up the leg and he also refused to examine the plaintiff's feet That on the 7th of May, in fear of her life the plaintiff left the hospital and went home On the 8th of May the surgeon was called to her home, attempted to rebandage her feet in the presence of another physician, but did so negligently and carelessly, that on the 10th of May the defendant surgeon was discharged from further treatment and another physician engaged, who treated the plaintiff's left foot and advised that another operation would be necessary the 28th of May the plaintiff entered another hospital and the left foot was then operated on remained in the second hospital until the 29th of June, leaving said hospital on crutches inflammation of the left foot remaining unhealed, on July 2nd another physician attended the plaintiff, and on August 15th she entered another hospital for a further operation which was performed on August 16th She remained in the third hospital until August 22nd, again leaving this hospital on crutches and had to use crutches in walking for a long period of time charged that by reason of the defendant's negligence and improper treatment she suffered extreme pain and anguish from April 27th to the following October, had to undergo several operations and be treated by several physicians and

had to expend about \$3,500 in an attempt to be cured

On April 24th the plaintiff, a woman about 28 years of age, called on the defendant surgeon at his office and requested that he remove bunions from each of her feet That he sent her to a hospital and on the following day, under a general anaesthesia, cut away the bunions In doing so he made an incision on the inner side of the big toe with a Gigli-Hertle saw, cut off a section of metatarsal bone and then with a scissors cut off a section of the capsule and interposed it between the ends of the bones He then sutured the ends of the capsules, also sutured the skin with silk worm gut A dry gauze dressing was applied, bandage over the incision and a wooden splint placed on the foot. After operating on the left foot he proceeded to operate upon the right foot in exactly the same manner, using the same instruments and similar bandage and splint When the operation was completed the patient came out of the anaesthesia safely and was put Thereafter the surgeon called on her daily, saw that she was comfortable, but did not remove the bandages until the third day then found the right foot was doing nicely, but the left foot had a red spot at the incision opened one stitch to relieve the pressure and rebandaged both feet. He saw her daily and redressed with dry gauze her left foot up to the day that she left the hospital On the day following the day she left the hospital he called on her at her home and found her in bed He also found another physician in attendance He then removed the bandage from the left foot and took out one more stitch, redressed the foot and rebandaged it as before At this time he advised that nothing be done until he called the next day the following day he received a telephone message stating he need not call any more as another physician had been procured When last seen the woman's right foot had healed with a good result The left foot showed signs of superficial The surgeon states that his scalpel, scissors and forceps were all properly sterilized before beginning the operation and likewise the field of operation Nothing further was heard from the patient until the institution of this action

The plaintiff not proceeding with the trial of the action, a motion was made to dismiss the same for lack of prosecution, which motion was granted terminating the action in his favor

NEWS NOTES

JEFFERSON COUNTY

The last meeting of the Jefferson County Medical Society was held on June 15, 1928, at Clayton, N Y, following an outing held in the afternoon at the Clayton Golf Club

The meeting was held following the dinner at the Hubbard Hotel

Dr Wendell D George was elected to membership in the Society

Dr John \ Pritchard of the State Hospital for the insane gave an address on "Practical High Spots in Psychiatry"

WALTER S ATKINSON, Secretary

GREENE COUNTY

The midsummer meeting of the Greene County Medical Society held in Greenville July 10, 1928, was called to order by the President, Dr A O Persons

The following answered to roll call Drs Daley, Sinclair, Rapp, Waller A O Persons and Wasson There were present as guests of the Society, Dr James N Vander Veer of Albany, President-elect of the Medical Society of the State of New York, and Dr Huntington Williams, District State Health Officer

Dr Morris Axelrad of Tannersville, Dr Horace Baldwin, of Tannersville, and Dr Herbert Weinhauer of Windham were elected to membership

Drs Waller, Daley and Sinclair were appointed a committee to nominate officers for 1929, and to report at the October meeting

Dr James N Vander Veer, President-elect of the Medical Society of the State of New York, was then introduced and addressed the society on State Society matters, particularly in regard to various activities that the State Society very much wished the County Societies to take up, enumerating them in the following order

1st The attitude of the County Societies in regard to their relation to the State Department of Health

2nd The nursing problem, stressing the fact that there were only four counties in the State without hospital facilities, and that the State Society was urging these counties to take the intiative in establishing hospitals

3rd The committee on Public Health and Post Graduate work, suggesting that the County-Societies make application for post graduate courses for next year as early as possible

4th The Committee on Public Relations, urging the County Society to take

1st A survey of all Health Agencies in the County with their names, membership list, program, and manner of carrying on the same

2nd The collection of data concerning all types of medical activities, both curative and preventive, and whether carried on by official or unofficial agencies

3rd Confer with the Director or other agent of every organization interested in conducting or promoting curative and preventive medical activities in the County with regard to its program, for the purpose of offering assistance in the development of the medical phase of such program

4th Confer frequently with the Public Health Committee of the County Society regarding the methods employed in Public Health work throughout the County

5th Be prepared to take leadership in developing medical programs for the County agencies

Dr Rapp moved that a rising vote of thanks be given Dr Vander Veer for his enlightening and interesting address. It was seconded by Dr Daley and carried

Dr Williams, District State Health Officer, was next introduced and discussed Dr Vander Veer's address, stressing the interest Dr Nichols took in organized medicine

The minutes of the meeting were then read and approved and adjournment taken to the annual meeting in October

W M RAPP, Secretary

MEDICAL WARES

ELASTIC STOCKING

Varicose veins of the legs require a support which takes the place of the missing elastic elements of the veins. The ideal support does not exert pressure in order to force blood and serum from the veins and arteries, but it forms a support which prevents the veins from distending

The basis of an elastic stocking is a rubber thread somewhat smaller than the finest lead of a lead pencil. It comes in skeins like ordinary thread of cotton or wool. The quality of the finished product will depend on the quality of the rubber of which it is made. Rubber is variable in its elasticity and lasting qualities, but good rubber has a standard quality of permanence which equals that of other goods. If the manufacturer uses the best quality of rubber, the elasticity of a stocking will continue a period as long as the life of the cotton thread with which it is woven

The first process in manufacturing a stocking is that of covering the rubber string with a fine cot-The rubber is fed through a bobbin ton thread which revolves rapidly and winds a fine cotton thread around the rubber It is then fed through another bobbin which winds a second cover of cotton in the other direction While the winding goes on, the rubber is stretched to double its flaccid length in order that, when it relaxes, it may expand and fill the cotton coating completely The completed string is and form a firm string then heated in order to render it more solid and The completed thread may be compared to a flexible tube full of elastic jelly It has the property adapting itself to a slight tension has a "tone" like that of an artery which transmits the impulses of the heart In fact, the elastic stocking performs for the veins the functions of the elastic and muscular coats of the arteries rubber stocking applies little or no pressure to veins when they are empty, but when they are enlarged, it springs into action with a force directly proportional to the fullness of the veins Many doctors suppose that the object of the elastic stocking is to exert a considerable degree of pressure constantly, but the pressure is not exerted to any appreciable extent unless it is required by the distension of the veins

When an elastic stocking is stretched, it is seen to be composed of two sets of threads first a rather coarse rubber thread which runs horizontally and is intended to encircle the limb, and second, fine threads which bind the rubber threads together

There are two general types of stockings, the seamed and the seamless The seamed is the original type and is still standard for the stocking which fits with the greatest exactness. It is woven flat on a hand loom whose operation requires skill and judgment. The looms are designed and built in Nottingham, England, and embody the same principles that are used in the great power looms for making lace curtains. However, the looms for weaving elastic stockings are small and are worked by hand power. Each rubber thread is passed back and forth like the woof of woven cloth, while the fine cotton threads which bind the rubber together are woven in such a manner that the fabric may stretch sidewise but is unvielding lengthwise.

The next step consists of sewing the edges of the stocking together so that its seam shall be flat. This is done on a sewing machine which applies the stitches on one side only and leaves the fabric flat on the side next to the skin

Seamless elastic stockings are woven on power looms and according to a standard measurement While they will be satisfactory to some person whose legs happen to conform to the shape of the stocking, it is usually by far the best plan to have a stocking made to exact measurement. In fact the manufacturer cannot usually fit a person unless the weaver has a measure before him. The seamed stocking can be shaped with far greater ease and accuracy than the seamless one. The seam is no objection, for the finest hosiery is seamed.

The color of the fabric has given the manufacturers considerable concern. It would be supposed that a flesh-colored fabric would be the most inconspicuous, but such has not been found to be the case. An elastic stocking that is worn under another stocking is the least conspicuous when its own color is something between a dull lavender and a light tan,—a color which in itself is by no means pleasing

Fitting an elastic stocking is a work to be done It is always best that a physician should send his patient to the manufacturer to be measured and fitted When once a stocking of the proper measurement has been secured, it may be duplicated at any time The fitters are usually expert workmen who have shown a special aptitude for diplomacy in dealing with customers While they are not trained in orthopedics or any other branch of medicine or laboratory work, yet they do know the character of the goods on which they work, and can construct a stocking to fit any They are therefore to be classed among the skilled assistants of physicians They are not merely salesmen, but they are the scientific advisors of the physician and his patients

2

THE DAILY PRESS

MUSCLE AND NERVE REACTION TIME

The time required for muscular reaction to a signal has an important bearing on safety and the prevention of accidents

The New York Herald-Tribune of Sunday, July 22, has a description of a ten-car electric train on the Long Island Railroad running into an open draw bridge over Jamaica Bay Only the forward car left the tracks, but that one plunged into the bay and stood on its forward end in twenty feet of water, but all the occupants escaped safely The motorman, under arrest, is quoted as saying

"I was sick—sick to my stomach, when we left the Flatbush station I saw the signal set against me, but I passed it I saw the bridge open, too I don't know why I passed it The first thing I knew after that, I struck the water I hadn't anything to drink I needed sleep and was sick"

This motorman was probably trained to respond quickly to signals, and yet he not only disregarded the danger signal but also failed to respond to an open draw in the bridge. It would seem to be simple prudence to install a device which would stop a car approaching an open draw bridge, but in practice railroads depend on one man to see the signals and stop the train when danger threatens.

Few persons realize the intricate nervous mechanism which is involved in responding to a signal, or the time required for a man seeing a signal light or bell, to set the brakes of a car

When a motorman responds to a signal, the order of action is usually as follows

- 1 Reception of the sensation of a signal, either of sight or of sound, by the nerve cells of the cerebrum
- 2 Transportation of the nerve impressions to a motor cell, and its transformation into a motor impulse.
 - 3 Transportation of the motor impulse to the

anterior part of the grey matter of the spinal column

- 4 A transmission of the motor impulse along the nerve of a muscle
- 5 The contraction of the proper muscle, and the adjustment of that contraction to the need of the car

All this takes an average of 12 seconds in a normal person. One with a quick response may do it slightly under one second, while one who is slow will take two or three seconds.

Not only do persons vary in their quickness of response or reaction time, but the same person will show a varied reaction time under various conditions Seldom will a reaction time be hastened It will always be slowed by fatigue and by alcohol The danger will usually be in proportion to the slowing A car driven at the rate of thirty miles per hour will go about 45 feet in a second, and a motorman with a reaction time of four seconds will travel a length of a city block before he sets his brakes and begins to stop the car danger of fatigue is therefore obvious The motorman in the accident confessed to no response at all to a danger signal, and gave as his excuse that he was sick and sleepy - and he probably told the truth

Who was responsible for the motorman's condition? The obvious duty of the railroad was to know the reaction time of every motorman, and if he is markedly slow, to reject the application at the outset. The slowing of the individual motorman under various degrees of fatigue should also be known, and if he is subject to undue fatigue, he has no place as a motorman

A physical examination of applicants will detect the majority of those who have slow reaction time, and will prevent a large proportion of accidents. The subject is of such importance that R. H. Macy & Co. tests the reaction time of its auto drivers before they are engaged as motormen.

CANCER CONTROL

The mystery of the cause of cancer is now as deep as it was a generation ago at the beginning of a widespread campaign against it. One of the best popular descriptions of the lines of the campaign is contained in the following editorial from the New York *Herald-Tribune* of July 22

"The war on cancer like a campaign against any enemy, follows two contrasted plans. One is to combat what the enemy does from day to day,

that is, to treat the symptoms of cancer and to remove its manifestations when they appear. The other is to try to learn the enemy's plans, so that they may be more definitely foreseen and frustrated. It is this second part of the campaign that is evidenced in discussions this week in London over the cause of cancer, for that cause is but another name for the ways and means that cancer uses to work its ravages against mankind.

In the simplest terms, the intelligence department of the anti-cancer army has imagined three different theories of the enemy's plans the theory that cancer is due to some invading germ, perhaps too small to be visible, but still a living agent which must be nourished and transmitted alive and which conceivably can be killed This theory is advocated notably by Dr W E Gye, of London A second theory is one which considers the causative agent to be some chemical. perhaps the "ferment" or "enzyme" referred to in the suggestions put forward in London by Dr James B Murphy, of New York, a ferment being merely a chemical of unknown nature, very tiny quantities of which have power to cause widespread and intimate chemical changes in other sub-The two essential differences between this theory and that of Dr Gye are that the ferment is not alive and that it may be elaborated somewhere inside the afflicted body instead of needing to be introduced from outside still a third theory, not importantly emphasized in London, which lays the blame for cancer on some

illness, self-contained and probably self-caused, of the particular living cells that develop into the growths. For this no foreign influence, either of gerin or ferment, would be necessary

"To decide among these three contrasted viewpoints is the task of the intelligence department of the anti-cancer army, that is, of the research It may be years before the answer is forthcoming, and in the mean time the captains on the actual firing line must do the best they Without waiting for the staff to tell them what are the enemy's plans, these field commanders in the cancer hospitals must treat symptoms and remove cancers where they are removable, meeting each day's operations of the enemy as that day comes To give these firing line surgeons their best chance it cannot be too often repeated that the duty of the public is early diag-Even without knowledge of how cancer is caused, the death rate of the malady could be reduced enormously if every one sought instant medical advice on the appearance of any disquieting symptoms"

HOLDING UP PHYSICIANS

The New York Herald-Tribune of July 23 prints a letter from Dr J Gardner Smith, 21 West 122nd Street, New York, regarding robberies and hold-ups of physicians and dentists, both in their offices and on their way to patients The letter says

"I am requesting the Medical Society of the County of New York to protect the lives and property of physicians when making calls at addresses strange and unknown to them. With the approval of Police Commissioner Warren, could not the society notify all physicians to telephone immediately to Police Headquarters in advance of making such calls, so that a policeman or detective could meet or precede the physician in an effort to apprehend criminals?"

The Doctor is also quoted as saying

"Conditions now are such that when I get a call at an irregular hour from an unknown patient, I refuse to answer it unless I am afforded protection. The reaction of this underworld work is that doctors are absolutely afraid to go to people who may need them very much, unless they are known. These things all injure persons who are actually in need of a physician. It is for the

protection of meritorious cases of worthy patients that I wrote the letter"

While sneak thieves may consider the valuables of physicians and dentists and their patients as their legitimate prey, there is the further fact that physicians on their way to patients are immune to hold-ups to a greater degree than any other group of persons. The physician is admitted to private houses and dens of vice without question when his profession and mission are evident, for his errand of mercy is respected even by thieves

However, there are other phases of medical relations to be considered. A physician is respected only so long as he is entirely truthful and sincere. But there are increasing numbers of instances in which physicians have been impersonated by non-medical men. Ambulance chasing physicians have claimed to represent patients when they had no right to go near the cases. Also physicians have been known to pretend to be on medical missions when in fact they were on a sporting lark. Such a case is discussed on page 937 of the editorial department of this issue

The medical profession faces a serious problem in preserving the sincerity of action of physicians

BOOK REVIEWS

Bedside Diagnosis By American Authors Edited by George Blumer, M D Three octavo volumes, totalling 2820 pages, containing 890 illustrations Philadelphia and London, W B Saunders Company, 1928 Cloth, \$3000 a set Separate desk index volume free.

This is an excellent and complete system of medicine by sixty-four American contributors. The title of "Bedside Diagnosis" is not exactly applicable to this set of three volumes, for many pages are given over to instrumental and laboratory methods such as electrocardiography radiography, and bacterial cultural characteristics. A large part of Volume III is devoted to the gross and microscopic anatomy of the nervous system. Too much space is alloted to such diseases as undulent fever, 24 pages, plague, 24 pages, leprosy, 22 pages. On the other hand, pneumonia is dismissed with about 8 pages, typhoid fever, 12, and pulmonary tuberculosis, 21 pages. On the whole, most of the articles are up-to-date and contain references to the recent literature.

RECENT ADVANCES IN OPTHALMOLOGY By W STEWART DUKE-ELDER M A., D Sc. Octavo of 343 pages, illustrated Philadelphia, P Blakiston's Son & Company, 1927 Cloth, \$3 50

The most difficult factor in reviewing the recent works on opthalmology which have come to us from the writers of England is the continual temptation to enthuse over each chapter. This is particularly true in discussing the value of this little volume by Duke-Elder. Moreover, others reading the book are similarly affected, for, new as it is, writers feel compelled to commend it in their scientific writings. (G. O. Ring, Amer. Jour. of Oph. Jan. 1928, P. 35)

In the preface the author points out the scope and relation of his effort.

- 1 To supply a connecting link between the text-book and the bulky and cumbersome periodic literature.
- 2 To indicate the acceptable and reliable steps of progress in opthalmology during the last few years
- 3 The book is written for the senior student.

The material presented represents (though he does not state the period) additions to ophthalmology during the last twenty-five years or thereabouts. The writer has separated the wheat from the chaff and presented his morsels of scientific pabulum in a very wholesome and well-balanced manner.

The jumor and senior alike should carefully study this work as is very evident from the first sentence of the introduction in a quotation—"There is nothing permanent but change nothing certain but that everything is uncertain"

The material is well arranged and its viewpoint so broad as to include the most progressive work from the lowly atom and the theory of relativity to the fundamentals of operative procedure. The growth in our field of physics, embryology, anatomy and physiology is presented as the stepping stone for the chapters on pathology, diagnosis and treatment. Special subjects are accentuated as cataract, glaucoma, and ocular neurology, and the present status of the slit-lamp, red-free light and physio-therapy are clearly shown.

It must be obvious to every one that the presentation of this material presented a complex problem, but the author has certainly made a very worthwhile contribution to ophthalmic literature in arranging it.

CLINICAL RESEARCHES IN ACUTE ABDOMINAL DISEASE By ZACHARY COPE, BA, MD Second Edition Octavo of 214 pages, with illustrations London and New York, Oxford University Press, 1927 Cloth, \$350 (Oxford Medical Publications)

It is quite interesting to see a physician or a surgeon trying to justify his existence in the scale of things medical. A delightful peroration is here exhibited as to the relative merits of the surgeon and the laboratory man. There is no suggestion that the two should be combined, which after all is the ideal way.

The author has in his mind to call attention to some neglected methods of examination in connection with acute abdominal diseases, and is most interested in hyperaesthesia. Sherren found this in 32.3 %, Robinson in 21%, and the author in 59% of acute cases of appendicitis. In all abdominal cases regardless of cause the author has found this phenomenon in 47%

The location of the hyperaesthesia in each condition is clearly shown by graphs, which are easily remembered

He devotes considerable study to the signficance of phrenic shoulder pain, and gives a list of diseases in which this phenomenon may be expected, but in no event without involvement of the diaphragmatic area

Subacute perinphritic abscess without kidney disease is discussed, and the essential criteria for its recognition presented. Equally as interesting discussion is given of extravasation of bile.

An unusual condition called "Acute Ascending Paren chymatous Enteritis" is described with the symptoms, and the treatment.

A simple presentation is given at the close of the book at Shock and Collapse.

This is an interesting discussion of more or less overlooked signs and symptoms in connection with acute diseases of the abdominal organs, and the author has carefully tried out their relative merits. It helps pave the way to a more perfect examination of the suffering

J ARTHUR BUCHANAN

NEPOLASTIC DISEASES A Treatise on Tumors By JAMES EWING A.M., M.D. Third Edition, revised Octavo of 1127 pages, with 546 illustrations Philadelphia and London, W. B. Saunders Company, 1928 Cloth, \$1400

The American classic on tumor pathology appears in a new third edition. Its simplicity of style makes reading it delightful, yet the voluminous details and excellent illustrations will satisfy the most critical scholar.

The author begins with a complete review of the present theories of the nature and etiology of tumors and discusses the methods of their metastasis

Then follow detailed descriptions of tumors classified according to their origin epithelial, mesenchymal, muscular, nervous or vascular

Finally each organ and glandular structure receives a complete analysis of its tumor pathology

The chapter on Sarcomas of Bone has been rewritten to conform to the classification adopted by the Codman Registry of the American College of Surgeons

HARRY MANDELBAUM

OUR NEIGHBORS

MEDICAL PUBLICITY BY COUNTY MEDICAL SOCIETIES

The Medical Society of Bergen County, New Jersey, has appropriated one thousand dollars for medical publicity during the coming year. The following account of the action, from the pen of Dr S T Snedecor, reporter for the county society, appears in the July issue of the Journal of the Medical Society of New Jersey—Editor's note

"Bergen County has decided to promote ethical medical publicity After careful consideration of the report of the special committee, consisting of Drs Donald A Curtis and Harry B Wolowitz, the society accepted the report and passed a resolution appointing a Committee on Public Relations with an appropriation of \$1,000 to spend on publicity this coming year The report of this committee is of special interest to all members of the profession and is herewith printed in full

"Report of the Committee on Publicity

"'This Committee has investigated the question of publicity by the society and has come to the following conclusions

- "(1) That a properly conducted compaign of ethical publicity sponsored by this society is most desirable as a means of clarifying the relationship between the physician and the public, of stimulating interest in matters medical, of educating the public in the prevention and early recognition of certain diseases, and of opposing the cultists
- "'(2) That such publicity must be of two types, direct and indirect. The direct method means the insertion of material in certain publications by paying for space. The indirect method calls for free publication of articles of public interest and for public benefit. All material is to be released under the name of the Bergen County Medical Society.
 - "'(3) As for direct publicity, the cost can

be nominal at first and increased later if it is found desirable to widen the scope of our publicity. For example, the Bergen Evening Record charges 63 cents an inch per day. For an "ad" two columns wide by six inches high the cost is \$7.56 a day. If such an "ad" were inserted twice a week the annual expense would be \$786.24. However, by contracting for a certain space to be used at stated times this cost can be decreased a little. Furthermore, the copy will be written by The Record without additional charge. If it is preferred to have a professional copywriter do the work an additional expense of 20% of the advertising cost must be included.

"'(4) That there is a wealth of material for indirect publicity which is easily accessible The State Society Journal, the Anti-tuberculosis, Anti-cancer, and Red Cross Societies all have interesting copy that they are glad to furnish without charge. In addition, members can help by submitting short articles on various medical subjects

"'This committee therefore recommende

- "'(a) An active campaign of ethical publicity be embarked upon by this society as soon as possible
- "'(b) A publication committee be appointed with power to go ahead-and make all arrangements and contracts for such a campaign. It is suggested that this committee consist of men who have had previous experience in work of this sort, and that they be preferably volun-
- "'(c) Direct publicity be published in one or more daily papers of wide circulation in the county at least once or twice a week, and that articles for indirect publicity be presented three times a week'"

ETHICS AND DISCIPLINE IN MASSACHUSETTS

The Report of the Committee on Ethics and Discipline of the Massachusetts Medical Society considers a number of subjects which are of interest to general practitioners of New York State. The following extracts are taken from the report printed in the New England Journal of Medicine of June 28

Disciplining Members - The Committee held

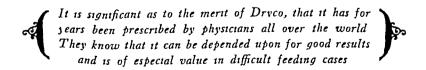

five meetings during the year, and its sub-committees held numerous conferences and investigations. The matters brought before the Committee were of the usual type but were both more numerous and on the whole of more serious character than usual. Indeed it seems to the Committee that whether due to the changing spirit of the

What?

Milk With a Bacterial Count of Less Than 100 per c.c.?

Dryco is the milk of which this enviable record is true! The bacterial count is consistently below 100 per c. c. and these are harmless spore formers! This information is valuable to every physician who wishes to avoid the incidence of milk-borne infections which are especially prevalent among infants during the warm weather.

RADIUM HOSPITAL

BROOKLYN 784 CARROLL ST. BROOKYLN, N Y

NEVINS 1350

Adequate amounts of radium available for treatment of all benign and malignant conditions Patients referred can be treated either at this or other hospitals or at their homes. Radium rental service, radium emanation, radium water and radium for intravenous injection. Co-operation with members of the medical profession desired.

CHESTER FORD DURYEA, M.D. DIRECTOR

(Continued from page 950)

times or to the increase of alien elements in the profession, the ethical standards of physicians are tending to seek a lower level. No fewer than four Fellows were recommended to the President for expulsion from the Society In three of these cases it has been recommended that their resignations be accepted in order to avoid the useless expense and the notoriety connected with a board These were all instances of the performance of or the attempt to perform illegal The fourth case is that of a Fellow abortions who in a suit for malpractice against a fellowmember, in his testimony for the plaintiff made statements not justified by the facts, and evpressed opinions which were not in accordance with medical experience or teaching. His license to practice was revoked by the Board of Registration in Medicine

Unethical Advertising - Charges of unethical advertising have as usual occupied a great deal of the Committee's time and have presented the usual perplexing problems. One of the abuses which is creeping into the ethical practice of medicine is due in part to the employment by charitable hospitals and clinics of professional promoters of campaigns or "drives" for the collection of money These professional managers, not being themselves physicians, are actuated by the standards of commerce rather than by those of a liberal profession. They are likely therefore to employ methods of publicity and advertising which are offensive to the traditional standards of our profession. Pictures of physicians are printed in the daily newspapers representing individual members of the Staff of these institutions in the performance of their merciful duties, and articles extolling the professional work of these physicians are published, as a recommendation to the public of the merit of the institutions which these gentlemen serve Such publicity methods, in these instances wholly ethical and proper in their purpose, are pointed to with justice by other members of the Society when they are called to account for similar advertising of a more personal character If great charitable institutions permit such advertising of the achievements of their professional Staffs, and this is condoned by the Massachusetts Medical Society, it cannot be expected that the similar but less conspicuous violations of our traditions on the part of individual Fellows, shall be controlled by the authority of the Committee on Ethics and The professional Staffs and Superintendents of medical charities should not permit themselves to be thus exploited by the laytrustees of the institution or by professional managers of campaigns for the securing of endowment

(Continued on page 954-adv xv1)

An important recent development in infant feeding

The colloidal action of Knox Sparkling Gelatine is particularly desirable in the summer diet

THE colloid-chemical power of gelatine has been proved by Drs Alexander, Bogue, Downey and other authorities Gelatined milk is being used by many physicians and in many institutions It is more easily digested and absorbed It increases the available nourishment of the milk mixture Because it prevents the formation of large curds, it helps overcome regurgitation and vomiting. It is useful in the diet of infants with curdy stools, diarrhea, constipation, colic or excessive gas formation

In addition to its proved value in infant feeding, Knox Sparkling Gelatine is an important adjuvant in the diabetic diet, where it increases protein content and satisfies the craving of the patient for bulk in his food. In liquid and soft diets, Knox Sparkling Gelatine adds variety to the menu with dozens of dainty appetizing dishes

For 40 years Knox Sparkling Gelatine has been our one standard product. From raw material to finished package, every process in its manufacture is subject to constant chemical and scientific control Knox Sparkling

CAUTION

All gelatines are not alike. Many have added acid flavoring and coloring matter. In the form of ready prepared deserts they contain as high as 85 per cent carbohydrates.

carbohydrates.

Anox Sparkling Gelatine is a protein in its purest form particularly suitable where carbohydrates and acids must be avoided. It contains more than 80 per cent pure protein (4 calones per gram) and has the same neutrality as milk. Specify knox when you prescribe gelatine and you will protect the patient from brands unsuitable for his dietary purposes.

Gelatine is all pure gelatine, unbleached, unflavored, free from sugar

> Valuable dietetic information available

Noted dieticians have prepared the following booklets, setting forth the value of Knov Sparkling Gelatine in medical practice, and offering many appetizing recipes for its use in the various prescribed diets. Data on interesting scientific tests is also available Simply check the coupon below and mail it to us

Any Artistic Workman Can Produce a Handsome Artificial Limb

But what about fitting the stump? What about the alignment of the artificial limb? What about durability? What about pressure at the sensitive points? Not to mention such important matters as the special care of the stumps of diabetic patients

The manufacture of artificial limbs is a science as well as an art. Mastering it is the work of a lifetime. The house of A A MARKS, Inc., has given three generations to this work, and respectfully places its skill at the disposal of your patients.

Supervision of Private Cases in Hospitals— A somewhat novel problem has been presented by the appointment by certain small hospitals throughout the Commonwealth whose Staffs are "open," of a supervising physician or surgeo who is charged with the duty of overseeing and if need be of criticizing the work of his professional colleagues of the community who may have private patients in the hospital with a view of insuring that all the work done in the hospital shall reach a certain standard of excellence. If such a supervisor is a man of ability and per forms his duties conscientiously it seems clear that the good of the patients is served, but it is also clear that such supervision appears to be meddlesome and offensive to the physician whose patient is the subject of investigation Certainly in private practice such a relation of physicians would not be tolerated, and the fact that the Staff is "open" rather than organized according to seniority or authority makes this relation as diffi cult as where the patient is ill in his own house. It is clear that where this arrangement exists it should be made amply clear by the governing authorities at the hospital that any physician who has a private patient there must expect to have his work overseen by the physician appointed as supervisor It is also clear that in the exercise of his duties the supervisor must be governed by the greatest tact and consideration of the feelings of his brother physician Any other attitude would lay him open to the charge of a violation of the traditional mutual relations of Fellows of the Society

MEDICAL PUBLICITY IN WEST VIRGINIA

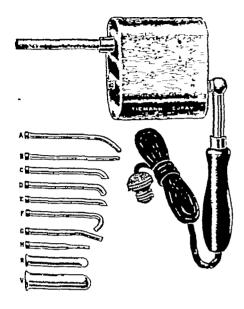

The report of Dr J R Schultz, Chairman of the Committee on Professional Relations of the West Virginia Medical Association appears in the July issue of the Journal of the Association The following extracts show the scope of the work of the Committee

"The business of the Committee on Professional Relations is to get before the lay public the value of scientific medicine, to educate the public on various matters of health and the advantage of periodic health examinations, and to tell the public what it should know about the medical profession. In other words, the Committee on Professional Relations is the liaison officer between the doctor and the public at large.

"Up to the present year we have tried to attain our objective through the newspapers of West Virginia It has been a tough battle and we have been losing ground year after year The reason for this is easily to be seen The doctors

do not advertise and the newspapers dependipon advertising for their very existence. As consequence, most of the material we sent out to them quickly finds its way into the waste based to them quickly finds its way into the waste based to th

"At the council meeting in December, 1927 we outlined our new plan and it was unanimously approved. Then we went to work. At the present time we have twenty-four doctors, located all over the State, who have agreed to go out when called upon and talk before the West Virgin service clubs in language that the public can understand. These doctors were selected for the oratorical ability, and they were lined up about the first of March.

"Shortly after the first of March we sent out letters to the Lions and Rotary clubs in West Vir ginia, notifying them that we had a number of speakers available for duty, whose subjects would deal with the relations between the physician and the public. We set forth that these speakers could be had for the asking. To date we have filled a number of engagements and in practically every case, the speeches by our own doctors were picked up and published in the news papers.

"When a request is received from a club for one of our speakers, we get in touch with the one living nearest to the city or town in which the club is located. But we never allow a doctor to address a club in his own home town, for we believe that no man is a hero in his own community."

"In furthering the work of the Committee on Professional Relations, my only suggestion is that all of you, when the opportunity presents itself, lend any assistance you can to the newspapers in this State. We may feel that their attitude toward the medical profession is unjust, but that is not the point. The point is that the newspapers are none too fond of the medical profession, and that's all there is to it. Those of you who own or operate hospitals, or who are employed by your city, county or state governments, are in an excellent position to build up more friendly relations between the press and the profession.

"Some day I hope the time will come when the West Virginia Medical Association can set aside an appropriation to combat through advertising the vicious paid publicity of nostrums and quacks in this State When that day arrives, it will be a simple matter to place scientific medicine in West Virginia up a few rungs upon the ladder of enlightenment"

(Continued on page 957-adv xix)

(Continued from page 956-adv viii)

Two points in this report are worthy of comment. The first is that no doctor is authorized o speak in his home town, and the second is the trained relations between the doctors and the newspapers. However, these conditions will right themselves if the Public Relations Committee carries out its plans.

THE NEW JERSEY ANNUAL MEETING

The July issue of the Journal of the Medical Society of New Jersey contains an editorial on its annual meeting, June 6th to 9th, from which the following extracts were taken—Editor's note

The 162nd Annual Meeting of the Medical Society of New Jersey proved to be the largest and best in the long history of this organization

The number of members registered was 443, as compared to 390 the previous year, an increase of approximately 14% Such evidence of growth is very gratifying to those who labored upon construction of the program and development of the infinite details attending upon such a convention

The general scientific program was most attractive, and yet we cannot see a sufficient degree of difference in that respect to account for a material increase of attendance. To what e tent the new sections showed drawing power it is difficult to say but we believe it was very considerable, and probably accounts for the major portion of increased attendance. At all times, throughout the four sessions of each section on Thursday and Friday, the meeting rooms were well filled and interest in these special programs was deep and sustained

The next most important difference from previous meetings was the coincident gathering of the Woman's Auxiliary, where the registration figures mounted well above 100. There is no doubt in our mind that a large share of the credit for increased general attendance is due to the Auxiliary. If called upon to apportion the honors we would say that at least as much credit for bringing members to the convention was attributable to the Auxiliary as to either of the new section programs.

ludging from figures presented in the past it would seem fair to say that an allowance of 10% would cover the normal natural swelling of membership registration. If the remaining 90% of the increase be divided equally among the Auxiliary and the two new section meetings, we find that each of these three factors proved their value to the Society in a decided manner, and the conclusion points clearly

THE PHYSICIAN THROUGHOUT THE

The following editorial review of a recent book is contained in the Medical Journal and Record of July fourth

It is characteristic of this so-called practical, age that few persons, even among physicians, know anything of the cultural aspects of medicine, of the way in which the science of medicine has attained its present high position in the healing art, of the difficulties that had to be overcome, of the persons who played the leading roles in this advance, of the biographical and historical It is well to background of these individuals pause once in a while and look back to take stock of the achievements of medicine Each period of time steps on the shoulders of the preceding period and benefits by the accomplishments of these periods. Thus is advance pos-Familiarity with the lives and labors of sible those who have contributed to medical progress not only provides human interest but is also an inspiration to future endeavor. In the hustle and bustle of modern life it is too easy to forget New developments crowd upon us 50 fast that they are accepted as part of the daily science and practice almost before their origin and development have become impressed upon those who have occasion to make use of them

Little indeed has been written about the physician's great services to mankind This is the unpelling motive that has induced Arthur Selwyn-Brown though himself not a physician, to write The Physician Throughout the Ages work of the physician is traced from the earliest times down to the present day with sufficient detail to enable the reader to form his own conclusions as to the status of the medical profession After describing the hisat any given period torical background of each period of time, the leading lights of that particular era are mentioned and their work recalled—the only way to give a truly historical picture of progress of the Thus the evolution of medicine is medical art traced

(Continued on page 959-adv XXI)

(Continued from page 958-adv x) .

The role of the physician as a great ameliorator sorrows and a sage friend, national adviser, alige and even ruler is shown. This book will doubtedly serve as a literary monument to scientific and beneficent accomplishments of medical profession.

THE MEDICAL RADIO

The July number of the Journal of the Missouri ate Medical Association contains a report of —e Committee on Public Policy, which discusses e radio as follows

Radio —One of the most important matters of terest coming before this committee was the imaging effects upon public health education of roadcasting over the radio by quacks, patent redicine manufacturers, and various commercial roups seeking to make financial profit for themalies and advance their own selfish interest ander the guise of "public health lectures"

The matter has been taken up first, with various roadcasters direct, second, through the Federal adio Commission at Washington, and third, with the United States Congress in session in Asshington

We have found that the various broadcasting rms are quite sensitive to criticism by the organted medical profession. Where not bound by ontract they have mostly acceded to our proposals to keep the field of public health above exploitation However, their expense is great in coroadcasting a program and there is strong com-- nercial temptation in the offer of entertainers , and a cash bonus for an apparently harmless suppeal over the radio from the owner of a remedy "for sale, a "sanitarium" or "school" to be expoloited Many radio franchises are upon a firm Innancial footing and a very high plane and others are upon a "shoe string" The latter are prone y 0 listen to any one with cash We must insist that commercial exploitation be kept away from senume public health education The influence not the profession is most valuable here

Congress flatly refuses to pass special rules in regard to broadcasting on public health topics. Your committee urged that all broadcasters of matter claiming to be health talks or conveying information on public health be required to be inspected and approved by the legal health authorities of the State in which the broadcaster is located. This was declared impossible. The whole radio subject is new and rules must be developed from needs as they appear.

Bills in Congress affecting the medical prolession have been reported by the Secretary

BROWN RICE

The June 20th issue of the Medical Journal and Record contains the following editorial comments on forms of rice in the market. This information will be of interest and value to the family physician—Editor's note

"Rice is the chief cereal in the diet of mankind. This is because of the large amount used by the inhabitants of Oriental countries. It is classified as unhulled, cured or brown, and polished or white. The brown and the polished forms are the ones which interest us..."

"The advantages of polished rice, the form which is used almost exclusively in the United States of America, are that it is easily kept, has, to many, an attractive appearance, and is not irritating to the stomach in cases of gastritis or ulcer The fact that it is easily kept makes its shipment to distant countries possible The white color appeals largely because we have become accustomed to it cum is used in the polishing and this accounts for the milky appearance of water in which it is soaked

"Strange to say, much has been written in this country on the advantages of entire wheat products but little regarding en-The analysis shows a tire rice great similarity between the comparison of entire wheat and wheat products and refined brown and white rice. The same reasons can be urged for using brown rice as for whole wheat The polishings that are thrown away are the most nutritious parts of the grain, except in fuel value alone There has been some increase of late in the use of brown rice in the United States, but it is safe to say that the majority of our population have never tasted it"

Itoland Water

is not merely a pure table or bottled water, but it is a valuable adjuvant in the treatment of many forms of kidney trouble on account of its bland diuretic properties

THE PRACTICING PHYSICIAN IN COURT*

By L HOWARD MOSS, M D, RICHMOND HILL, N Y

THE decision to enter the profession of medicine is ordinarily made either prior to or during the period of preliminary education, rarely subsequent to college graduation. So far as there is any anticipation of the study of medicine, at most it consists of the pursuit of studies in the sciences, such as, physics, chemistry biology and bacteriology and possibly the mental sciences, that are regarded as fundamental to the science of medicine. Courses of instruction that have even a remote bearing upon legal practices either in court or out, are not only not included in pre-medical education, but are not even included in the list of suggested electives.

In the Medical School, the instruction includes certain basic subjects pursued in the earlier part of the curriculum, including in addition to those already mentioned, anatomy, physiology, pathology, and pharmacology, with their ramifications. Here, for the first time, may be presented to the student, anticipating specialization in public health, something pertaining to law and order. He may be permitted to spend a few hours in

the study of sanitary law Later in the medical c

Later in the medical curriculum, the instruction is devoted entirely to the various fields of clinical medicine, including internal medicine, dermatology, neurology, surgery, otology, rhinology, laryngology, ophthalmology, obstetrics, gynecology, pediatrics and to a limited extent psychiatry. Some institutions give a few lectures on medical-jurisprudence

If he emerges successfully from his struggles through this imposing list of studies of the science and art of medicine, and passes the board of medical examiners in the state where he anticipates the practice of his profession, he is legally recognized as qualified to practice medicine

Sooner or later, however, he is confronted with a demand for services for which he not only has no specific preparation, but of the very existence of which he may be wholly uninformed, or at most has heard of only as a remote possibility. He is called into court. Here a new world con-

fronts him Of the methods of procedure, of the rules of evidence, of his particular obligations and rights, he is wholly uninformed, so far as he has received any instruction for his career as a practicing physician

Notwithstanding this condition of unpreparedness, his obligations far transcend those of any ordinary witness. By reason of his professional status, he may be asked not only to testify as to facts within his knowledge, but to give his opinion as to the significance of these facts. That is to say, the Court recognizes him as a super-witness, an expert.

As a practicing physician, he is received alike into the home of rich and lowly, as a messenger of hope. The treatment accorded him is almost universally friendly and even gracious. He enters to render a much needed service and as he leaves the home the appreciation of the good offices he is rendering is apparent. "Thank you so much, Doctor. We are leaving everything in your hands and know that you will do all that can be done." Thus, he is accustomed to responsibility, and it is his aim in life to merit the trust and confidence which is imposed on him. Lack of confidence, lack of trust and lack of appreciation are rare exceptions.

His very entrance into the courtroom, reveals to him a different atmosphere to what he is daily accustomed. He has been issued a subpena to be present at 10 A M and give testimony in the case of James Brown vs. the X-Y-Z Corporation. He recalls that a year and a half ago he was called to attend little Jimmy Brown, the son of James Brown, and was told that the day before, while playing in the street, he had run into and been hit by a vehicle of the X-Y-Z Corporation. There had been no intimation that blame was to be attached to any one, other than Jimmy, since he was playing tag or attempting to steal a ride. The physician did not just remember the detail of what Jimmy was doing

He remembered clearly that the boy was suffering merely from minor injuries. There was a slight simple contusion of the right thigh and the right shoulder, hardly calling for treatment

^{*} Address of the incoming president, presented before toe Society of Medical Infisprudence at the New York Academy of Medicine January 9 1028

However, he prescribed rest in bed for a day or two, and suggested a mild lotion. It would at least keep the boy off the street. On leaving, he told the mother that if it would relieve her mind she might bring the boy to the office after a tew days, and he would look him over again. The people were in moderate circumstances, so he made his fee \$2.00, which was paid by the relieved and apparently appreciative mother.

He remembered that about a month later, the mother had brought the boy to the office Wouldn't he examine his spine? It seemed to his father, and the mother concurred, that there was a slight curvature of the spine. To be sure, it was very slight, but they had never noticed it before He examined the spine It was easy to appreciate how an uninformed and imaginative person might convince himself there was a very slight curvature, yet it was about as straight as boys' spines usually are, and presented no basis for the opinion that it had been in any way of to any degree, whatsoever, injured by the acci-Something was said about having a specialist examine the spine, but the physician did not remember anything very definite on that point

About a month before the serving of the subpena, the physician had received a call from the boy's father, accompanied by a stranger, whom he introduced as a representative of the firm of lawyers who were handling the case of his son's injury. They informed the physician that the case was on the next calendar and should be reached early. The stranger wished merely to refresh the physician's memory in regard to the boy's condition when he had attended him, following the accident.

On learning that the physician had made no extensive record of the case, the lawyer stranger reminded him that the boy suffered from severe shock, that there were extensive contusions over the entire right side of the body, and that there was evidence of twisting of the spine The physician was quite clear in his memory, and from his record, that the case showed merely slight contusions of the right shoulder and thigh "Try to refresh your memory on these points," suggested the lawyer "We shall want you to testify and it is important that you recall all of the details mentioned Of course, you will be well paid for your testimony, if we obtain the verdict to which we are clearly entitled," assured the lawyer stranger, as he was leaving

The physician was mystified It couldn't be possible that he had failed to appreciate the seriousness of the boy's injury. He, of course, would be willing to tell the Court just what he had observed. He had answered the subpena with that intent firmly in mind.

Somehow the Courtroom did not present the appearance he had expected. Although it was now five numbers of ten there was considerable

disorder Many were in seats, others were stand ing around in groups, chatting more or less friv olously Men in some instances had their hats There was no apparent effort at order or decorum After a while, he espied in a far part of the room, little Jimmy Brown with his mother and father, and the lawyer stranger who had called a month previously The latter immedi ately came over and led him to another man to whom he introduced him, saying "This is Dr A who attended Jimmy He is prepared to tes tify fully as to the extent of his injuries" Was it possible that the lawyer stranger winked at him as he made this remark to the new stranger, whom he now understood was Mr Jones, the trial lawyer for Jimmy? "Are you experienced as an expert witness?" inquired Mr Jones The fact that he was not, seemed entirely satisfac tory, and Mr Jones at once advised our physi cian, having his first super-man experience, that if he desired to make a good expert, he should limit his replies to the direct answer of questions asked him, and not volunteer any information It might hurt the case, he was warned Mr Jones let it be said, was a man of high standing in the legal world, a member of a well-known and, as he believed, highly successful firm of lawyers The advice of Mr Jones was not to be taken lightly He thanked him, and would be on his guard to follow it

It was now well past ten o'clock, and there was no indication of the Court doing business He heard an attendant remark that the Judge Stepping was in conference in the Chambers out into the corridor, he came unexpectedly upon Mr Jones, in conference with little Jimmy and his father "Now, Jimmy," Mr Jones was saying, "you remember just how this accident occurred, don't you?" "Oh, yes sir," replied Jimmy, "I was playing—" "You mean you were crossing the street, don't you?" interrupted the trial lawyer "Y-e-s," replied the boy-"and before starting across you looked up and down the street to make sure that the coast was clear, continued Mr Jones "Oh! yes," eagerly responded the boy, "and seeing no cars approaching in either direction, you started to walk rapidly across," said the lawyer "Oh, no," replied the boy "I ran" "Now think carefully," interrup-"When you come to think of it, ted Mr Jones aren't you quite sure that you just walked briskly across the street at the crossing?" "Oh, but I did run," repeated the boy Mr Jones, apparently annoyed by the persistence of the lad, turned a bit sharply to the father with the state-"Well, if the boy insists on saying that it is no use to continue with the case. No jury on earth will give a verdict under such circumstances" Thereupon the father took the box in hand, saying gently "Now Jimmy, you know that Mr Jones is a great lawyer who is trying to help you' "Yes su,' came the reply, somewhat hesitantly, "and he knows a great deal more than either you or I," continued the elder James "Yes," said Jimmy, "and if he said you walked across the street, why in all probability that is right." "Now, you're only a little boy and don't fully understand how important it is to say it just the way Mr Jones tells you to Now think carefully, and see if you can't say it exactly as Mr Jones wants you to" "I'll try," faintly replied the boy, and leaving them further rehearsing the testimony, our young physician, in Court for the first time as a super-witness, returned unseen to the Courtroom, his confidence in the integrity of evidence somewhat shaken by what he had overheard

It was ten thirty-five when the court officers awoke the waiting assembly to attention were ordered off, those sitting were aroused to their feet, and the Court entered and ascended the bench, the Court crier proclaimed his "Ovez! Ovez!" and something more, ending with "you shall be heard," and the attendants ordered everyone to be seated. At last something of the dignity and order that had been expected was assumed Now, surely, the trial to which he had been subpenaed was to begin "Call the calendar," said the Court Thereupon, the clerk read from a list the names of cases, to which there were various replies from the audience such as "defendant" or "plaintiff ready," after which there were conversations, frequently heated on the part of the one addressing the Court difficult for a mere witness, even though he be a super-witness, to understand much of this proceeding, excepting that three-quarters of an hour were thus consumed Finally, Mr Tones emerged from the group surrounding the bench and came towards them "We are number 27 on the calendar" was his remark "and we ought to be reached any time within a week or ten days I will let you know beforehand" he remarked "Then the case is not to be tried today?" remarked the physician "No, but we had to be Sometimes the whole list answers 'unprepared,' and we have to go right ahead," was the reply "I wish I had known," was the physician's only remark, as he visioned the sacrifices he had made to answer the subpena, and the cases he had referred to other physicians "We shall try to be very considerate of your time, Doctor," said Mr Jones "Try and keep in touch with your office, and we will telephone you when the case is reached'

It is unnecessary to recite the period of waiting for the case to be called. How many times he called his office, lest the summons should come and he not be within reach. The hours he spent looking up the pathology, the symptomology, the sequellae of a simple contusion, lest he should be found lacking when the supreme hour arrived, the search of the medical literature for cases of curvature of the spine, induced by a fall or blow

that would leave a simple contusion of the right shoulder and thigh if such indeed existed. He had thought it all so simple, but he must at least justify his opinion, and modify it, if he found that he was mistaken

After two weeks of uncertainty, he was informed on arrival home at the close of a busy day, that Mr Brown had called up and left word that the case had been reached, the jury chosen, and the taking of testimony begun, and that Mr Jones wished him to be at the Courthouse, promptly, at 9 30 in the morning, for a conference He was to be the first witness of How was it possible, with his morning the day already filled with calls on important cases? He would do his best By getting out an hour earlier, he would see several of the more serious sick cases, and that perhaps would enable him to spend an hour at Court His testimony surely would not take but a few minutes—it was so simple By 10 30 at the latest, he surely would be free

Vine thirty the next morning found him at the appointed place. Mr. Jones arrived at fixe minutes of ten. He was very sorry to have kept Dr. A waiting, but several important matters at the office had detained him. After all, there really wasn't much to be said. He had gone over the case with the lawyer of record, and everything was understood between them.

The first procedure Court opened promptly was to withdraw the jury, while the lawyers discussed some technicality regarding the admission of evidence Both Mr Jones and the lawyer for the XYZ Corporation were fully prepared Each was given full opportunity to state and to cite cases in support of his views. Law books were produced the attendant several times going into the chambers, and returning with volumes for the Judge the attorneys standing respectfully by while he read and pondered Then followed more At first—each of the lawyers had teen calmly persistent. As the Court appeared to lean to a decision in favor of Mr Jones, the lawver for the XYZ Corporation grew more em-When finally the Court gave his ruling and the jury was recalled, Mr Jones appeared calm, while his opponent was visibly perturbed The mien of the Judge also was now sterner than It was 10 45 o'clock "Call your next witness, said the Court, somewhat briskly, addressing Mr Jones

Undisturbed, Mr Jones turned to our superwitness, and called in a voice easily heard throughout the Courtroom, "Dr A, will you take the stand?" The moment had arrived Assuming an outward poise that belied his internal feelings our practicing physician quietly arose, and started for the witness box, conscious that the eyes of all in the room were upon him. He had proceeded but a few steps, when he was firmly, even though gently grasped by the arm, and directed by a uniformed Court attendant to

alter his course and pass behind the jury box Disturbing as it was, it at least gave him a minute longer in which to get a hold on himself Emerging from behind the jurors, he found himself facing the witness chair, beyond which was the bench at which the Judge was seated, busy with his papers, and apparently unconscious that a man of professional standing was approaching He started to sit down, but was restrained by an-"Raise your other attendant who said to him right hand" Whereupon, the clerk of the Court arose, and said in stentorian tones, easily understood, "You solemnly swear that the testimony you shall give in the matter now pending between James Brown, the plaintiff, and XYZ Corporation, the defendant, shall be the truth, the whole truth and nothing but the truth, so help you, God?" "I do," solemnly and sincerely asserted the prospective witness, ready to sink into the chair Not yet, however, continuing to restrain him from sitting, the attendant leaned forward, so as to bring his ear nearer the witness' mouth. and said in a loud tone "Name, please" Fortunately, his name was the one thing with which he was familiar Had it been otherwise, it is quite probable he would have been unable, certainly without considerable hesitancy, to comply with the demand made upon him. He gave it in sufficient voice, as he supposed, for every one to hear, nevertheless, the attendant turned to the Court reporter, seated immediately in front, and repeated the name in a much louder tone, as though every one present was not already fully aware who he was "Be seated," then said the attendant

Mr Jones arose With a deliberation that was reassuring, he addressed him "Dr A, will you state your place of residence?" The lawyer for the defense corporation was already on his feet extending his hand, in gesture to the witness not to speak Then, addressing the Court, he said. "Your honor, in view of your honor's ruling while the jury was out, I respectfully request the privilege at this time of further cross examination of the last witness, Mrs Brown" Mr Jones objected, explaining that Dr A was a very busy practitioner, that he had already been waiting in Court, an hour, to give his testimony, and that any further delay would impose a hardship upon His opponent regretted exceedingly the necessity for pressing his point, but assured the Court that it was essential that the further cross examination be conducted, before the testimony of Dr A was received "Withdraw the witness," ruled the Court, whereupon, the practicing physician was addressed by the attendant with the "Stand aside!" command

Mrs Brown took the stand How the cross examination was conducted, her replies, at times, timid and uncertain, again explosive and vindictive, the subsequent redirect examination in which Mr Jones attempted to fortify her story

where it seemed to have been weakened, and the many interpolated objections and discussions between the counsel and the Court, these are all beside the point. From it, the waiting practicing physician gained a new revelation of the case. For hours after the accident, the boy had been in a semi-conscious condition. The right side, including the arm and leg, were extensively brussed, from which the boy did not recover for two or three weeks, there had been extreme pain in the back for a period of months, with occasional recurrences, even at the present time, and as a consequence, the whole demeanor of the boy had changed From a perfectly healthy, robust lad, he had become weak, irritable and timid, unable to participate in the usual sports of boys, afraid to be left alone, even in the day, in fact he had become, since the accident, "a nervous wreck," as the mother expressed it.

It was 11.25 o'clock when our practicing physician was recalled to the stand "The witness has already been sworn," said the Court, as Dr A took the chair, this time quite ignoring any effort of the attendants to direct or restrain him. "Will the stenographer read the question that was asked when we were interrupted," asked Mr Jones, with a side glance at his opponent The question was read, and answered, and the usual qualifications to practice medicine were established

"Do you remember being called to attend Jimmy Brown, the son of James Brown, the plaintiff in this action?" questioned Mr Jones "I do," was the reply

"The witness will uncross his feet," stated the Court in a voice heard throughout the room Dr A looked at the Judge in amazement. Had he misunderstood him? Was the Court indulging in levity, that he should so address him?

The Judge repeated his command Dr A glanced at his feet, and then at Mr Jones, who motioned him to comply with the request. He reluctantly did so, the Irish in him thoroughly aroused, that he, a professional man, a practicing physician who had just qualified as an expert witness, and above all, that he, a gentleman, should be publicly subjected to such an indignity. Glancing at the jurors, he observed for the first time, that among them was a patient of his, from a well-to-do family that he attended The juror avoided his glance.

"About when was it that you first attended Jimmy Brown," continued Mr Jones in a gentle voice, as though to subdue his aroused feelings "On July 5th, 1925," was the answer "Now, of course, Doctor, we all appreciate that you see a great many sick people, and that it is sometimes difficult to remember all of the details of a particular case, but will you inform the jury, as fully as you can remember, just what you found when you first examined Jimmy Brown?" On objection from opposing counsel to the pre-

"The Doctor liminary remarks, the Court ruled may state what he found on his examination From Mr Jones, "Will you so state, Doctor" "I found a simple contusion of the right shoulder and the right thigh" "To make it plain to the jury, will you state just what you mean by a contusion, using every day language? And, Doctor, will you kindly direct your answers to the jury and speak loud, just as though you were talking to that last juror over there?" pointing to the farthermost juror on the back Dr A cleared his throat, took a deep and replied in full voice "Why a conbreath and replied in full voice tusion is a lesion resulting from trauma, I mean a blow, and a simple contusion is one in which there has not been produced any accompanying dermal discontinuity, that is the skin is not broken" "Does it necessarily mean that the blow has not been a severe one?" queried Mr "Not necessarily," was the reply it necessarily mean that the tissues beneath the skin have not been severely bruised, and the blood vessels torn, and possibly the muscles and the nerves injured?" continued Mr Jones was the reply

"Now, Doctor," interrupted the Court, "did you, in fact find injury of the blood vessels and tissues, generally, at the various sites where the bruises occurred of which you have testified?" "Yes," said Dr A "So that there was indication of the parts having been hit a severe blow that it what you want the jury to understand by your testimony on this point, is it?" said Mr Iones, resuming the questioning "Yes," was the reply

Further questions and answers covered the general condition of the boy, the Doctor testifying that the boy might have been a bit restless, and that he did not notice any condition of the spine at that time He had advised that the boy remain in bed, and the application of a lotion to the contused areas

"Now, when did you last see the boy in connection with the injuries from this accident?" asked Mr Jones, further adding, "I mean the time that he called at your office?" "That was about a month later" "And at that time what did you find?" was the next question the contusions had healed," was the reply I correct in stating that you, yourself, are not an orthopedic surgeon?" next inquired Mr Jones "I am not," stated the Doctor "However, your education includes a general knowledge of surgery, am I right in that?" asked the lawyer "Yes," replied the practicing physician let me ask you this question," said Mr Jones, "and I will ask you to follow it closely, and to wait before giving your answer till the Court has ruled on its competency" Then followed a long reading of a complicated hypothetical question It recited a robust boy, in normal health, walking briskly across the street, being struck by a

rapidly moving vehicle, thrown on his right side, thereafter suffering from severe shock, and being in a condition of semi-consciousness for some hours subsequent to the accident, found on examination the next day by a physician to be suffering from severe bruises on the right side, involving particularly the right thigh and right shoulder, with the underlying tissues severely damaged, the condition being such that the boy suffered severe pain, and was confined to his bed, for at least, two or three weeks, that when at the end of a month, the case was discharged by the family physician, he was still suffering from injury to the spine, with curvature and subsequently was treated by a specialist, that, after the accident, the boy had exhibited, and even at the present time, continues to exhibit irritability, nervousness and other symptoms of chronic traumatic spinal neurasthenia, etc., etc., etc, ending with the query "Assuming all of the above facts, can you state with reasonable certainty, the cause or causes of the various abnormalities manifested, as described?"

As always happens at the completion, the opposing lawyer was on his feet, objecting that the question was irrelevant and immaterial, containing facts not in evidence in the case, and, further, objecting to the form of the question, and so forth and so on When, with the aid, or at least with the assent, of the Court it had been specified, among other things, that no evidence had been submitted of a condition of chronic traumatic spinal neurasthenia, Mr Jones, addressing the Court, stated "If it please your honor, those portions of the question will be put in evidence through the testimony of a specialist, who will be the plaintiff's next witness. I am asking Dr. A the question, at this time, to expedite the trial, and conserve the time of the Court, and, as well, to avoid needlessly retaining Dr. A who is a busy practitioner, and has important cases awaiting his attention. I would respectfully ask that your honor permit the witness to answer the question at this time, subject to the introduction of this evidence, with the understanding that, if such testimony be not subsequently admitted, that this portion of the witness' testimony shall be stricken from the record, without objection on the part of the plaintiff

The opposing lawyer objected to this assumption of facts not in evidence. The procedure was irregular, and prejudicial to the interest of the defendants. The Court suggested that he specify his other objections, and that they take the time to argue upon the form of the hypothetical question.

When, after a considerable time, during which the practicing physician was thinking more of his neglected practice than of the legal technicalities under discussion, the question had been adjusted, the opposing lawyer withdrew his objection to its being answered at this time, reserving the right to move it be stricken from the record, if the plaintiff failed to supply the missing evidence, and Dr. A was instructed to answer "I can," was the reply "Will you so state," quickly followed "The accident and resulting injuries," said the practicing physician "In other words, Doctor, you wish to, and do state to the jury, that the accident, as described in the hypothetical question, under the conditions therein stated, was a competent producing cause of the results therein described" "Yes," was the reply "You may cross examine," and with these words Mr Jones, with an approving glance at the jury, resumed his seat

The cross examination was relatively brief, and was almost entirely directed to the hypothetical Had he seen any considerable number of cases of chronic traumatic spinal neuras-Answer "No" Had he ever seen a case prior to the one here under consideration? "No" Had he made the diagnosis of chronic traumatic spinal neurasthenia in the case of Jimmy Brown? Answer "No" Had he ever heard of the disease or condition of chronic traumatic spinal neurasthenia, prior to its being called to his attention in this case? Answer "He believed he had" Question "Where?" He believed he had seen it in medical literature Would he describe the condition of chronic traumatic spinal neurasthenia would say that the condition was characterized by a tendency to over excitability, and excessive fatigue, as a result of an injury involving the spine Had he observed this condition in Jimmy Brown? He had not So that from his own knowledge, he would not say that Jimmy Brown was suffering from the condition? Answer "No" Question "Yet you felt justified, in answer to the hypothetical question, to state that the condition was induced by the accident" Answer "Under the conditions—" The oppos-Answer "Under the conditions ing lawyer, interrupting—"Now, Doctor, never mind about any explanation. The question is perfectly plain and I must ask you to answer it yes or no" Answer "Yes"

"That is all," said the cross-examiner with a smile directed to his associate-counsel, evidently intended to show to the jury his feeling of triumph

Dr A moved as though to leave the stand when Mr Jones arose with "Just one minute, Doctor You are a general practicing physician and not a specialist in injury cases. Is that correct?" "Absolutely," replied our practicing physician "That is all," said Mr Jones "Stand aside," said the attendant "Call your next witness," said the Court, and Dr A dissatisfied disappointed and dismayed, left the stand, and taking his hat and coat, departed from the scene of his unhappy experience, as Mr Jones was announcing the name of another physician of whom he had never heard. It was 12 40 o'clock

The next morning the following appeared in the local daily

"LOSES SUIT FOR SON'S INJURIES

"The jury in the action of Mr James Brown against the XYZ Corporation, to recover damages for the alleged serious injuries sustained, a year and a half ago, by his son, James, who was hit by a heavy vehicle of the defendants', brought in a verdict, late yesterday afternoon, in favor of the defending corporation. The jury was out less than half an hour Dr A, of blank street, was the leading expert for the plaintiff Dr B, of somewhere else, also testified It seems that Judge J, before whom the case was tried, instructed the jury that it was their duty to decide whether the experts had testified intelligently, and without bias or whether they were influenced by venal motives The testimony of our esteemed citizen, Mr C, director of the YMCA gymnasium, that young Jimmy had, for the last year and a half, regularly attended the boys' classes, and had taken a leading part in all of the heavy exercises for boys of his age, without complaint or injury, is believed to have influenced the jury in reaching their verdict"

I have presented the incidents just described, not as anything unusual, but to picture ordinary occurrences which a practicing physician may experience. The picture may be erroneous in technical details—but that matters not. Every important incident is a statement of an actual occurrence. It is my purpose in bringing this subject before you, to stimulate a diagnosis of the causes of certain existing situations, that seem undesirable and unnecessary, in the relation of the practicing physician to court procedures, with the hope that, with these conditions in mind, you will be able, from time to time, to suggest appropriate remedies

Probably all agree that any class of individuals who are especially liable to be summoned to Court as witnesses, and particularly as expert witnesses, should have included in their education, some simple fundamental instruction on the rules of evidence, and the obligations and rights of an individual as a witness. Such instruction might either be given in a special course in premedical education, or be included in a course on medical jurisprudence as a part of the medical curriculum I do not doubt that in many instances physicians who have inadvertently become involved in a case, by reason of their services as a practicing physician, are qualified as experts without the knowledge that such qualification is optional with them, and that by refusing so to qualify, their examination may be limited to a mere statement of facts

Again, physicians as a rule understand in a general way that their relations to patients are confidential. Few, however, have any definite knowledge under what circumstances, and on

what occasions, they are at liberty, or even compelled to reveal information which they possess by reason of such confidential relations. To be sure, when on the witness stand, they are advised and protected by the Court, but in their relations to family and friends, and in their relations to lawyers in conference, under these and other circumstances, the occasion is always liable to arise where they are in need of authoritative information.

From time to time, I have discussed with individual members of the Society, the possibility of some plan to lessen the sacrifice of time imposed upon the practicing physician in the matter of court attendance. It would seem that this ought to be accomplished, not because it is a matter of his personal convenience, but primarily because it has to do with the efficiency of the service he is rendering the community even to the extent of its becoming a question of life or death

Nor can the practicing physician always foretell when a serious demand is made upon him It is because of this, that frequently he puts aside his personal convenience, sacrificing a social engagement, or leaving his bed in the middle of the night, more often, to be sure, to see a case of minor importance, but occasionally, and he knows not when, to treat an illness, so serious, as to demand immediate attention. Even the matter of his routine office practice, and outside calls, cannot be taken lightly. The failure of the physician to arrive in the home at the expected hour, may deprive him of the opportunity of a conference with the nurse going off duty, who has attended the case for twelve hours, so that he may learn details, the importance of which, he cannot anticipate, and are only appreciated by himself Or again, the failure to see a patient as expected, may, as physicians well know, result in unfavorable reactions in the patients themselves, who become excessively nervous, tending thereby to exacerbate the diseased condition. It not infrequently happens that conditions arise which require prompt changes in the medication, the digitalis should be stopped or increased, as the case may be Indeed, there are a multitude of situations that render it important not to interrupt the routine of the physician's practice, certainly not simply to render a service in some legal proceeding of relative unimportance hasn't to do with his duties as a physician, and so is not illustrative of the reasons for conserving the time of the practicing physicians which I have just put forward, nevertheless the following situation, with which I am personally familiar, well illustrates, I believe, the disparity in obligation and sacrifice that may be demanded in the matter of court attendance.

A physician friend of mine saw a case in consultation. Some time subsequently a suit was instituted against the attending physician. Unknown to my friend, the consultant, the case was

set for trial on the very date on which he was to be married, in Canada He was to be called as a witness No subpena had been served, as the family physician had assured his lawyer that the consultant would willingly step into the Courtroom and give his testimony whenever it was The conflict of dates came to the attention of the family physician's lawyer, on the very date that the consultant was obliged to leave for a distant city The lawyer at once issued a subpena, and attempted service, posting men in front of his house and office. The consultant did what I believe every man would expect him to do under the circumstances He evaded service, even at considerable sacrifice of his dignity, managed to land on the blind end of a baggage car immediately behind the engine, and arrived at his destination looking more like an Ethiopian than a Caucasian bridegroom Even if there be some question about the legal propriety of procedure in this case, there can be none on the need of conserving the time of the practicing physician in Court attendance on relatively unimportant

The introduction of testimony by deposition in civil actions would enable the practicing physician witness to select the time, which, in a measure, would clarify the situation, but I am told that this is untenable, since it would deprive the opponent of the right of cross-examination. This is not so with regard to testimony taken outside the jurisdiction of the Court, and I cannot appreciate why it need be so in the matter of testimony of practicing physicians within the jurisdiction of the Court Such deposition might be limited to testmony as to facts, excluding expert opinions I am informed that there is a provision already existing, under which a practicing physician is not obliged to recognize an ordinary subpena to testify in regard to services rendered a patient in a charitable institution, but is obliged to recognize a subpena signed by the Court, it being assumed that the Court will issue such a special subpena, only when he has convinced himself that the testimony of the practicing physician is of vital importance to the case. To what degree the extension of such a procedure to all minor civil actions would relieve the situation, I am not prepared to state It would seem as though much would depend on the idea of the Court as to what constituted "vital importance"

The subject of the hypothetical question with its "yes" or "no" answer is ever with us In our November meeting the speaker, Dr William A White, gave emphasis to the fact that in regard to mental conditions, the hypothetical question is based upon an archaic conception, in law, of what constitutes mental competency and responsibility, and that the "yes" or "no" answer may be entirely misleading. Hence it frequently follows that conscientious physicians of equal ability, and of equally wide experience, give opposite answers

because of the particular interpretation that they feel justified in putting upon the hypothetical question This is done to the confusion of the Court and jury, and brings discredit to the medical profession, which the witnesses honestly and honorably represent This misrepresentation of the facts in the case by an unqualified answer of medical questions, including the hypothetical question, is by no means limited to conditions of mental diseases, yet I state from my personal experience that I have, more than once, been enjoined by the Court to limit an answer to yes or no, without qualification, when, in justice to the truth, I should not be required to do so "Yes" or "no" may be half right, but even if it be minety percent right, the witness is not true to his oath who fails to testify as to the qualification necessary to justify his answer Practical considerations and matters of policy may make it desirable to omit such qualifications from the standpoint of a particular party in the issue, the qualifications may weaken the force of the answer, but if this be so, it is merely because the truth is less firmly established than the yes or no answer would seem to indicate

It has only recently been said that the foremost national problem that calls for solution in the year 1928 is concerned with the spirit of lawlessness that prevails Our courts are an institution to cope with this problem. Is it possible that this same spirit has crept into the Courts themselves, and that attorneys and witnesses alike, at times, become so zealous in the winning of decisions that they are not fully mindful of the high ideals of character which constituted the very foundations of our nation? My only purpose in raising this question is to importune the practicing physician to be mindful of his obligations to himself, as well as to the interests of his patient at law Lawlessness in a nation of culture and power is a sign of decadence, in an individual, it is a sign of weakness. It is of greater worth to be honest than clever, even for a practicing physician in Court

May I say a word in closing about the treatment of citizens at the hands of the Court, and the attendants. It is agreed that the Court is entitled to and should receive the fullest respect of all in attendance, no matter in what capacity, and, as well, of the community in which it has jurisdiction, and that this respect should be observed in every relation of individuals to the Court. To this end the Court is empowered with

authority, that, within its own jurisdiction is nearly if not quite absolute

This very fact, however, carries with it a reciprocal obligation, namely, that the Court shall so conduct itself as to be entitled to the respect which it demands Subjecting those who unwittingly offend in some relatively minor and perhaps even questionable particular, to unnecessary public indignities, does not, in the speaker's opinion, constitute conduct that inspires respect, even though it may constitute an exhibition of power that in-The delegation of power does not lessen but rather increases the obligation to maintain dignity of behavior, as well as of position If there be truth in the saying "once a gentleman always a gentleman," then it may well be expected that the Court shall not cease to be a gentleman in, the expectation that thereby it shall create respect

There is an angle of the attitude of the Court towards witnesses including, and perhaps more particularly, the expert witness, that we cannot escape considering In a jury trial, the Court renders decisions on matters of law, and the jury is given the responsibility of deciding on ques-There is perhaps the danger that tions of fact an inexperienced jury may be unduly influenced in reaching a decision by extrinsic factors, such as the personality or demeanor of witnesses Can it be that the Court, realizing this, in its discretion to lessen undue influences of this kind and avoid what it believes to be a miscarriage of justice, willfully humiliates, and in a measure, even discredits witnesses in the eyes of the jury? Whether or not this intent exists the conduct on the part of the Court as described, certainly at times must react in this way. If such, indeed, be the purpose of the Court, it would seem to be a questionable practice from the standpoint of the intent of our system of trial by jury, and unfair, as well as ungentlemanly, treatment of the decent witness who is the victim of such treatment

Fortunately, it is the exception rather than the rule for those who hold this high office to offend in this particular, and the practicing physician may expect to ordinarily receive courteous treatment from the Court. Nor should he fail to realize that the Court rightfully demands courteous and respectful treatment from him, even more than from citizens in general, because of his outstanding position, both in the Court and in the community

DISCUSSION

Judge Alfred E Ommen This is the most delicious and immitable paper I have heard in many a month and I wish that every member of the bar might have heard it. It is particularly opportune because at this time the Appellate Di-

vision and the Supreme Court are trying to eliminate some of the things Dr Moss referred to There is to be a special term of the court to investigate ambulance chasers and the utmost possible is being done to clear the calendar of much

of that sort of thing There are many things to be said on the subject of the young physician as an expert witness. In-so-far as the picture Dr. Moss has painted of that neophyte it is simply splendid. But there is another side to that picture and this is presented by the trained physician who is not so disturbed by his neglect of his patients and who is frequently seen in the courts, particularly in accident cases. He not infrequently has waiting for him, not sick patients but half a dozen cases in which he wishes to testify. That presents the other side of the picture

Regarding the treatment of people in the courts by the judges and attendants, I have always felt and I know the bar in general feels keenly this frequent lack of politeness and disagreeability, and if it depended on the bar it would be altered but we, unfortunately, have two conditions in connection with that Often a man goes on the bench with the idea that he has a call from God to dominate over his fellow men and he wants to indicate it definitely so he expresses himself Regarding the attendants, we have the very common situation that putting some men in a uniform and brass buttons and giving them a little authority makes them insufferably domineering I once appointed a man who at the club was quiet, anemic and far from strong as a court attendant and later found to my astonishment that he had become a roaring lion. That is the explanation for that We have had judges who were examples of courtesy and good manners These is probably not a lawyer here who does not remember Judge Leventhal, who whenever he entered the court room said "Good morning, gentlemen," to those present before taking his seat. He listened with attention to the attorneys and even when he differed with them did so cour-That could so easily be always done, but, unfortunately, is not the rule I was recently a fellow traveller on a cruise with a judge of the Court of Appeals and was glad of the opportunity to tell him how delightful it was to enter that court with its quiet, pleasant atmosphere, where one feels he will have full opportunity to present a case where all the facts in law will be carefully weighed

Much of the criticism of Dr Moss is sound but there is no reason why there should be cause As to the broad question of medical testimony, that would require a long time to discuss However, I may say that it would be impossible to have testimony taken by affidavit on one side. because that is too dangerous, there must be opportunity for cross-examination and the jury should have the right to look at the witness and decide if he is or is not telling the truth. How the time of the physician could be saved I do not know There are many lawyers at the bar today -who are discouraging litigation for reasons of delay, three years before a case is reached, three weeks of bringing witnesses day after day

waiting for the case to be tried until the witnesses rebel against coming at all, arriving at the court room and having the judge act in an unnecessarily severe manner in the conduct of the trial Consequently, many lawyers avoid litigation and turn it over to men who have nothing else to do but that For the average practicing lawyer with three to five trials a year it is better to turn these cases over to somebody else. He is, therefore, better off than the doctor who as a witness cannot turn the onus over to anyone else

I think this was a splendid paper and I close with what I said at the beginning, that I sincerely wish it could have been presented to every lawyer in New York because there are many things in the administration of justice that need changing

Edward Adams, MD I heartily enjoyed Dr Moss' paper which I am in a position to appreciate since I have many times appeared in court as a medico-legal expert. He has, however, merely scratched the surface, it would be impossible in one evening to cover the subject thoroughly I feel I am in position to amplify one or two reasons why the general practitioner does not want to go to court First there is the loss of time, due to postponements he is generally asked to go several times Secondly, many lawyers engaged in this work have some idea of medical terms and when they get a doctor on the witness stand who is not an expert they make him appear ridiculous. In other words, they "make a monkey out of him" I hope at some later time this year to take up this subject myself from the standpoint of the medico-legal expert, and tell you what he has to put up with as well as the general practitioner

Louis Cohn, Esq Due to the activity in negligence cases the internes in the hospitals have been educated as medical witnesses, not only by those lawyers soliciting the cases but by representatives of casualty companies and railroad companies We find that in many serious cases the medical witnesses are hospital attendants and when a person is brought in injured his case is recommended to a lawyer by someone connected with the hospital and the physician is interviewed in the hospital When the case comes to trial the doctor has a good idea of what is expected of him in the way of testimony The average practicing physician is seldom called to court, it is the physician associated with one side or the other that testifies and he is experienced in court The lawyers bring their own physicians and that is one of the evils in legal work in connection with expert testimony

Dr L W Zwisolm Dr Moss has by no means overdrawn the picture, the average medical practitioner who goes to court is subjected to just such indignities and lack of consideration as

Dr Moss outlined He is not treated as a specially qualified man, on the contrary, as Dr Adams said, there seems to be a special effort made to "make a monkey" of him by one side or the other There are medical men whose standing is so high that no one dares subject them to ridicule, Professor Loomis was such a man But the average practitioner, called to testify in a case he has treated at the time of the original injury, is freely bullied and badgered in an effort to make his testimony seem worthless in the eyes of the judge and jury

Dr William Stemach Dr Moss' picture was very well drawn But there is a way to discourage litigation in trivial injuries and that is by the expert insisting on being paid before entering the court. The lawyer has everything to gain, on the 50-50 basis, and he expects the doctor to go to court on the understanding that he will be paid if the case is won. If they lose they pay nobody. The lawyers handling these accident cases on a contingent fee basis have a bad reputa-

tion as to paying If the doctor insists that someone of responsibility be compelled to pay him, or that he be paid in advance, most of the lawyers would hesitate to bring him to court and the case would be dropped

Dr Moss (closing the discussion) I had in mind in writing this paper, and I have had enough experience to know, that our friends in the legal profession often say a thing cannot be done and then they settle down to work and prove that it really can be done That was illustrated in creating the Grievance Committee of the medical profession in this State and now operating When the Grievance Committee was first mentioned to the Board of Trustees of this Society, the lawyers on the Board were unanimous in declaring it was impossible to create such an organization, it could not be done Then some of them got their heads together and accomplished it When I hear lawyers say a thing cannot be done, I know it means

PHYSICAL MEASURES IN GENERAL PRACTICE* II Ultra-violet radiations and mechanical measures By RICHARD KOVACS, MD, NEW YORK, NY

PHOTOCHEMICAL MEASURES The application of electromagnetic radiations for the treatment of disease or the stimulation of lagging biologic processes forms one of the most interesting chapters of modern physical therapy. A maze of clinical and experimental material is still accumulating, so that only some of the most important facts, those of practical application, can here be presented.

Physics A table by Coblentz presents a summary of the physical and biological characteristics of the principal regions of the electromagnetic spectrum The physical difference between these regions depends on the wave lengths as well as on intensity at the source Wave lengths usually are expressed in Angstrom units, representing onetenth of a millimicron, Coblentz, however, uses the millimicron (or millionth of a millimeter) so his figures have to be multiplied by ten erally speaking, electromagnetic radiations, to be considered here, can be divided into five main groups the far infra-red $(15,000 \text{ to } 150,000 \text{ A}^{\circ})$, the near infra-red (7,600 to 15,000A°), the visible spectrum (3,900 to 7,600 A°), the near ultraviolet (2,900 to 3,650 A°), the far ultraviolet (1,800 to 2,900A°) Below this range are the still longer Hertzian waves used in wireless telegraphy and radio, above, the still shorter X-Rays and radium emanations

Summarizing the different spectral regions the probable depth of penetration and the probable physiological action of the 1835 from different sources

Spectral region	Penetration of rays	Physiologic action	Source		
Far ultraviolet, 180° to 290° mis	Superficial 01 to 03 mm	Photochemical	Metals in car bon are and spark of met als (mercury		
Near ultravio let, 290° to 365° mu	Superficial, 03 to 05 mm	Photochemical	sun. Metals in carbon are and are of metals		
Visible spec trum 390° to 760° mu	Superficial 05 to 5 mm	Thermal, nerve stimulation	Sun. Carbon arc		
Near infrared, 760° to 1500°	Deep 10 to 30 mm	Thermal nerve stimulation	Sun Carbon arc. Gasfilled tungaten lamp		
Far infrared 1500° to 15000° mu	Superficial 3 to 0.1 mm	Thermal nerve stimulation	Carbon arc In frared (radi ant) heaters		

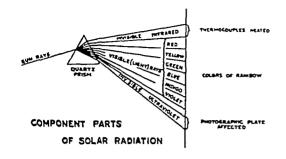

FIGURE I

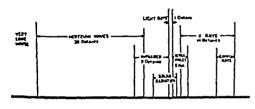

Summary of physical and biological characteristics of the principal areas of the electromagnetic spectrum (after Coblentz)

The second table shows the relative position and extent of the various waves, which cover a range of 62 octaves. Of interest in this table is the fact that light rays—those affecting the retina—form only a very small proportion of the total waves of the spectrum. With the physiological action of the visible rays still undetermined, it is difficult to retain "light therapy" as an adequate expression to signify the therapeutics of all of the vast ranges of the electromagnetic spectrum. Various sources of electromagnetic energy emit radiations with a

^{*}Part of a course of lectures on Physical Therapy arranged by the Committee on Public Health and Medical Education of the Medical Society of the State of New York, given before the Columbia County Medical Society, and also read in part before the Kings Oncens and Nassau County Medical Societies and the Medical Association of Greater New York, in the Spring of 1928

varying quality and intensity of the different wave lengths. When we consider that up to very recent times there was no detailed information available

The component parts of light and the electromagnetic spectrum

for comparison of the output of these sources and that there are likewise not enough definite data available as to the specific therapeutic effect of the different wave lengths of both the visible and invisible spectrum, we understand why the present status of light therapy is mainly empirical Various types of apparatus emit a varying quality and quantity of thermal, luminous, near and far ultraviolet rays, and even those who maintain that a generator that would give a true reproduction of the sun's rays is the ideal one for light therapy would be embarrassed to state what kind of natural sunlight they consider best. For the analysis of natural sunshine shows a considerable difference in summer and winter, at high noon and in the morning, in low and in high altitudes, in the tropics and in our latitude, and even within the same latitude in different parts of the world

Thermal vs Photochemical Radiations We must emphasize the fact that all of the generators of ultraviolet rays produce a varying amount of heat and light rays so that, to attribute almost all of the vitalizing effects to the ultraviolet part of electromagnetic radiations, would be an exaggeration. The tremendous energies of the lower spectral ranges are at least as essential for all organic life, as proven by the fact that flowers thrive in glass houses at all times in spite of the absence of ultraviolet rays—which are arrested by ordinary window glass. Thermal rays penetrate subcutaneous tissues, heat the blood, accelerate vital reactions and act instantaneously, they produce a burning sensation or immediate burn when their

intensity is too great. Ultraviolet rays penetrate only to fractions of millimeters, they are absorbed by protoplasm and this absorption results in physical and biological changes which manifest themselves only several hours after exposure Generally speaking, we apply thermal radiations more for their immediate local effects and ultraviolet radiations more for their remote effects on the general organism

Short and Long Ultraviolet The "Vital" The fact that within the ultraviolet field there is a very marked difference between the biological action of the various wave lengths adds another source of complication for the proper conception of its action. We know in a general way that the short rays are more bactericidal and the long ones promote nutrition, we also know that in the long ultraviolet spectrum the band from 2900 to 3200 Angström units (nearest to the short rays) is the most effective for the prevention and cure of rickets. This portion has been named the "vital" range, and based upon the experimental findings in rickets, ultraviolet enthusiasts are apt to lay too much emphasis on this particular portion of the spectrum The short (far) ultraviolet

rays penetrate the skin to only about one-tenth of a millimeter, while the long (near) ones penetrate from three-tenths to one-half of a millimeter. The sun's spectrum contains none of the short ultraviolet, the noon summer sunlight contains the antirachitic zone, but the winter sun contains very little of it, and even this is likely to be

filtered out by the impurities of the atmosphere Ordinary window glass does not transmit the vital rays The various sources of artificial ultraviolet, the mercury vapor lamp, the carbon arcs of varying impregnation and under varying electrical activation, contain a varying admixture of the far and near ultraviolet, as shown in two tables, one by Coblentz and one by Goodman and Anderson

FIGURE 4

Ultraviolet emissions from various sources, measured forty inches from the source (after Goodman and Anderson)

Physiological Action and its explanation General Effect Ultraviolet rays exert (1) a rapid germicidal action to which bacteria are more uniformly sensitive than to chemical agents and (2) They cause after a well-defined and as yet unexplained latent period, a marked erythema of the skin, which is accompanied by a marked dilatation of the superficial capillaries and is followed by desquamation and pigmentation This erythema varies considerably with the personal idiosyncrasy of the patient (3) They cause an increase of the red blood cells, the blood platelets and the white blood cells—the latter increase being mainly lymphocytic in type—and also an increase of the calcium, inorganic phosphorous, iron and rodine content of the blood, and evidently produce an active change in the blood stream which is preventative or curative of rickets. According to latest investigations, there is also a decrease in blood coagulation time

Beside the objective and laboratory effects, in many instances there also appear subjective changes consisting of an analgesic effect in painful areas and a general feeling of buoyancy and well-being When there has been an overdose of radiation or the individual is particularly sensi-

tive, there may follow drowsiness, malaise, lasting several days These symptoms are usually met with in patients with low systolic and diastolic pressure, and may follow what would appear a perfectly safe dosage

The explanation of these actions is still under 1udgment The bactericidal action and tissue change may be due to some change in the protoplasm of cells, and is especially marked following exposure to the shorter (far) ultraviolet rays The longer ultraviolet rays may penetrate in part to the cutaneous capillaries and so directly affect the blood, although it appears that more of the action on the blood is indirect. Direct action can take place upon the nerve endings of the skin, and this may reflexly affect the depths. The influence on rickets has been explained by (1) an equalization of the disturbed ratio between calcium and phosporus, (2) by an activation of the light sensitive cholesterol in the skin, (3) by an increase in vitamin D There is also claimed an increased activity of endocrines under ultraviolet and an undoubted increase in general metabolism. The combined application of photochemical and thermal radiations can increase oxidation and reduction, and in systematic application of heliotherapy the climatic factors of outdoor exposure undoubtedly play an important additional part in the action on metabolism Pigmentation or tanning is by many considered an index of the powers of resistance of the patient, and its intensity taken as an aid in prognosis and in determining the relative value of ultraviolet radiation

(b) Local Effect The local effect of ultraviolet rays ranges from mild skin erythema to complete destruction of albumin The founder of ultraviolet therapy, Finsen, led the rays of a powerful carbon arc through a telescopic system of lenses which concentrated the light while circulating cold water simultaneously filtered out the heat rays The "cold" ultraviolet applied through quartz lens compression to the diseased areas causes an intensive local inflammatory reaction which leads to the clearing up of the lesion modern "water cooled" mercury vapor lamps with quartz rods attached furnish a simple technic for the application of cold ultraviolet directly to the skin and mucous orifices. For the purposes of the general practitioner we have to consider the general ultraviolet radiations only

Therapeutic Uses Fairly consistent clinical experience enables us to state that general ultraviolet irradiations are beneficial (1) in all forms of surgical tuberculosis, such as tuberculosis of the glands, intestines, peritoneum, bones and joints, as well as of the skin, also in some chronic forms of pulmonary tuberculosis "Open" forms of tuberculosis respond not as well as closed ones (2) In all forms of malnutration in children rickets, marasmus, restless, nervous, anemic and rheumatic children, madequate increase in growth

and weight, spasmophilia or tetany

In these two groups of conditions the action of general ultraviolet radiation may be called specific

Ultraviolet rays may act as an important adjuvant in the following conditions all forms of secondary anemia, general debility, convalescence (especially after infectious diseases and operations), repeated colds and other respiratory diseases, asthma and hay fever, mucous colitis

Local irradiations act powerfully in a wide range of chronic skin diseases and infections, in pyorrhea, burns, pruritus ani. It has been the experience that the results of local treatment of any tuberculous or other lesion will be considerably enhanced if systematic general exposures are applied simultaneously.

Contra-indications In very active or progressive forms of pulmonary tuberculosis, especially those accompanied by high fever, both heliotherapy or artificial light therapy may cause a fatal flare up similar to a strong tuberculin injection. Advanced heart disease, severe arteriosclerosis, extreme nervous irritability, renal insufficiency are further contraindications. In febrile cases in patients with low blood pressure, or patients showing depression instead of a feeling of well-being after irradiation, and those with abnormal sensitivity of the skin, great care must be used in determining subminimal doses to which these types will still respond favorably

There is considerable danger in the indiscriminate employment of ultraviolet generators by the unskilled in private homes, as pointed out in a recent editorial of the American Medical Association Journal. The tonic effect often ceases after a certain period and a constant control of the weight and blood picture is necessary. It is interesting to know that children can stand relatively larger doses than adults. The increased sensitiveness of blonds and those of light pigment is well known. Cases of acute eczema and derinatitis with blister formation seem to get worse under ultraviolet.

Heliotherapy Sunlight consists of 7 per cent ultraviolet (of the longer rays), 13 per cent light, and 80 per cent infra-red rays Regulated solar irradiation produces objectively hyperaemia of the skin, later pigmentation, increase of tonus of skin and muscles, and improvement in the blood picture, subjectively a pleasant sensation of warmth, lessening of pain and fatigue, and increased appetite. Local tuberculous lesions undergo progressive favorable changes, especially if the treatment is combined with suitable immobilization and extension in orthopedic cases

The general practitioner should get acquainted with the simple technic of heliotherapy, a knowledge readily acquired, because in summer curative insolation can be successfully applied in high and low altitudes alike. (See Rolliers chart.) At the seaside diffuse light is intensive and rich in ultraviolet rays, and even increased when the sky is

covered with light clouds The winter sun is poor in effective ultraviolet, except in high altitudes

Transparent Window Glass The present widely advertised ultraviolet transparent window glasses do not provide sunlight when there is none. The sky radiation from the north contains little efficient ultraviolet The sun's rays passing

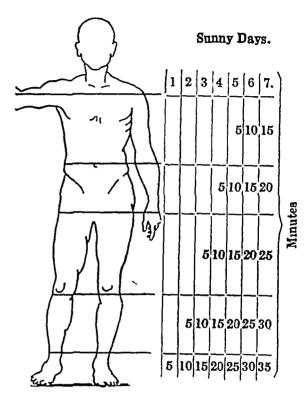

FIGURE 5
Diagrammatic chart of exposure to heliotherapy (after Rollier)

Diagramatic Course of Sun Cure.—According to the individual reaction, the daily dose may be doubled or tripled.

The dorsal surface of the body is treated in a similar manner wherever permitted by localization

The insolation continues progressively beyond the seventh day, so that a maximum duration of two to four hours is reached

After the third week one may proceed to a full sun bath. Neck and head lesions may be exposed to the sun only after a previous preparatory irradiation of the rest of the body.

through these glasses will not exert any appreciable influence unless they reach a large surface of the bare skin. It has been proven that transparent window glasses deteriorate even quicker than the quartz containers of the mercury vapor lamps, and so after a while transmit only a fraction of the sun's ultraviolet. Their use, therefore, can be considered really beneficial only in special solaria and sun-parlors with southern exposure,

where patients can be exposed, fully or partly uncovered with their bodies protected from cold

Artificial light sources furnish a much more desirable and convenient substitute for the sun's rays and those mainly used in this country are the carbon arc and mercury arc in quartz

Carbon Arc Lamps An electrical current passing between two carbon rods forms an arc which produces an intensive illumination. The spectral composition of this radiation is very near to that of the sun, especially in regard to the near ultraviolet rays The intensity of emission and its composition is determined by (1) the input of electrical energy (amperage), (2) the size of carbons. (3) the purity of carbons or their impregnation by metallic salts At the Finsen Institute in Copenhagen, where carbon are therapy originated, it is stated that because the carbon arc emits more of the long wave, deeply penetrating ultraviolet rays, its therapeutic action as a tonic is far superior to that of the mercury vapor lamp The carbon arcs emit a great deal of the thermal rays, and patients seem to enjoy the warmer rays of the carbon arc more than the relatively cold rays of the mercury vapor lamp

The advantages of the carbon arc lamps are (1) that there is no waiting in starting treatment, as the arc at once emits the full spectrum, (2) that the rays are of constant composition, not influenced by deterioration of the quartz burner, (3) that carbons are quickly and cheaply replaced, (4) that by using cored carbons of different composition a variety of spectral bands and therapeutic effects can be produced, (5) that carbon arc lamps are much less expensive. Some of the drawbacks of the carbon arcs are (1) the carbon arc often sputters, produces ashes, and the carbons need adjusting and replacing, (2) long exposures are necessary, on account of the lesser amount of ultraviolet rays-four or five times as long as with the mercury vapor lamp, (3) the larger carbon arcs (consuming over 20 amperes) require special wiring and consume a considerable amount of current

In spite of these minor drawbacks, the small 15 to 20 ampere carbon lamp constitutes an effective and relatively inexpensive addition to the equipment of the general practitioner. The technic of application is simple exposure to the entire body at a distance of about three feet, beginning with ten to fifteen minute periods, divided between the front and the back, and working up to those of one hour or more. With the B carbon of the National Carbon Company, which furnishes a radiation rich in short ultraviolet, erythema and pigmentation can be produced as fast as with the mercury vapor lamp.

Mercury Vapor Lamps Pure mercury vaporized in the vacuum of a quartz container by the passing of an electrical current, emits a radiation very rich in ultraviolet, especially of the short wave lengths A few minutes radiation with one

of these "air-cooled" lamps may produce an inten sive sunburn, so that short and effective treatments can be applied in all cases where ultraviolet radiation is indicated Their efficacy and simplicity of handling has hitherto made the mercury vapor lamps the more popular in the United Compared with the carbon are lamps, they require much less current and their burners if properly cared for last for years. Their ultraviolet output, however rapidly decreases at the beginning, due to deterioration of the quartz, but then remains fairly constant for a long period Mercury vapor lamps are rather expensive on initial cost, and the replacing of a burner may cost nearly a hundred dollars, compared to twenty-five cents for a pair of carbons There is no question that both types of lamps have their distinct place in therapy and, with the extended clinical and experimental work going on with both, more definite statements as to their relative value and indications can be made before long

In the present stage of our knowledge there is no definite measurement of ultraviolet radiation possible, and dosage therefore is entirely empirical, depending upon the clinical effects of erythema production. According to the age of the burner in mercury vapor lamps and the sensitiveness of the patient, a varying length and distance of exposure is necessary. Aside from these factors, a fairly accurate technic has been developed and can be acquired without much difficulty

MECHANICAL MEASURES

Mechanical measures are applied (1) for their local effect such as improving the circulation, removing the immediate effects of trauma-hemorrhage, exudation and muscle spasm-or its remote effects-adhesions and stiffness (2) for their reflex action on remote nerve centers producing a multitude of general effects Mechanical measures used in modern physical therapy comprise massage, mechanical vibration, the static wave current and certain forms of low tension interrupted, wave and alternating currents, these currents acting primarily through electrochemical stimulation and their effects is restricted chiefly to muscular tissue Active and passive exercises are properly classified under mechanical also measures

Massage Massage is the oldest form of mechanical application to the body, and has the advantage of that it requires only a pair of skilled hands and a trained head, and with such can be applied at any place. It acts principally through aiding the circulation by speeding up the venous return and increasing the movement of the lymph. It also exerts a mechanical effect by stretching such type of fibrous tissue as the yellow elastic that can be broken down mechanically. Contrary to popular belief, massage does not cause an active hyperemia, as do the thermal measures, though by friction it exercises a gently warming effect.

There is modern experimental evidence to prove that massage is of only very slight benefit in preventing atrophy in paralyzed muscles. In paralysis only the lightest form of massage is indicated, because owing to the atrophy of the muscle, pressure may be transmitted to blood vessels, causing paralytic dilatation. In muscles which are not paralyzed, but have remained passive for weeks, the refreshing, stroking and invigorating effect of massage helps to restore muscle strength, by reviving the power of spontaneous action.

The second important action of massage is its reflex influence through skin stimulation. It relaxes spasm, influences general metabolism, and often aids promptly in run down nervous conditions. Disorders of the digestive system, atomic dyspepsia, some forms of chronic constipation, visceroptosis respond to skilfully applied massage.

Physicians should learn how to apply massage themselves or at least when and how to prescribe it. To tell the patient to go and get some massage or some electricity is equivalent to an instruction to go to the drugstore to get "some" medicine "Baking and massage" is an incorrect label for the often wholesale and slipshod work done under the guise of physiotherapy by some insurance concerns. Insured workmen are entitled to the best aid that modern methods of physical therapy can furnish and not to perfunctory rubbings. Massage usually works to best advantage when properly combined with other physical measures such

as preliminary deep or superficial heating and subsequent active or passive exercise or electrical muscle stimulation

Massage is contraindicated in acute inflammation conditions, infectious processes, neoplasms. The training of massage operators should be done under the auspices of hospitals and by medical men, and their licensing and supervision considered a function of the health department and not a police measure. The profession of a massage operator should be considered a noble one, just like nursing and be practised by persons trained thoroughly in its art and science and in the proper conception of medical ethics.

Mechanical Vibration consists of a series of strokes applied to the tissues through a vibrating attachment activated by a small electric motor. It exerts effects in many respects identical to massage it increases circulation, tones up arterial coats and muscular structures, relieves passive congestion and aids in removing inflammatory products. Properly used therefore a small vibrator furnishes a potent therapeutic measure and once the physician learns how to vary the action of mild and powerful stimulation, he can use it to advantage in combination with massage or electrical muscle and tissue stimulation or as a partial substitute for these

There is also a reflex action of vibration of which a great deal has been written and of which little has been accepted and practiced by the pro-

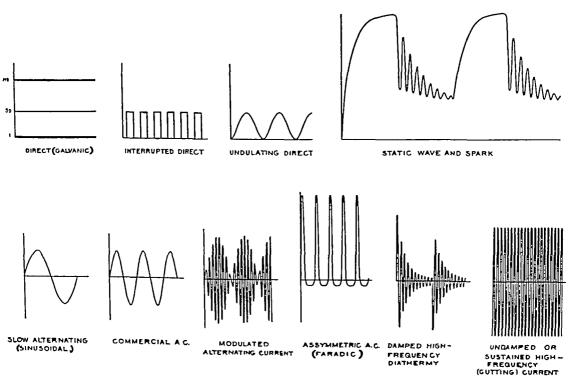

FIGURE 6
Graphs of the various forms of therapeutic currents

fession in general. Vibratory stimulation of the spinal nerve centers seems to exert powerful influence in the regions controlled by these centers

Muscle and tissue stimulation by electricity Classification of currents in electrotherapy, as shown in the attached chart, is done in direct relation to their action on the human body directional electrical currents flowing constantly with no change in intensity exert a purely biochemical effect, according to their polarity, but when applied or broken abruptly or varied in strength, increasing sensory stimulation and marked response of muscular tissue occurs mechanical effect is due to chemical changes and varies according to the voltage, amperage, frequency and suddenness of impulse. The unlimited number of varieties possible by these forms of alternating and wave currents offer a wide range for the stimulation of muscular and other tissues of the body When the interruptions or alternations of the current traversing the human tissues, however, rise above 10,000 per second-high frequency currents—the resultant electro-chemical response is nil, due to the extreme brevity of each impulse and hence the demonstrable effect of these currents is merely a production of heat due to the resistance of the conducting tissues The therapeutic application of heat-producing currents has been described under diatheramy

The time honored faradic current produces tetanic contractions of muscles with an intact nerve supply, and in its original form is quite painful and impleasant, it is therefore being used only as a diagnostic measure. By modifying this current to a pleasantly tolerable surging form it can be used advantageously for actively exercising weak and flabby but not paralyzed muscles, reduce obesity improve atony of abdominal muscles. There are mexpensive pieces of portable apparatus—such as the Bristow coil—available which enable us to apply it at the bedside, after fractures,

in atonic conditions, etc. The galvanic current, when flowing steadily, does not cause muscular contractions, but when broken or made suddenly it causes a brisk response in normal and a sluggish worm-like contraction in paralyzed muscles The lack of faradic response and the sluggish response to interrupted galvanism constitute the "reaction of degeneration" This is the most important electro-diagnostic evidence of a lesion either in the anterior horns of the spinal cord-such as infantile paralysisor of severe traumatism, or toxic degeneration of a peripheral nerve However, contrary to a formei widespread belief, the reaction of degeneration does not always signify an irreparable lesion but sumply denotes that the final recovery will require a considerable period of time-several months or longer in the majority of cases

Testing for the reaction of degeneration enables the rendering of an almost always accurate verdict from the standpoint of diagnosis prognosis and therapy in any case of paralysis following in jury or disease. It requires only a simple and in expensive apparatus—a galvanic and faradic outfit—and enables the skilled physician to testify as an expert in cases of paralysis and pseudoparalysis in industrial injuries and other accident claims

Interrupted galvanic currents, or slowly or rapidly alternating sinusoidal currents, induce graduated contractions in paralyzed muscles which cannot be produced by any other form of physical therapy. Such treatment preserves the deficient function of contraction until the muscle regains its lost connection with its spinal center Electrical stimulation also enables us to exercise any individual muscle without moving the joints it pon which it acts, and without putting any strain on the patient. These treatments, however, require anatomical and technical knowledge as well as equipment which is usually beyond the scope of

the ordinary practitioner The static wave current Some thirty years ago, static machines were greatly in vogue, but being mainly used for general tonic effects and for psychic conditions they were superseded by much more effective methods, and the large cumbersome static machines were gradually relegated to the scrap heap The war-time impetus of the successful application of the static modalities in the treatment of traumatic conditions through me chanical action, has brought on a revival and a proper appreciation of the static machines, which is best proven by the fact that institutions and specialists in physical therapy have practically bought up all the available old machines action of the static wave current consists of a discharge of a current of very high ten-ion but of infinitesimal volume, producing by its mere impact, powerful tissue vibration and active contraction of all contractile tissues under the electrode It is indicated for the relief of local congestion with pain and dysfunction as in all acute traumatism and in chronic inflammatory conditions without infection. Static sparks produce sudden, powerful contraction of tissues, breaking up adhesions, relieving muscle spasm and affecting deep seated congestions, peri-arthritic conditions, especially of the spine, beyond the reach of The static brush discharge may be deecribed as a nebulised spark and is relieving local induration and pain in an effective and painless manner

The static machine thus, when properly understood and utilized forms a very valuable part in the armamentarium of physical therapeutists, but it is unlikely that it will ever come back in the hands of the general practitioner

Therapeutic Evercise The general practitioner should have a working knowledge of the value of exercise for both local and general conditions

Local exercise is valuable in increasing the range of motion of joints and redeveloping muscle power after all forms of traumatism, sprains,

fractures, chronic inflammatory conditions, hemiplegias, paralysis and deformities

General exercise is indicated in conditions due to sedentary habits, such as constipation, enteroptosis, in neurasthenia, hysteria, gastric or intentinal neurosis, compensated valvular or myocardial lesions, some forms of hyper- and hypotension

Exercise can be classified as active, passive and resistive and its proper execution naturally requires training and skill The tendency is now to omit the use of apparatus as much as possible, or use only apparatus of very simple constructions, free and active exercises are most valuable for general conditions Every physician should be able to prescribe at least some breathing, abdominal, weak foot and setting up exercises Local exercises should always be taken after preliminary preparation of the parts by thermal or mechanical agents

Physical therapy when applied with proper indications and with proper technic will benefit a wide range of conditions, embracing the entire It behooves the field of medicine and surgery practicing physician to be familiar not only with the theory and indications, but also with the practical application of the principal physical meas-The general public demands physical therapy nowadays because it feels instinctively that it includes real therapeutic values quately trained lay people are only too willing to give the public what it wants The present leaders in medical teaching are still likely to be indifferent towards physical therapy because its development to an independent and so very promising science took place after they had finished their clinical studies Research work covering the entire field of physical therapy should go on, theoretical and practical courses for both students and practitioners of medicine must be established in all teaching centers and physical therapy departments, properly equipped and under competent medical leadership, should be part of every hospital—only thus can this most important part of modern therapeutics, which is entitled to be on equal status with pharmacotherapy, serve to the fullest advantage of the public and the medical profession

THE SURGEON—A POEM By LOUISE BARBER HOGG

The following verses were submitted by Dr by the author, while she was convalescing after I Richard Kevin to whom they were dedicated a successful operation for appendicitis

> God bless the surgeon whose wonderful hand Brings health to the sick, throughout the land Who waits at the portal of death, and saves Countless souls from the onrushing waves Calm and poised at his work he stands With the thread of a human life in his hands, With minute knowledge and perfect skill, He bends to his task of curing the ill There's no greater gift that God could give. Than men who can make the dving live

REMARKS ON SOME OF THE MORE COMMON SKIN DISEASES*

By ALBERT M CRANCE, MD, GENEVA, NEW YORK

THE study of dermatology is based principally upon what one sees upon careful observation. It must necessarily cover the location, size, character, both gross and minute, description of the lesion or lesions. In each of the many hundreds of skin diseases there are innumerable characteristics upon which we base our diagnosis and likewise our treatment.

It is therefore impossible, in this paper to go into details of each or even several of the many dermatological conditions At best we can only cover a few, and I believe that by spending the time on some of the more common skin diseases that you will take home more food for thought than if we try to cover too much of the subject which might result in a jumbled up mess If the physician in general practice understands the chief outstanding features of such common conditions as eczema. epidermophytosis, psoriasis, ringworm, impetigo, scabies, urticaria, herpes zoster and syphilis he will save himself the embarrassment of failure in curing the condition, because today, in dermatology, there are more specific treatments for the various diseases than there are perhaps in any other specialty of medicine

And furthermore, these specific prescriptions do not seem to work well in other conditions except for which they were intended. In fact,

Fig 1

Chronic ecsema of the hands in an elderly lady due to constant irritation from soap and water

it often happens that skin conditions are made worse by the application of wrong treatment

*Read, in connection with lantern elide demonstration at the meeting of the Ontario County Medical Society, held at Canandaigua, New York, January 10 1928.

Take eczema, for instance, which is sometimes diagnosed as scabies in its acute itching stage, sulphur ointment is prescribed, which of course

Fig 2

Serpigmous syphilide in the palm (unilateral) occurring in a voung man. Had treated for four years with various diagnoses such as eczenia, psoriasis, ringworm, etc. Disappeared immediately upon treatment with arsphene nume.

might be compared to trying to put out a fire by pouring kerosene upon it The result is obvious Eczema needs a soothing application and lots of oil, rather than soap and water It also responds quickly to quartz light treatment Eczema of course, is the most common skin disease, but a great many casse are called eczema, which, in reality, are not eczema at Eczema has many forms or types see it in acute and chronic forms, both of which have several types, namely, vesicular eczema, papular eczema and squamous eczema latter form or type is more apt to be found in chronic cases and as a rule requires considerable time in getting results. If we picture eczema as a whole as being due to some irritation from either within or without the body, and more often without, we will be more apt to use better judgment in our treatment of this stubborn affection

Epidermophytosis in its occurrence is quite as common as eczema and at times it is almost more common than eczema. In fact, a large number of cases are treated today as eczema, when in reality, they are cases of epidermophytosis Several years ago many cases were treated for eczema which were not eczema at The disease is due to a fungus and the afall fection is closely associated with that of ringworm although epidermophytosis does not by any means produce ringworm lesions primary lesion of epidermophytosis can very frequently be found between the toes, such as fissuring or scaling, or even crusty lesions is also commonly found in the perineal region and between the folds about the buttocks. It is also very common on the forearms and hands, especially on and between the fingers

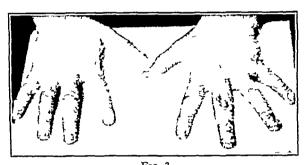

Fig 3

Typical epidermophytosis in a boy (Previously treated as eczema with no result)

The lesions, when occurring in the folds of the skin are usually of a moist character. When it occurs in other regions it is more apt to be dry and scaly with a slightly raised and discolored border. The center of the lesion does not seem to assume a healthy appearance as we find in true ringworm. The treatment is the same as that of ringworm which will be described under that heading. It is not uncommon to see cases of epidermophytosis which have been treated for weeks and months.

Fig 4
Typical interdigital epidermophytosis which disappeared entirely after two weeks treatment. This man also had been treated for several months for eczema

for eczema without results, completely disappear in a few days when treated correctly

Psoriasis is also a very common disease, and its treatment is still a matter for considerable argument. If we but knew the cause of psori-

Fig 5
Typical psoriasis lesions in a girl of 19

asis we might be able to treat it more specifically. The diagnosis of psoriasis first of all depends upon the lesion itself with its red base

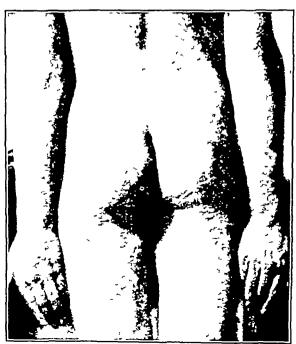

Fig 6
Universal psoriasis in a boy of 13

and white silvery scales which when removed may produce superficial hemorrhage, together with the fact that the lesions are usually found on the extensor surfaces near the elbows and knees, as well as on the body and in the scalp Psoriasis is a recurring disease and as a rule presents the above symptoms. Up to the pres-

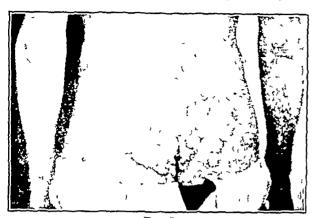

Fig 7
Psoriasis illustrating large gyrate figures on the extensor surfaces of the forearm and on the buttocks

ent time psoriasis may be called a controllable disease, but not curable. It can be controlled by the application of quartz rays or x-rays if

Early lessons of herpes easter (Note how the lessons begin at the midime)

we are careful to not over-treat the skin and also by the injections of inactivated autohemic serum. A diet free from milk or any products of milk has been suggested by Schamberg as being very helpful. Arsenic in my experience has never helped psoriasis. It may be entirely cleared up and will sometimes remain so for from six months to a year, and in some cases

longer Ointments in psoriasis do very little good except to help remove the scales The

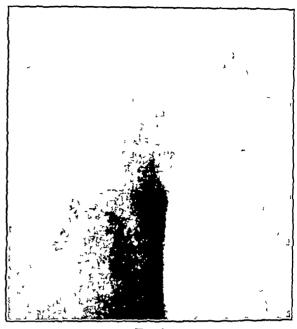

Fig 9

Annular lesson of tertiary syphilis on the left buttocks of a young man (Previously treated for ringworm)

new gold treatment which was reported by Tooiney in the December 1927 Urologic and Cutaneous Review sounds very encouraging for a better treatment of psoriasis

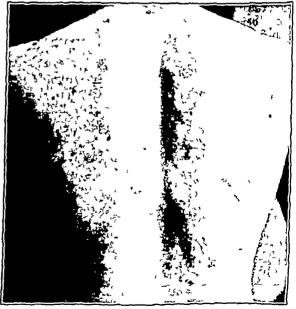

Fig 10
Acne vulgaris

Ringworm is among the common skin diseases and is due to a fungus. Its location

may be most any place. It may itch but slightly or the itching may be severe. Strange as it may seem, ringworm frequently is diagnosed as eczema. Primary lesions of ringworm are often found between the toes and many

Fig. 11
Ringworm of the scalp

Fig 12
Two large ringworm lesions in the scalp

of the cases with cracking and rawness and severe itching between the toes are nothing more than ringworm. The disease is also very common in the perineum and sometimes to a very severe degree. Some of these so-called cases of chaffing are ringworm, although not all Ringworm usually presents a slightly raised border and a healthy center. The specific treatment of ringworm is a simple one. The parts should be soaked at least once or twice a day in a one to four thousand solution of potassium permanganate. Every other night Whitfield's ointment should be used, which is made up as follows ac salicyl 30 Ac Benzoic 60 Lanolin 150 Petrolat qs ad 600

Impetigo is undoubtedly more common in children and is highly contagious, as its name implies. It is more of a crusty disease than it is a scaly one. Dr. Wende used to have a very characteristic way of describing the appearance of impetigo. He resembled it to a

Fig 13
Proriasis patch occurring in the palm of the hand

hunk of mud which had been thrown against the side of a building and stuck there. This describes very strikingly the appearance of impetigo. Its location is usually about the mouth chin nostrils, face, cheeks and nose, and at times on the hands. Impetigo is curable in forty-eight hours by the following treatment. The crusts should be softened by tincture of green soap and then allowed to dry for five minutes. This is followed by the application of amoniated mercury ointment 15 to 20%. This procedure should be done twice daily

Scabies continues to be a rather common

skin disease, and yet, this spring the writer saw a man with universal scabies who had been treated for six weeks by a physician for a rash due to "some acid condition of the stomach" It was a very severe case of scabies and yet was practically all cleared up in three or four days by the use of soap suds and two baths daily

Fig 14

A case of universal scabies which had been treated internally for six weeks for some "acid condition of the stomach"

and the application of sulphur ointment at night. It must also be remembered that scabies is due to an animal parasite which will live in underclothing, bed sheets and night clothing and that a very important part of the treatment is to boil or iron with a hot iron each garment after it is removed. This is one reason why some cases of scabies do not clear up as they should. It is simply a matter of reinfection.

Urticaria occurs commonly throughout the year but it is of course most prevalent during the summer months, if we classify the various

food rashes as urticaria Fruits in particular will produce lesions which belong to the urticaria classification. Take time to run your finger nail over the back of the patient and you will find that dermographias will appear within one minute, whereas in acute eczema it will not. Urticaria is due to some food toxin in an individual with a highly sensitive skin. The following treatment seems to be very successful in most of these cases. Begin with a dose of citrate of magnesia, from eight to ten

Alopecia arcata in a girl of 13 The condition was completely cured by the use of the Kromayer quartz lamp

ounces, and follow for a few days with large amounts of water and about a dram of citrocarbonate in a glass of water four times daily The diet should be rather light Two baths daily, using a cup of baking soda to the bath, will greatly relieve the itching

Herpes Zoster or shingles, I am sure needs no particular comment except, that herpes zosters is occasionally the diagnosis in diseases showing bilateral distribution. As to the treatment of herpes zoster, the writer believes firmly in the intravenous treatment with sodium iodide especially in cases in which the pain is severe. In the early stage of herpes zoster we find that the condition responds very satisfactorily to heavy exposures with the quartz lamp

Syphilis of course, has to be kept in mind in practically all of these conditions because it is very apt to be confused with other diseases. Its diagnosis depends on so many different forms that it would be impossible to cover the subject in this paper. There is one thing, however, in the various rashes of syphilis both

secondary and tertiary which I think might be a practical point to mention, and that is the reddish ham color macular or papular spots in the eruption have a general appearance as that of a reflection. It seems under the skin If we look at these spots carefully we will notice fine lines running across the lesions parallel to each other, as well as close to each other. The diagnosis of skin syphilis should not depend upon the Wassermann because it is less accurate than it is in any other manifestation of the disease. The therapeutic test is also as important here as the Wassermann

Little mention has been made of such diseases as acne, rosacea, pityriasis, dermatitis herpetaformis, lupus vulgaris and others, simply because it would require too lengthy a paper to discuss them However, acne is a very common disease and of course its diagnosis needs no mention. It might be well, however, to

emphasize the fact that acne is due to an infection in the skin as a result of a general lowered body resistance, as well as a lowered resistance of the skin itself. Its treatment should be directed therefore equally in both directions. Ray treatments help acne, but if the general resistance of the individual is not improved, the disease is most certain to return. On the other hand acne is amenable to treatment, and curable in most instances if both phases of the treatment can be adhered to

In closing may I again emphasize that we have only covered some of the more common dermatoses and perhaps a few points of interest regarding each. Dermatology is best explained by the details of each lesion and for this portion of the paper we will turn to a series of lantern slides, which will perhaps bring out the points of interest in a more vivid manner.

A CASE OF CEREBELLAR TUMOR, CEREBELLAR ABSCESS, AND AN OTITIS MEDIA

Three Cases of Brain Disease with Similar Symptoms but Diverse Pathology
By DAVID L POE, M D, NEW YORK

THIS paper is inspired by the fact that each one of the three recorded cases herein discussed occurred at three different institutions in three different cities during a short interval of time, each case presenting phases of similar type, the phases of similarity being the extreme difficulties the attending physicians experienced in localizing the foci. In each one there occurred clinical symptoms pointing to a lesion in a definite area, then these symptoms in turn becoming clouded by the appearance of other symptoms, which in the main, were essentially alike, yet showing evidences of deviation sufficient to induce the attending doctors to hunt for lesions in parts other than the organs first outlined

There are certain signs and symptoms which experience has taught the medical profession as belonging to disturbances of given organs, yet almost the very same clinical manifestations may occur when entirely different organs are affected In consequence of the similarity of symptoms produced, as a result of disease of different parts of the body, the entire clinical picture may be so clouded that the clinician may face the most arduous task, necessitating indefatigable labors and the closest vigilance in order to place the trouble where it belongs The last drop of experience and ingenuity is required to get at the bottom of the ailment. It goes without saying that the proper measures of relief can only be instituted after the malady is localized and diag-If to definite major symptoms, which in themselves produce extreme difficulties in diagnosis, other symptoms are superimposed, one clouding the other, the diagnostician finds himself in a very unenviable position. Add to these difficulties a lack of co-operation, coming either from the patient directly, or from the patient's kin the doctor faces a most perplexing situation each one of the three cases herein recorded presented just such problems makes the discussion extremely interesting. That they had occurred in three different cities is evidence, carrying particularly strong weight, that all engaged in the problem of alleviating the ills of man, are not infrequently called upon to unravel similar skeins three cases are not pathologically alike They present clinical perplexities of a like character, therefore I grouped them together Many of the hard cases, heart-breakers, so to say, leave us, for one reason or another, ere we have had a good chance to make a thorough study. In other instances, permission is refused to make a pathological examination after death, offering us no chance to verify or disprove our clinical interpretations

These three cases have been watched carefully in the respective hospitals, the progress of their condition carefully noted and pathological findings eventually made, supplying a complete study in each instance

The first case is that of W J S, male, white, American citizen, 47 years old Family history Father died at the age of 72, mother died at the age of 65 Patient had six brothers, all dead, six sisters, five of whom are dead and one living The cause of death of each of the foregoing is unknown

The patient is the father of ten children who

are all living His wife had only one miscarriage The patient informs us that he had a chancre in 1901 for which he received intravenous injections In 1915 the Wassermann reaction was two plus, for which he was immediately given antiluetic treatment Subsequent Wassermann reactions

were negative

In 1923 the patient had an attack of shortness of breath which came on suddenly as he was climbing some steps in his home. He had been suffering from severe coughing spells for sometime, but now they have become much aggravated Soon after this the patient visited one of the leading clinics in New York City where he was informed by the attending doctor that he probably was suffering from Asthma The patient was able to work until Dec, 1926, when he developed paralysis of the entire left side of the body was just following an irrigation of his antrum, which, however, had been irrigated several times before It is of extreme importance that we note and mark carefully that the hemiplegia followed an irrigation of his antrum. There are instances of this type recorded in medical literature. Some cases have been reported in full I call particular attention to this case because a hemiplegia following an irrigation of a nasal accessory sinus is not a usual thing but rather rare, but that it may occur is evident from a perusal of the rhinological literature It might be stated that I could not verify the occurrence of a hemiplegia in this patient from the records of the hospital where he informed us he was treated The paralysis gradually became better until there was almost a complete return of functions of the left side Since Dec, 1926, the man had several fainting spells, became very weak on slight exertion, and had palpitation of the heart. For the past three years he had to rise two or three times at might to urinate He had no burning or tenesmus

In June, 1927, the patient developed a severe pain in his head which has been present since. This pain is not localized and is intermittent, but is present most of the time. He states that he has not been free from this pain a whole day since it started He vomited frequently The vomitting was of a projectile type, with no apparent The vomittus contained many curd-like effort

In September, 1927, two days after admission to the hospital he was examined by the staff with the following findings recorded

X-ray of the head essentially negative No evi-

dence of a brain tumor

X-ray of the chest disclosed probable bronchiec-

Electrocardiagraph, myocardial damage with extrasystole (Myocarditis chronica)

Physical findings

Blood pressure, 110 systole x 75 diastole mg

Hg Lungs, full of sonorous rales No cavity dem-

Severe cough with expectoration of onstrable thick muco-purulent sputum Sputum has never been tinged with blood About ten examinations for tubercle baccilus were made but none were found, making the examinations for tubercle bacilli essentially negative. There was well marked low grade inflammatory changes in the right base and lower lobe The right dome of the diaphragm cannot be outlined. The findings resemble what is usually seen in bronchiectasis

Abdominal, obesity, otherwise negative tient's former weight was 164 pounds and at the present time the man weighs 220 pounds gain in weight occurred since being confined to

Neurological, slight hemiplegia of the left side, probably residual from old hemiplegia Evidence of muscular weakness The man had to be fed, seemingly unable to feed himself No spon-Adiodochokenesis, positaneous nystagmus Spinal puncture done. tive in upper extremities Fluid clear, under increased pressure Wassermann negative

Bloom serum Wassermann negative Larsen Ring Test is negative

U		

Funds oculs, Choked disc in both eyes, the papilla in the left eye more pronounced than in the right The choking was quite pronounced The field of vision could not be taken on account of lack of cooperation, the patient would not hold his head quietly Motility of the eye ball appeared normal There was no complaint of double vision There was no ocular inflammation observable Reaction to light and accommodation prompt and within normal limits The patient complains of dizziness, but there is no spontaneous nystagmus

The patient remained confined to his bed The temperature remained within normal limits occasionally going as high as 101 degrees F, once even going as high as 103 degrees F but that was

only of a passing nature

Under careful medical attention the patient seemed to show marked signs of improvement The headaches subsided, there was no vomiting But he continued to cough and expectorate large quantities of muco-purulent fluid Repeated microscopical examinations of the sputa repeatedly disclosed large numbers of spirillae. As a result it was thought advisable to give the patient salvarsan medication, after which he showed rapid signs of improvement. He could even sit up now

The question which baffled the clinicians was are we dealing with a tumor cerebri, a metastatic cerebral abscess secondary to the definite signs of bronchiectasis, a syphiloma, tuberculoma? Tuberculoma could be ruled out with a reasonable degree of safety because no clinical evidence of tuberculosis could be found Having definite signs of bronchiectasis with continuous discharge of large quantities of a muco-purulent substance it is quite possible that we were dealing with a At any rate it could not be metastatic abscess entirely ruled out There have been a number of such cases observed That too may give us a choke disc

What about syphilis of the brain? It is true that we have negative laboratory findings negative laboratory findings do not exclude cerebral syphilis and bilateral choked disc is sometimes an accompanying symptom of that condi-We must not forget that the patient had had a syphilitic infection, and that his Wassermann was positive at one time He also suffered a hemiplegic attack at one time. That may have been due to a luetic condition of the brain How can we account for the vomiting? There were opinions expressed that the vomiting may be due to local conditions of the stomach and intestines That, howsecondary to the lung involvement ever, cannot be thrown off quite so easily for the vomiting has been observed to be of a projectile character, and came at times without any effort. Such a type of vomittus does not frequently come from an involvement of the gastro-intestinal tract Yet, we were obliged to admit that almost immediately the patient showed an improvement in his general condition after salvarsan medication

The individual was taken out of bed and placed in a wheel chair. Very soon all the former symptoms returned,—headache, vomiting, incoordination and loss of balance. He was placed back into bed at once. The symptoms soon abated in their severity.

A fundi oculi examination was again undertaken. This time the choking was markedly decreased. Perhaps a beginning atrophy? Field could not be taken.

The speech remained normal at all time Cerebration was somewhat slow

The headaches became very severe Ataxia Cerebelleus was distinct Ataxia of both upper and lower extremities Intentional tremor present Adiadochokenesis positive The leanings towards the acceptance of a cerebellar lesion became pronounced The question arose, with what type of cerebellar lesion are we dealing? What part is the purulent bronchiectasis and what part is syphilis playing in the cerebellar or cerebral

involvement? Or are we having to do with an entire independent lesion of the brain? Independent of his former luctic infection, independent of the purulent lung condition. The cough, which persisted during this entire period, was now less productive.

The patient suddenly passed out about six months after admission to the hospital

The post mortem findings were as follows

Brain, in the cerebellum was a tumor about the size of an English walnut, cystic in the center, but with a definite neoplastic wall. Its position was such as to destroy practically the entire worm

Heart, the heart showed advanced fatty infiltration. The muscle was degenerated. The right side was acutely dilated. There was no valvular disease. The coronaries were patent.

Aorta, showed advanced atheroma

Lungs, disclosed moderate emphysema and passive congestion

Liver, the liver showed only passive congestion, the gall bladder contained a stone about the size of a large marble. The mucosa was atrophied and the wall thickened by fibrous tissue.

Gastro-intestinal tract, negative

Pancreas, negative

Spleen, negative Outside of passive congestion

Adrenals, negative

Kidneys, showed a moderate chronic nephritis with some congestion

Urmary bladder and prostate, negative Microscopical pathological findings

Brain tumor the section presents glia-cells and The typical astrocyte is predominant glia fibres There are also large glia cells with cytoplasmic processes, large nuclei, with multiple nucleoli and these closely resemble ganglion cells Occasionally there are cells containing multiple nuclei. The significance of these ganglionic glia cells has generally been interpreted as an expression of the normal developmental tendency of the originating cells of the tumor, both glia and ganglionic cells being derived from neuro-epithelium normal brain tissue Golgi and V Koelliker find glia cells approaching the form of ganglion cells and Renaut's view that glia-cells functionate as conducting nerve-cells is being regarded with increasing favor Throughout the section the blood vessels are very abundant Some appear as medium sized arteries with well developed walls, some are capacious venules with thin walls, and a few are large sinuses The walls of the vessels have undergone hyalinosis, terminating in lamellated homogeneous masses The capacity of the blood vessels has been very great, and the blood content must have been subject to wide As a matter of fact, the course of glioma is usually marked by intermittent symptoms dependent on variations in the blood content, and hemorrhage with apoplectic symptoms is frequent. Hemorrhages in this case are not

It is quite possible, however, that a apparent sudden variation in the blood content of the vessels with consequent pressure upon the vital centers may have been the immediate cause of death We have searched through the brain to account for the left sided hemiplegia noted in the history of this case without avail. The cerebral hemisphere did not disclose any lesion which might have affected the pyramidal tracts. Nor did sections thru the crus cerebri, pons, medulla oblagota, or basal ganglia disclose such lesion

Heart, I failed to emphasize that a clinical diagnosis of Miocarditis Chronica was made in addition to findings The microscopical examination discloses a beautiful picture of cardiac degeneration of the Right Ventricle, the muscle shows pronounced degeneration proceeding from granular fatty to hyaline changes Right Auricle,

same as R Ventricle

Left Ventricle, there is a rather pronounced hypertrophy of the muscle There is a definite granular degeneration, altho for the most part striations are visualized. The degeneration is nowhere as near as that of the right ventricle

Left Auricle, there is considerable cloudy

swelling of the muscle

Aorta, there is a definite atheroma, but no definite luetic changes are apparent

Right lung, base—there is a moderate passive Many alveoli are filled with a purulent exudate The tributary bronchioles are similarly affected There is also moderate emphysema

Middle lobe-shows moderate passive conges-

tion and emphysema

Apex-same as middle lobe

Left lung, Base—moderate passive congestion and emphysema

Apex—same as left base

Kidneys there is a moderate increase in the interstitial connective tissue with a retroactive glomerulo fibrosis There are several foci of round cells distributed irregularly throughout the Many of the convoluted tubules have their epithelium swollen and present granular degeneration Many of the tubules are occupied by desquamated epithelium and granular debris There is a pronounced passive congestion

Pancreas, Adrenals Stomach, Urinary bladder

were negative

Liver, shows passive congestion considerable fatty metamorphosis consequent thereon

Spleen, shows moderate passive congestion

Lieut Comdr F S Johnson (MC) who made the pathological examination of this case made the following pathological diagnosis

Tumor occupying the worm of the cerebellum, chronic myocarditis with acute dilatation of the right heart, terminal broncho-pneumonia, chronic nephritis and passive congestion of the viscera

In this particular case we are faced with the

consideration of an early syphilitic infection which may have had all kinds of consequences in its wake In the early history of the patient's ailment from which he did not recover he showed all evidences of an asthma which pointed to a possible lung involvement which afterwards manifested itself as a purulent bronchiectasis He also suffered from a myocarditis chronica which was clinically recognized and diagnosed These produce fairly well established symptomatology Their complications can be reasonably well mapped out as they are pretty well known internists, especially the chest specialists, can be reliably depended upon to block out the disease, as has been shown in the observation of this But superimposed upon the affliction, (Myocarditis Chronica), as originally diagnosed, is another of a most serious type of an independent character, is not of common occurrence. Its diagnosis taxes every grain of medical expenence and ingenuity as shown in the course of this man's affection It also proves most conclusively that a patient may be suffering from multiple fou, one being practically independent of the other, any one of which may be of sufficient destructive-The multiplicity of foci ness to produce death are the considerations which must be continually kept before one when called to the bedside of the

The second very instructive case concerned a male, about 38 years old Married and had five children Wife had no miscarriage Color, white American citizen

The patient became suddenly ill, with severe vomiting, headache and dizziness. A doctor was called, who diagnosed the condition as a possible gastro-intestinal disturbance After several days the symptoms became much more pronounced It was observed now that the patient's sclera and skin was becoming gradually discolored The mucous membranes also showed signs of discoloration. He was very sensitive to pressure around the liver, The tongue especially the gall bladder region There was epigastric fullness was coated conjuctiva assumed a slight yellowish discolora-The pain at times was agonizing and There was more or less collapse paroxysmal The temperature was of a septic type. There was The most distressing loss of appetite, flatulence symptoms were the dizziness and vomiting There was no spontaneous nystagmus observable. After careful attention from the internist, after proper medical treatment, the patient's condition became markedly improved The vomiting subsided, the dizziness became considerably less pronounced and the pain and tenderness in the epigastric region The conjunctiva, the skin and mudisappeared cous membranes commenced clearing in color, in fact they were practically normal now shortly, i e about a week after the patient commenced feeling quite comfortably, again an aggravation of all the previous symptoms,-dizziness, vomiting, pain over the liver radiating to the right shoulder, and there was also more or less collapse Again the attending physician was called to the house, and again the same medication applied, and once more almost an immediate Only several days, after improvement occured the general condition, showed marked improvement, the patient began complaining of severe ear ache and headache An otologist was called The drum membrane appeared to be abnormal in color, it was therefore incised A muco-purulent discharge exuded It was cultured Staphy-The headlococcus seemed to be quite abundant The earache was aches increased in severity also very bad There was no spontaneous nyst-The man was admitted to the hospital No history of a previous ear affection could be obtained either from the person himself, or from any member of his family. The immediate family attributed the severe headaches to a psychic trauma as a result of domestic difficulties he had been experiencing the past six months of the total absence of all history of a previous ear affection, the attending otologists were very much inclined to the belief that an ear affection existed just the same Serum Wassermann was negative There was no history of a luetic infection, and no history of tuberculosis puncture produced a clear fluid, under no increase of pressure, but it contained about 300 cells differential count was not made A mastoidectomy was done The bone was found to be very hard, eburnated There were evidences of some pathology having existed The surgeon recognized that it was a serious condition with possible intracranial complication But before assuming the responsibility of exploring further, he considered it advisable to have the consent of the immediate He therefore placed the entire matter Notwithstanding the earnestness before them with which the patient's condition was presented they did not feel that the complication was due to pathology of the ear They felt that his suffering was mainly attributable to his domestic troubles They absolutely denied a previous ear affection Yet the various tests pointed quite distinctly to a possible labyrinthine affection. The writer was called into consultation At this time it was not difficult to diagnose the case as a possible menigo-The patient's breathing was sterencephalitits torous, labored, the pupils were unequal, pateller jerk exaggerated, Babinski positive, the fundus oculi disclosed a partial choking of the discs account of the patient being in a semi-conscious state further neurological tests were difficult to carry out with satisfaction The following day the patient passed out The family gave permission for a partial post mortem examination. The gastro-intestinal tract was very imperfectly ex-The brain, on the contrary, was very carefully gone over Immediately after the calvarium was removed, meningitis, even tho imperfectly, was in evidence. At the base it was very marked As the brain was removed it was observed that there was a large cerebellar abscess, with destruction of almost the greatest part of the There was considerable purulent matter within the skull on the side of the abscess When some of the pus was wiped out it could be seen that there was a communication between the labyrinth of the internal ear and the cavity Purulent matter was seen to of the cranium come from this communication into the cranial cavity On close examination it was found that the communicating orifice was at the place where the subarquate fossa is usually found to exist. At first it was thought that since this fossa is quite pronounced, and that in the infant it frequently acts as a communication between the cranial cavity and the internal ear, and that because of developmental deficiency it remains open in the adult, we were dealing with a natural opening thru which the mection passed from the internal But on further scrutiny ear into the cranium it was discovered that while there was a tendency for an opening in the region of the subarquate fossa, there was in reality a destruction of bone which enlarged the natural opening thologically it was clearly shown that clinically we had to do with a labyrinthitis with subsequent cerebellar abscess, meningitis circumscripta, superimposed upon a possible cholecystitis and cholelithiasis The latter diseases made their appearance clinically first, while the former showed up shortly afterwards

This case presented features of unusual interest

First, there was an absolute denial of any ear affection previous to the patient's illness

Second, The appearance of a septic cholecystits, cholelithiasis, gastro-intestinal infection produced a train of symptoms which entirely clouded the symptoms of an early infection of the labyrinth

Third, how did a labyrinthitis occur? Was it a result of an exacerbation of an early otitis media or was it secondary to the septic gall bladder trouble? I am inclined to think that it was an exacerbation of a former otitis, and not secondary to the gall bladder affection. I am making a histological examination of the temporal bone (the petrous portion) and shall report as soon as it is finished. It will in all probability shed some light as to whether the labyrinthitis with the subsequent cerebellar abscess was due to an exacerbation of a former otitis, or was secondary to a septic cholecystits.

In this instance the large number of symptoms which first presented themselves were soon intermingled with symptoms as a result of a diseased condition of another major organ making a localization of the affected parts extremely difficult. The symptoms produced by disease of both major organs have many common features,

and when they occur simultaneously it is frequently extremely difficult to separate one from the other, and to know which are produced by disease of one organ and which are produced by the other. A postmortem examination is the only means by which a true diagnosis can be established.

The third case concerns a child V L B, age 11 years Color, white

The history states that the boy had had a running ear for about two years for which he was being treated. The ear was associated with more

or less pain for a long time

12/3/27 he was admitted to the hospital, where the following history was given. Three weeks ago the child began to have abdominal pains and vomitted frequently. His mother gave him cathartics for constipation. Two weeks ago the child began to run fever from 103 to 104 degrees F. He had a running ear at this time. The mother called the family doctor who advised that the boy be taken to the hospital at once, which was done and the boy admitted

Physical examination at the hospital

Ear, chronic mastoiditis, discharging ear left side

Nose and Throat, crusts and muco-pus in the right nares

Abdominal, tenderness when spleen is palpated, also when epigastrium is palpated. Abdominal pains severe

Lungs and other organs appear to be normal The boy suffered from constipation for which he had to be given enimata. He also vomitted occasionally Some complaint of pain in the chest There have also been occasional chills His temperature continued steadily between 103 and 104 Because the ears had stopped discharging he was brought to the ear department, since he was still running a septic temperature. Both ear drums were lanced, but only blood tinged serum was obtained It was not cultured ears and mastoid appeared normal The child was being observed carefully until 12/31/27 Up to that time it was thought that the little patient showed evidences of a typhoid infection The results of the various laboratory tests left the diagnosis open There was nothing definite to establish the disease from which he was suffering But the crux of the was considered atypical whole matter was the boy was steadily running a septic temperature, the tenderness about the gastrium, spleen, etc., became considerably de-In fact, at times the tenderness could creased not be elicided thru pressure About the abdominal region the youngster seemed to be feeling quite The ears were now again slightly discharging The temperature was thought now to be perhaps due to the ear infection 12/31/27 a left The bone apradical mastoidectomy was done peared to be very much necrosed It cut almost like decalcified bone The extent of the necrosis

seemed to be enormous Some pus was encoun-After the radical mastoidectomy, the boy appeared to be doing nicely He commenced becoming more cheerful, a bit stronger, and the temperature slightly decreased Several days afterward again the temperature rose to its former height and remained there Physical examinations, and X-Ray of the lung did not disclose any pathology It was deemed advisable to do an exploration, reopening of the mastoid, as well as to hunt for a possible sinus thrombosis The jugularis interna was tied off, the walls of the sigmoid sinus appeared to be unhealthy looking with granulations extending about its walls The child passed out the same evening

A post-mortem examination disclosed that the lungs and heart to be without any notable changes Findings of other organs as follows

The liver and gall bladder show no noteworthy

naked eye changes

Kidneys the left kidney is very flabby, blush red in color, cutting without difficulty. The substance of the kidney bulges noticeably beyond the cut edges of the capsule. Cortex and medulla are sharply differentiated. The cortex is dirty pink in color and the markings are extremely irregular, in places completely obliterated by opaque, cream colored, swollen parenchyma. Near the upper pole, just beneath the capsule, is a somewhat triangular shaped, cream colored, slightly softened area which extends downward into the substance of the organ for a distance of about 1 cm.

The right kidney is essentially the same as the left and likewise presents a small cortical col-

lection of pus, yellowish in color

Stomach, The greater curvature of the stomach at about its center presents, immediately under the mucosa, a large, irregularly rounded, opaque, dirty cream colored, softened area which, on section, is found to be infiltrated with pus, the pus lying between the mucosa of the stomach and a large batch of externally attached omentum. The rest of the mucous membrane of the stomach shows no noteworthy naked eye changes.

Spleen, It is extremely flabby and, seen thru the capsule, is bluish red in color. At about the junction of the upper two-thirds with the lower third, at the anterior edge of the spleen, the omentum is firmly attached and, on breaking up this attachment, the splenic tissue immediately beneath is the seat of an abscess, filled with greenish This abscess is irregularly rounded, measuring about three cm in diameter and two cm in depth In the outer portion of the spleen, a few cm above the lower pole, lying immediately beneath the capsule, is another, slightly smaller abscess which, on section, extends downwards into the substance of the organ for a distance of about 11/2 cm and is likewise filled by faintly greenish yellow pus The splenic substance is abundant, soft, markedly congested and scattered through it

are innumerable pinhead sized or larger, rather dirty grayish follicles

Aorta, Suprarenals, and structure of the scrotum and pelvis are negative

Brain, On removing the calvarium, the pia and arachnoid covering the vertex is slightly edematous, but on section, the brain shows no noteworthy naked eye changes. The inner surface of the dura, corresponding to the area of the mastoid where the bone had been removed, is a quantity of reddish granular material, probably representing granulation tissue. The lateral sinus, on being slit open, was found to be lined by a smooth, glistening membrane, free from all signs of thrombosis. The pathological examination of this last case was made by Drs. Gonzales and Symmera.

The pathological diagnosis was multiple abcesses of the spleen, purulent infiltration of the greater curvature of the stomach, small abscess in each kidney, radical mastoidectomy

The three cases are here recorded with reasonable completness for purposes of study. The clinical picture is presented practically in their entirety followed up with the pathological findings.

In each case vomiting and dizziness seem to be a dominant symptom. The last case showed the least evidences of the last named symptoms, while the two adults were quite distressed with them, one during the early period of his illness while the other the latter period of the disease. Headache was present in all three cases. Again it must be

remarked that the boy suffered the least from it while the two adult patients were made miserable While the boy did not suffer from headaches as much as the two adults, it did however, present a prominent clinical manifestation, to which attention of the attending physicians were frequently directed Pain in the abdominal region existed in all three cases, in the first case it was not a prominent condition. Definite choked disc occured in the first case described in this paper, haziness of the discs in the second, while in the third the papilla seemed to be normal the third case there was a manifested ear disturbance, while in the second case, there probably was a latent of this with an exacerbation, and in the third there was none discoverable although clinical tests showed evidence of an internal ear dysfunction. In all three cases the clinical pictures were not clearly defined were clouded by overlapping and intermingling of symptoms, some of which were the result of derangement of one group of organs and others were present because another group of organs were dis-The intermingling and admixture of symptoms in all three instances were as a result of abdominal, chest and cerebral manifestations The pathological findings clear up the entire clinical course

In closing, I desire to add my thanks to the following for their cooperation in obtaining the data for this paper. Lt Comdr. J. F. Neuberger (MCUSN), Lt Comdr. F. S. Johnson (MCUSN), Lt F. M. Harrison (MCUSN), Drs. Solon Rhode, and Wesley Bowers

A PUBLIC SPEAKING COURSE BY THE QUEENS COUNTY MEDICAL SOCIETY By LEOPOLD M ROHR, M D, JAMAICA, N Y

THE following paper describes a concrete demonstration conducted by the Queens County Medical Society under the auspices of its Committee on Economics, of which Dr The object of the demon-Rohr is the Chairman stration was to develop the ability of the physicians to speak in public-clearly, concisely and The preliminary reports of the course were published in this Journal of March 15, 1928, page 346, and April 15, page 463 in public speaking are being conducted in Y M C A s, and physicians who have taken them have been enthusiastic in their praise Queens County Medical Society seems to have been the first one to adopt a public speaking course as one of its projects. It has set an example which other county societies may follow with advantage -Editor's note

Last autumn, Dr John H Wyckoff, Secretary of the faculty of the New York University and Bellevue Hospital Medical College, delivered at a regular meeting of the Queens County Medical Society, Queens County, Long Island, a most

Instructive and illuminating paper on the heart At the close of Dr Wyckoff's paper, the President of the Society, Dr Francis G Riley, threw the meeting open for discussion. What happened? Perhaps it may best be described by a line from Edgar Allen Poe.

"The silence was unbroken

And the stillness gave no token"

There were physicians in that audience who could have given, and who should have given, their own experiences along the lines discussed in Dr Wyckoff's paper. Why didn't they? The answer can be set down in a monosyllable—FEAR. They were self-conscious, they dreaded to stand up and face an audience they feared that they would not be able to think coherently. They owed it as a duty to their profession and their society to stand up and give the rest of us the benefit of their experiences.

If this situation were exceptional, the recording of it here would not be worth while. But it is not exceptional. It is rather typical of what

were marticulate

happened at the various scientific sessions as well as business meetings of the Queens County Society, and that organization is not unique in this matter

But bad as this situation was, it was mild in comparison to another one that confronted the medical profession of Queens County health organizations, mothers' clubs, schools, parent-teachers' associations, civic bodies, fraternal organizations and radio stations were continually sending in requests to the county society for speakers Certain organizations, such as the Queensboro Tuberculosis and Health Association, even offered to pay speakers for their ser-Here was an opportunity, or rather opportunities, for these things were happening all the time Here was an excellent way for the county society to create prestige for itself and its members and to render an emphatic public service by spreading the gospel of preventative medicine

Did we make the most of it? We did not In fact, we fell down woefully We found it practically impossible to find physicians who would agree to speak, and the few who would accept these assignments were well nigh worthless when it came to addressing lay audiences. They were too technical, too labored, too involved, too inclined to talk about things that interested them, rather than speaking in terms of the experiences and selfish desires of their hearers. In other words, they committed the greatest of all speaking sins—they were neither clear nor interesting

Such was the situation that confronted us, the county society There seemed to be but one intelligent way to meet it, and that was to launch a course in public speaking for physicians. The suggestion met with the enthusiastic approval of all of the officers of the society and plans were immediately made to turn the hope into a reality

The first problem was to secure the right kind of an instructor. We felt that he should be a layman. He would then be in a better position to help us prepare and deliver the kind of material that interests a lay audience. As a layman, he would aid us in clearing away all technicalities and making our points clear to the man in the street.

We also felt that we should avoid, at all costs, the "Professor of oratory"-the long-haired pedagogue who would open each session with voice exercises and lectures on "Medium stress" and We wanted something in-"Orotund" qualities tensely and immediately practical, and so we felt that we should have a man who had been successful in training business and professional men to speak in public, rather than someone who had devoted his life to teaching in the academic We secured the seratmosphere of a college vices of Dale Carnegie, who conducts courses in effective speaking each year in a number of clubs and chambers of commerce and cavic organiza, tions in New York and Philadelphia

We sent the following letter to all members of our society This letter was written on electrically driven Hooven typewriters and was ad-

dressed to each physician personally

"The Queens County Medical Society has reached the decision that it is imperative to develop public speakers to spread the message of our Society and public health and we feel they should be trained speakers. So we are forming a class which will meet every Wednesday evening from 8 45 to 10 45 for training and practice in Effective Speaking under Dale Carnegie.

"Wouldn't you like to become a member of

this group?

"The purpose of this course is not to make 'orators,' but to train physicians to 'think on their feet,' to develop their poise, to increase their self-confidence and to give them the ability to talk more interestingly and with more conviction to one person or an audience

"Many requests are coming for speakers who can do this, requests from health associations, mothers' clubs, schools, parent-teachers' associations, civic bodies, medical bodies and broadcasting stations. It is highly advisable, if not imperative, to develop physicians to meet this demand

"In addition, a long experience has shown that this training develops ones personality and increases ones effectiveness in talking to patients daily. It is unquestionably a distinct asset for every professional man. The medical societies in Kansas City and Chicago have already conducted similar courses with very gratifying results.

"There is enclosed a page giving the experience of a few of the men who took this training under Dale Carnegie last season, and also a booklet which you will want to read

"Here is a reply post card Will you be good enough to pencil your reply across it right now

and drop it in the mail at once?

"The membership will be strictly limited to 40, and a special rate of \$25 00 each will be made to the first thirty-five men who send in their enrollments. For further details, see the other side of this page."

The tuition fee for the course was \$50 But the Queensboro Tuberculosis and Health Association—a lay health organization—was so eager to obtain the services of trained speakers that it offered to pay one-half of the fee for the first thirty-five physicians who enrolled

This letter produced thirty-eight enrollments from the membership of our own society. A number of physicians living in New York City and Brooklyn asked to be admitted to the class,

but we were compelled to refuse them

The course consisted of fourteen weekly sessions. A number of our members had to travel from twelve to twenty miles to our meeting place, and so the classes were held from 9 to 11 o'clock Wednesday evenings. At the initial session of the course, each man was requested to stand up

and speak for two minutes on why he had joined the course and why he thought such training would be of value to the physician Sometimes Mr Carnegie suggested subjects for discussion, sometimes a committee that he appointed announced the topics a fortnight in advance, usually, however, each member was allowed to choose his or her own subject—I say her for there were three women in the class

The speeches were limited to three minutes—strictly A stop watch was held, and the time-keeper called out "time" at the end of the allotted quota. At the close of each talk, the instructor pointed out and praised its good features and showed how its weak ones might have been strengthened or eliminated entirely. At his own request, a stop watch was held on the instructor also, and he tried to limit his criticisms to one or two minutes. This enabled the sessions to move with commendable celerity and despatch

Our first aim was to eliminate the fear of public speaking that beset all of us. The members of the class acquired self-possession and poise and the ability to think clearly on their feet—they acquired these things with a swiftness that was truly surprising

As the course progressed, the members were shown how to make their talks interesting, how to be clear, how to state their facts impressively, how to begin and how to close No one was permitted to use notes or to parrot memorized words

The text used was the book, "Public Speaking for Business Men," by Dale Carnegie This is the official text book on this subject for all the YMCA. schools in America, and also for the educational department of the American Bankers Association.

What were the results of this training? In the first place, we are now able to take care of every request that we receive for speakers. The requests are numerous, and, since we can supply interesting and helpful speakers, the number of requests is constantly increasing. In the past, the charlatan and the quack advertiser have been sleeplessly active in spreading their pernicious propaganda before the public. We have sat silently by and as Mark Twain remarked about the weather "Every body has talked about it, and no one has done anything" Now, for the first time, we are equipped to do something—to send out ethical physicians, trained speakers, under the auspices of their own county society to educate the public concerning the laws of health, the necessity for early diagnosis and periodical health examinations, etc. We find that the public is willing and eager to get this information Isn't it our duty as well as our opportunity, to supply this legitimate demand?

In the second place, our meetings, both business and scientific, have taken on added color and interest More of our physicians are willing to prepare and present papers-and many are now willing to join in the discussions. We cite only one concrete case Our society is planning to erect a building for its own home at a cost of two hundred thousand dollars Had this question come up for discussion a year ago, only a few men who were able to think on their feet would have had the courage to stand up and say anything But now, thanks to this training there were a considerable number of men who willingly joined in the discussion. In almost any organization, medical or otherwise, are not the men who can stand up and speak the ones who run things? Haven't we been training our men for Leadership?

We have already had a number of requests for another class, and expect to organize and conduct it next season

CLINIC LECTURE ON THE TREATMENT OF HYPERTENSION

By MEYER A. RABINOWITZ, MD, BROOKLYN, NY

THOROUGH study of the history and Aphysical findings should be made for the factors in the production of the hypertension with reference to that particular individ-Syphilis, chronic infections and toxemias, climacteric disturbances, hyperthyroidism, hyperadrenalinism, hereditary predisposition, sclerosis of renal vessels, sclerotic or syphilitic disease of the aorta, sclerosis of the renal blood vessels, disease of the kidneys whether of medical or surgical nature, diabetes, gout, or increased intracerebral pressure must be looked for and treated accordingly At the present time there is a great tendency to overtreatment rather than undertreatment of hypertension

Judicious neglect with careful regulation of the habits may be of the greatest advantage

The treatment of hypertension must be individualized to obtain the best results. A complete change in the life habits of the individual will effect far greater results than the use of drugs. The amount of rest, occupation and exercise must be carefully determined in each individual case. If there is no especially marked exertion at the occupation of the individual, it is best to decrease the amount of work as little as possible in conformity to the needs of the case, or one will produce new symptoms or hypochondriasis. Absolute rest in bed should only be ordered in the event of

closely repeated severe attacks of angina pectoris, cardiac decompensation, or during periods of marked decrease of food intake on a couch will often prove of great value without the necessity of putting the patient to absolute rest in bed Naps or periods of rest on the couch during the day, occasional rest days on the couch or in bed, holidays spent with complete physical and mental relaxation, and frequent short vacations should be indulged in Rest, as already stated, must be not only physical but mental The avoidance of all factors tending to create irritability should be particularly guarded against in nervous, excitable and restless people should be carefully taken care of and will be discussed at length under the symptom insomnia

Smoking should be markedly reduced, and stopped completely if there are evidences of coronary sclerosis, angina pectoris or intermittent claudication. The use of heavy cigars or cigarettes is to be forbidden, as these cause an increased tendency to vasospasm. Residence should never be at a greater than moderate altitude.

Psychotherapy—The patient must be assured that increased blood pressure does not mean incurable hardening of the arteries. He is not to be told his blood pressure figures and one should not stop all work or exertion. Careful balneotherapy and the D'arsonyal current act in the main as suggestive therapy.

Hydrotheraphy and Balneotherapy—Hot foot baths with or without mustard are of value for dizziness Half or three-quarter-full baths, warm, lukewarm or at indifferent temperatures may be used Cool rubs may be used when the blood pressure is only moderately in-Cold douches, vapor baths, or hot baths are absolutely forbidden because of the danger of sudden increase of blood pressure and resulting cardiac insufficiency or apoplevy Carbondioxide (Nauheim) baths are to be used with extreme caution and are contraindicated in the presence of very high blood pressure, impaired vaso-motor regulation, tendency to angeiospasm, secondary contracted kidney, renal arteriolar sclerosis or primary contracted kidney, tendency to tachycardia, or aortic A temporary stay at a spa where radio-active springs are present may be of some

Diathermy to the precordial area may be of some value where there is a tendency to angina pectoris. The use of a sunporch and sunbaths for periods of several months are of decided value for the dilatation of the blood vessels. Careful protection of the head against sunstroke is necessary.

Diet —The diet must be regulated according to whether there is associated arthritis, asthma, glycosuria, liver insufficiency, cardiac insufficiency, obesity, flatulency, or nitrogen reten-

tion A decrease of calories is always indicated in the presence of obesity. A slight decrease of food intake for short periods, except in the very badly nourished, may prove of decided One must avoid starvation presence of obesity, marked reduction of the carbohydrates is essential and one should watch the weight and blood sugar Hunger days in the nature of compotte days or milkfruit days may be of decided value. The use of a compotte day every ten to fourteen days in which nothing but three pounds of well cooked apples, sweetened with lactose, as much as the patient can tolerate, together with the use of a half to one liter of water a day, all given in six divided portions with the patient resting on a couch has been advised by Jagic and Falta Morawitz believes that milk and fruit days may be of even greater value. The amount of fluids allowed should be varied according to the thirst of the individual, never being over one to one and a half liters a day It is important to remember that if the patient drinks less he will also eat less

Salt should be decreased in amount, being markedly decreased where there is marked One should avoid the long use of salt free diet for fear of producing marked anorexia In certain instances the salt deficiency may be covered by the use of sodium bromide to replace the salt at the table Alcohol should only be used in very small amount in those accustomed to it Wines and beer should be forbidden because of the large fluid content Coffee and tea may be allowed, except in the very nervous and excitable There is no point in the restriction of coffee or tea where the use of theobromine is indicated Proteins such as meats, eggs and milk are to be given in Occasionally meat free days moderation should intervene The proteins are only to be markedly decreased where there is marked nitrogen retention, and even then at least 25 to 40 gramms of protein should be allowed daily Spices are to be decreased Cathartic waters are of decided value to deplete the organism in the plethoric and robust

Drugs—It will be found best to give small doses of drugs, such as sedatives and vasodilators wherever necessary in combination. The chronic intermittent use of sedative drugs will be found distinctly advantageous. It is best to start with small doses for fear of rapidly losing the effect. Sodium bromide 30 to 45 grains a day will be of value in the hypertension of the climacteric, neuropathic and the essential types. Adalin—4 grains two to four times a day for periods of three weeks is particularly of value in the insomnia and hypertension of central causation. Luminal—1/2 grain three times a day may be advantageously combined with theobromine and papaverine in in-

somnia, angina pectoris and intermittent claudi-Medinal—1/2 grain three times a day may be used with theobromine. Veronal may not be well borne in the presence of cardiac decompensation Codein-34 to 1 grain may be used with bromides Papaverine in large enough doses to show slight sedative effectsuch as 3/5 to 3/4 of a grain, two or three times a day, will prove of decided value in the presence of essential hypertension, coronary disease or angeiospasm. It is absolutely of no value in the presence of fixed hypertension dependent upon vascular changes hydrate is of decided value and is a drug insufficiently used The dosage should be 15 to 20 grains daily and one must watch for chlor-It is not to be used in the presence of a fatty heart, myofibrosis or coronary sclerosis It is of decided value in insomnia, vascular crises, contracted kidney, cardiac asthma, beginning pulmonary edema and cardiac decompensation Calcium chloride intravenously, or in the 15 grains together with small doses of atropin-1/200th of a grain four times a day, with or without theobromine is recommended in the hypertension of the climacteric, irritable vegetative nervous system and essential hypertension

Vaso-dilators - These are particularly to be recommended in the presence of a tendency to angeiospasm and in essential hypertension They are not to be used with the single purpose of knocking down the blood pressure Among the vasodilators we may consider the nitrites, chloral hydrate, the purins, benzyl-The nitrites are benzoate, and papaverine especially recommended in the presence of coronary spasm or migraine of hypertensive The chronic use of nitrites is not to be recommended, in order to avoid the patient becoming accustomed to it without obtaining any therepeutic effect Amyl nitrite by inhalation in small dosage has a marked effect on the brain and blood vessels of the upper part of the body In large doses it effects the blood vessels over a greater area Nitroglycerin 1/60 to 1/40 grain, in the form of spiritus glonoini may be given by mouth. It effects a decrease of blood pressure of about 25 mms of mercury in five to seven minutes, which lasts from one to three hours Sodium nitrite may be given by hypodermic injection subcutaneously in the form of $\frac{1}{2}$ to 1 cc of a 2% solution daily or every second or third day It usually causes a decrease of the blood pressure of about 20 mm of mercury, which effect lasts several hours It may also be given to advantage by mouth in doses of ½ to ¾ grain combined with 10-15 grs of sodium nitrate-15 gr of sodium bicarbonate in a half a glass of water every morning on arising for a period of about eight days, stopping for a

period of about eight days and alternating with a preparation of theobromine Chloral hydrate in small doses of 4½ gr three times a day has a distinct action on the vasomotor centre of the medulla and the blood vessels of the brain, skin and kidneys

The purins have a beneficial effect on the peripheral, cerebral, coronary and renal blood vessels and are therefore of decided value in the presence of arteriosclerosis, angeiospasm and angina pectoris Pure theobromine may be given in doses of 41/2 to 71/2 grains two or three times daily and will produce less gastric irritation and surer diuretic action than theobromine sodium salicylate Theobromine sodium salicylate or diuretin should be given in doses of 25 to 30 grains daily Where no effects are obtained, 75 or more grains a day should be tried. It is to be given for periods of eight days followed by rest periods Its diuretic effect is absent or slight in the presence of normal acidity or hyperacidity of the stomach, and is apt to produce marked gastric It is of decided benefit in angina Euphyllin is a very marked renal, pectoris cerebral and coronary dilator and may be used in dosage of 4 grains in suppositories several times daily or in 10 c c of distilled water injected very slowly intravenously

Benzyl-benzoate in the writer's experience has proven of no value. Papaverine is of no value where there is an anatomical basis for the increase of blood pressure. It is of decided value where there are fleeting rises of blood pressure associated with vascular crises, acute glomerular nephritis, lead poisoning, the climacteric, neurotic individuals and in essential hypertension. Its hypodermic use is to be restricted because of pain produced at the site of injection. It may be given in doses of 3/4 to 1 grain subcutaneously, or 2/3 of a grain three times a day by mouth

Glucose intravenously 10 to 20 c c of a 20 to 50% solution is of symptomatic value, particularly in essential hypertension tion is of decided value in vascular crises where there is a danger of apoplexy—that is, when the patient has a sensation of a bursting feeling of the head or sees red It is of value in climacteric ammenorrhea associated with hypertension, in plethoric individuals suffering from headache, stupor or dizziness. It is not to be used in the presence of persistent hypertension of vascular damage unless associated with acute pulmonary edema or ingravescent apoplexy The amount removed should not be over 500 c c Liver extract has been advised but has not proven of any great value The iodides are of problematic value if there is no lues present. There is a danger of iodides producing hyperthyroidism in many people particularly those suffering from ade-

nomatous goiters If used at all it should be given in very small doses Ergot or ergotamine tartrate has been found to decrease the blood pressure for short periods Atropin sulphate in very small doses several times a day together with calcium chloride has been advised in essential hypertension Ammoniosulphocyanate, 1 to 5 grains three times a day has been advised. The endocrine glands may be used in the presence of definite endocrinic Ovarian gland is of value in disturbances the climacteric hypertension Small doses of thyroid daily in the obese has been advised There is danger of large doses of thyroid increasing the blood pressure or producing dia-The use of thymus and anterior pituitary gland are of problematical value therapy to the adrenals deserves theoretical consideration Garlic because of its allyl compounds may be mentioned Quinine in heightened sympathicotonus, particularly with tendency to angina pectoris may be tried carpine in small doses of 1/80 of a grain two to three times a day for months, with small doses of thyroid and papaverine may decrease the systolic and diastolic blood pressures and have no effect on the basal metabolism or weight If no effect on the blood pressure results the basal metabolism may be increased and the weight reduced

Where hypertension is the result of an aortic reflex—whether because of atherosclerosis or syphilis of the aorta—paravertebral injections and resection of the sympathetic branches and sympathetic rami are of theoretical consideration. Should the patient at any time be in need of surgical intervention for one disease or another, operation is not contraindicated. The use of digitalis before and after operation may prove of decided value. Spinal anesthesia is well borne and its danger of lowered blood pressure is of less importance as compared with the risks in individuals with normal blood pressure.

Constipation is to be met by the use of saline cathartics. These also lower the blood pressure by dilating the splanchnic vessels. The use of small doses of magnesium sulphate or sodium phosphate every morning on arising will here prove of decided value.

Insomnia is to be combated by the use of adalin, luminal or bromides. The headache of hypertension may require the use of sedatives, acetyl-salicylic acid, an active saline purge, a hot mustard footbath, colonic irrigations of 2% sodium bicarbonate, markedly reduced fluid and food intake, and possibly venesection or lumbar puncture. Angina pectoris

is to be treated with the pure theobromine or theobromine sodium salicylates or euphyllin

Cardiac decompensation is an imminent danger at all times as a result of long persisting hypertension The prophylactic use of small doses of digitalis, such as 4/5 of a grain of the standardized powder three times a day for periods of eight to ten days, alternating with small doses of nitrites, may prove of decided value even if no manifest decompensation is present Decompensation should be treated at the earliest sign, as decreased amount of unne during the day, increased amount of urine at night, frequency of urmation at night. This will at once call for a reduction of fluids and salt or the possible use of the Karell diet of 800 to 1000 c c of milk distributed over the day in small portions for periods not longer than three days A large venesection of 400 to 500 c c is often indicated Powdered digitalis is to be given in doses of one and a half to three grains daily to full digitalization Where cardiac tonics are urgently indicated the use of strophanthin in small doses intravenously may be a life-saving procedure. After full digitalization, digitalis may be given intermittently over long periods in small doses as a prophylactic, 34 to 11/2 grains daily for three days each week will often prove satisfactory The danger of digitalis causing an increase in the blood pressure is a purely theoretical one In fact, digitalis may cause a lowering in the blood pressure—that is a restoration of the blood pressure to its optimum In the presence of liver stasis, digitalis by mouth may prove of no value and its use rectally or intravenously be of absolute necessity

Caffein is of value in the presence of cardiac decompensation attended by a slow heart The use of theobromine or theobromine sodium salicylate and chloral as diuretics, may prove of decided value Morphine is to be used with the greatest hesitancy except where cardiac decompensation has been restored. It is absolutely contraindicated in the presence of irregular, undulant, or Cheyne-Stokes respiration or in the presence of dyspnea due to left ventricle insufficiency Small doses of morphine when given with only moderate doses of digitalis in the presence of predominant left ventricle insufficiency have at times resulted in very marked and persistent vomit-In the presence of cardiac asthma with Cheyne-Stokes respiration, euphyllin intravenously, venesection, strophanthin intravenously, or chloral by mouth have proven of decided value Other complications such as cerebral hemorrhage need not be discussed at this time

DEPARTMENT OF OUR NEIGHBORS

A great increase in the number of items relating to the practice of public health by family doctors and county medical societies is noticeable in the medical journals of the several states A reading of these journals confirms the reiterated statements of the officers of the Medical Society

of the State of New York that public health must be one of the major activities of every County and State Medical Society Public health items taken from the journals of our sister states will be a prominent feature of the department of "Our Neighbors"

SURVEY OF THE FIELD OF PUBLIC HEALTH

Physicians are developing a consciousness of their relation to all phases of human health Everybody concedes the supremacy of the physician in sickness and disease, but his authority over the half sick and the well is not so widely recognized. The doctor is not sure of his welcome when he warns the well of approaching danger and seeks to turn them from unhygienic habits.

Doctors are probably doing more real public health work than they are aware of or are credited with Dr Haven Emerson devoted a large part of an address before the recent State Conference of Health Officers to showing how family doctors are already spending a large proportion of their time in practicing some form of preventive medicine, such as examining the slightly sick, giving preventive serums and vaccines, diagnosing those who fear they may have contagious diseases, and giving attention to sickness and disease in increasingly early stages until now they recognize sickness in its preclinical stages (Page 1010)

As doctors take up the recognition and treatment of extremely mild forms of ill health, they come into competition with nurses and physical trainers whom they have allowed to enter into the outskirts of the practice of medicine by the hygienic route Nurses and physical trainers, and even the officials of departments of health, claim the privilege of giving advice which is hygienic in distinction from that which is medical or surgical Their conception of hygiene is that it is a knowledge of physiology and medicine which is common to fairly educated persons Nurses and physical trainers claim the privilege of applying that kind of knowledge in their chosen fields of practice It can readily be seen how there will be a conflict between the hygienic practitioners on the one hand and licensed physicians on the other

The earlier a disease or departure from health is diagnosed, the more the field is occupied by non-medical health workers various forms and degrees of medical practice are arranged in a progressive series, at one end there will be the forms of practice which require a high degree of skill in medicine and surgery, such as that involving the treatment of kidney stones, brain tumors, and the severer forms of contagious diseases At the other end of the series there will be conditions of which everybody is supposed to have knowl-These conditions include the teaching of simple facts of hygiene in the common schools, the care of infants by their parents, and the simpler forms of sanitation and civic housekeeping The question arises, when does the practice of medicine by doctors, nurses and physical trainers become the practice of

medicine? This question has been one of the main sources of controversy in all misunderstandings between physicians and lay organizations

Doctors all agree that teachers must teach school children the elementary facts of physiology and hygiene, that physical trainers must take the lead in forms of correction in which muscular exercise plays the leading part, and that it is the function of public health nurses to teach the tuberculous and poorly nourished children whose parents are unable to feed them properly Doctors also recognize the need of organizations which will support the teachers, the physical trainers, and the nurses, and will carry on the work of educating and inspiring the people to have confidence in all workers in the public health field

The controversy between medical societies and lay organizations arises in their overlapping fields which have never been distinctly outlined and probably never will be An example of these border line questions is the determination of what constitutes the proper field of work of a nurse employed by the Metropolitan Life Insurance Ĉo A concise statement of what a visiting nurse should do under a dozen or more different circumstances was prepared by the insurance company for the guidance of its nurses and physicians Some county medical societies adopted the directions, while others hesitated to adopt them on the ground that the nurses were engaged in the practice of medicine (see page 1008) Practically all the conditions on the list were those of emergency in which a nurse would be censured by any doctor if she did not carry out the simple directions which are embodied It would seem that the question in the list involved was one of spirit and intention rather than of competition or encroachment on the peculiar field of the doctor

Physicians recognize the undeveloped stage of the standards regarding the lines of demarkation between the practice of hygiene and that of medicine There is need of more knowledge of what has actually been done in these Practically every phase of public two fields health work has been tried in some county, and there is experience enough to form a sane judgment of the value of these various forms The doctors have of work if it is collected assumed the leadership in some form of public health work in every county, they dominate the practice of all its phases in a very few If a survey were made of all the health work done in every county, the Committee on Public Relations would have a basis on which it could plan its activities

EDITORIALS 999

Mental surveys were made in 28 counties, and were published in this Journal during the years of 1924-25. At that time physicians had not taken up the practice of public health as a major activity of medical societies, but at present practically every medical society discusses public health at every meeting

Physicians can take a lesson from the methods followed by lay organizations. The leading field work of the voluntary health workers is public health education, which, in its more popular phases, is publicity, or even propaganda. The ethics of physicians provide that they shall educate the public in the scientific phases of medicine, but the same code of ethics frowns upon mere publicity and forbids propaganda, for it is publicity and advertising of one side of a question only

The survey of the public health work of a county would include that of the following

organizations

1 The physicians and their organizations, especially the county societies and the forms of activity which they are carrying on

2 The official organizations—the department of health and the department of education This field would include the work of the health officers, the school medical examiners, the sanitarians, and all other public officials engaged in public health work

3 The voluntary health organizations, of which the County Tuberculosis and Public Health Association is the leader There will also be included the Parent-Teachers Association, the Boy Scouts, the Girl Scouts, Public Health nursing societies, and the Red Cross

Every county has two or three forms of public health work well under way, but it is a question whether physicians of any county are entirely familiar with the work. It is only natural that the Public Relations Committee of the Medical Society of the State of New York should make a complete survey of every county in order to use that knowledge as a basis for advice to physicians regarding their relations to others who are carrying on public health work

LOOKING BACKWARD

THIS JOURNAL TWENTY YEARS AGO

Health Talks—Evidence that medical education of the people is a new idea is afforded by an editorial in this Journal of August, 1908, which records as striking news the fact that Dr Charles Stover had made a health address before the Amsterdam Board of Trade Dr Stover is still making health addresses on which new spapers and health journals gladly report, on account of their interior wints.

intrinsic worth The editorial says

"One of the hopeful signs of the times is the interest which municipal boards of trade are taking in medical matters Every industrial center of any consequence has its board of trade which is interested in furthering the business interests of the community. It was once felt that the work of the medical profession was entirely foreign, and often antagonistic, to the commercial spirit, but a decided change of view is now taking place The business men are discovering that the health of the community has a close relation to its business interests Factories, in which dust, crowding, and poor ventilation engender consumption among the employees, are discovering that as a business matter these conditions do not pay Municipalities are finding that a better prosperity accompanies a cutting down of the death-rate

"Last year the Board of Trade of Amsterdam, New York, invited Dr Charles Stover to read a paper on the relation of tuberculosis to municipal and industrial life This paper was of more solid value to that community than any of the other matter presented These gentlemen were alive to the importance of this subject as an economic question. Dr. Stover reported that in one of the public schools attention was drawn to the fact that many children had sore throats Investigation showed that the janitor had been instructed by a member of the board of education to close the ventilators in order to economize in the consumption of coal In another instance in one of the industries of the city there occurred an unusual number of cases of pulmonary hemorrhages It was thought that a very dry dust resulting from the manufacturing process carried on, was the cause of the trouble The proprietors gave one of the local physicians a free hand to suggest and apply a remedy By experiment and liberal expenditure of money, the introduction of apparatus steadily improved the sanitary conditions, and pulmonary hemorrhages became no longer conspicuous There can be no doubt about the commercial value of these life saving efforts"

MEDICAL PROGRESS

Spontaneous Heart Rupture—A Statistical Summary -A B Davenport, writing in the American Journal of the Medical Sciences, July, 1928, clxxvi, 1, presents a study of 92 cases of heart rupture The series includes 35 cases reported since the work of Krumbhaar and Crowell and 57 additional cases from the literature other than that which they consulted There is a remarkably close agreement in the percentages of the two collections age age of the patients at the time of rupture was 59 years, showing that spontaneous rupture of the heart is a disease of the aging. The most frequent site of rupture was on the anterior surface of the left ventricle In only 50 of the 92 cases was there a report of the condition of the coronaries In 30 of these 50 cases the rupture was definitely due to coronary disease, while 17 others presented conditions strik. ingly resembling rupture following coronary It is safe to say that spontaneous rupture is, in the aged, practically always the result of coronary disease with infarction exciting causes were varied, some being slight, others violent Six died during sleep and 4 appeared to be perfectly well before they unexpectedly fell dead The premonitory symptoms were too varied to allow of a definite diagnosis of impending rupture The period of survival after rupture was usually very short

The Scarlet Fever Problem -H Mommsen states that the recent work in the United States by the Dicks, Dochez, Zingher, and others has aroused new interest in the subject of scarlatina, but that the riddle of the latter is by no means The net gain in the work of the solved Americans is to have demonstrated fully that which was surmised by Bergé in 1893, that the disease is the result of the action of a streptococcus toxin, which naturally had as a consequence the preparation of an antitoxin and the possibility of the application of a test for susceptibility paralleled after the Schick test in diphtheria But on the other hand the evidence is against the true specificity of the hemolytic streptococcus in the causation of the disease This organism can cause disease phenomena which cannot be classed as belonging to scarlet fever and its position somewhat resembles that of the pneumococcus which can certainly cause croupous pneumonia and likewise other quite distinct affections, while other organisms are also able to cause croupous pneumonia Under such conditions the question of individual susceptibility to the disease concerned becomes of paramount significance A distinction may

readily be made among the contagious diseases between those in which a sort of anaphylactic susceptibility is a prominent factor and others in which this feature is not prominent In the "scarlatina group" the author places diphtheria, measles, varicella, typhoid, croupous pneumonia, etc, where sensibilization manifests itself in various ways. Here we find this oversusceptibility a greater factor than the bacterial invasion The patient in the opposed group may be run down in health and thus put up a poor fight against the invading germs, but in the anaphylactic group the patient may be in good general health and proof against ordinary bacterial invasion, but may show a special susceptibility to one or more organisms-Munchener medizinische Wochenschrift, June 8,

A New Type of Streptococcus in the Throat. -Dr W Lowenberg of the Rudolph-Virchow Hospital deals with an organism which bears a considerable resemblance to the intestinal streptococcus, better known as the enterococcus and quite distinct throughout from Streptococcus viridans, the pneumococcus, and others which appear to be denizens of the throat For some years the enterococcus has been known to occur as a pathogenic organism in localities other than the intestines—for example the gallbladder and urmary passages, and the author has sought to determine its presence or absence in the upper alimentary tract He took smears from the throats of 44 sound subjects and 6 additional ones from tonsillar crypts The finds were as follows a few showed hemolytic streptococci and all exhibited the viridans, while in 23 of the 50 smears there were organisms which strongly resembled enterococci Cultures of these showed many traits of the latter although There was no differences were also seen trouble in reaching the conclusion that the new organisms were not genuine enterococci although closely related to the latter. For the present the author designates them as pharyngococci At the first sight this discovery complicates a subject already sufficiently complex We as yet know nothing of its pathogenicity which may resemble that of the viridans in having little or no local action although capable if present in the circulation of setting up a It is of interest to note that form of sepsis since the author's discovery another bacteriologist has offered the opinion that the supposed enterococcus found in pyelitis might prove to be the pharyngococcus and cultural and other tests have shown the correctness of this supposition in at least one case of pyelonephritis. Hence some obscure infections of the kidneys may have been due to this new throat organism and not necessarily to the longer known cocci. The same may also be true of certain cases of cholecystitis—Klimsche Wochenschrift, June 17, 1928

Agranulocytic Angına —Hugh L Dwyer and Ferdinand C Helwig report a case of this peculiar blood dyscrasia in a boy, aged 6 years While under observation for anemia with enlargement of the salivary glands and spleen, he developed Vincent's angina, leucopenia, and loss of polymorphonuclear cells from the blood At about the end of the second month of his illness he was much improved, then following the extraction of a tooth all his symptoms returned and death ensued twelve days later Evidence of streptococcic septicemia was found at necropsy, bacterial emboli had invaded the heart Before the muscle, spleen, liver, and kidneys patient died the neutrophils completely disappeared from the blood and were not found in the tissue reactions in the inflammatory zones at necropsy There was no extensive lymphocytic or myeloid cell infiltration of the organs such as occurs in leucemia, and consequently no evidence that this disease was a primary disturbance of the myelogenous marrow tissues, and that the inflammatory condition was secondary to lack of resistance caused by the absence of granulocytes In 1922, Schultz reported 6 cases of a condition characterized by great diminution of polymorphonuclear neutrophils and associated with a gangrenous ulceration of the tonsils, and called the condition "agranulocytic angina" The disease chiefly affects women of middle age and usually terminates fatally The only cases occurring in children which the authors have been able to find were one reported by Schwarz, in which no autopsy was made, and another described by Rudolph Banz in a boy 41/2 years old Smears made from the lesions in the majority of cases show Vincent's spirilla and fusiform bacıllı, although a variety of organisms, such as hemolytic streptococci, staphylococci, colon bacilli, and Bacillus pyocyaneus, have been isolated The lesions are invariably present on the tonsils and pharynx, often on the gums, buccal walls, and tongue and about the geni-The reported cases show a variety of changes in the spleen, marrow, and lymph glands -American Journal of Diseases of Children, June, 1928, xxxv, 6

The Duodenal Tube as an Aid in the Surgical Treatment of Exophthalmic Goiter—In a preliminary report of some 30 cases, Arnold S Jackson points to the advantage of using the duodenal tube in introducing iodine, glucose,

and orange juice before, during, and after operation for exophthalmic goiter. In his experience it has proved the most important factor in modifying postoperative reaction since the introduction of iodine He believes that with proper care primary thyroidectomy may be performed in the majority of cases in which it is indicated For the past two years he had given each patient 30 gm of glucose and 100 gm of orange juice two hours before operation, together with Lugol's solution, four doses of 10 Although the degree of postopdrops each erative reaction was considerably modified by these measures, there remained a group of cases that caused some apprehension—those who were troubled with mucus and repeated In these the iodine, glucose, and orange juice may be administered by means of the duodenal tube This is introduced the afternoon before the operation to enable the patient to adjust himself to the tube, and at the same time the Murphy drip gives assurance that fluids, nourishment, and iodine are being The duodenal tube is attached by a rubber tube to an ordinary proctoclysis can suspended on a standard As a rule the tube is withdrawn in 48 hours, occasionally it is removed sooner or allowed to remain an-The tube is not used in all cases, but only when more than the usual postoperative reaction is anticipated. To those who only occasionally operate for exophthalmic goiter the tube is recommended as a helpful measure for either the ligation stage or thyroidectomy Since using the tube the postoperative reaction in the author's cases has been negligible --Annals of Surgery, July, 1928, lxxxviii, 1

Endocrine Disturbances and Menstruation — Professor Ed Martin of Elberfeld refers to affections of the endocrine system which lead to irregularities and menorrhagias. The patients under consideration are not supposed to be suffering from inflammatory or neoplastic conditions in the inner genitals or from the consequences of inflammatory affections, and it is necessary as a rule to exclude all organic disease by exploration under narcosis The author brings out his ideas of treatment by brief case histories The first patient had begun to menstruate after her first confinement and had shown a tendency toward flooding. The diagnosis of the first physician was that something had been left behind after delivery which indicated the curette, but the menorrhagia continued after this had been used Another physician also used the curette as did a third one, all with the same negative result In passing it may be stated that not one of the three practitioners thought it worth while to make a microscopic examination of the scrapings This case does not seem to have come under the

author's care Four cases are now given from the author's practice A girl of 15 who had menstruated for 2 years showed a tendency to irregularity and menorrhagia. The condition subsided when the patient went on a fourweeks holiday, recurred with return to school life, subsided again when she was sent to a life at a high altitude and in free air Subsequent pelvic examination showed the genitals in perfect condition. Although the author regards the mechanism of these cases as endocrine he does not prescribe any organotherapy—merely altitude, rest, sun, salt baths, etc, the measures resembling closely those used in the tuberculous Several months of this form of treatment were sometimes neces-In one passage the author speaks as if these patients might benefit under corpus luteum and anterior pituitary extracts but he does not seem to have used them even as a test -Deutsche medizinische Wochenschrift, June 15,

Legg's Disease in Its Late Stage ——After outlining the well-known picture of Legg's disease in childhood, Solomon D David questions whether certain cases of this disease do not subsequently develop chronic or degenerative arthritis with hypertrophic changes, masmuch as the alterations in the shape of the femoral head in this latter disease are very similar to those characteristic of Legg's disease He reports 5 cases in patients ranging in age from 15 to 45 years In these cases the great trochanter lay above Nélaton's line, there was limitation of motion, with or without shortening, mushrooming of the head of the femur, and other deformities in the neck of the femur and acetabulum In one case there were distinct arthritic changes which might easily have led one to assume that the case was one of infectious or hypertrophic arthritis In this case (as well as in the others) the trouble was of many years' duration, while osteo-arthritis is a disease of the middle or late period of life The x-ray findings were similar to those of Legg's disease It is highly important to differentiate between tuberculosis and Legg's disease, since the former has a very guarded prognosis and protracted therapy. The differentiation of Legg's disease ought not to be difficult, as the roentgenogram is characteristic. The important question is the ultimate fate of such deformed hips, and whether the proper care of Legg's disease in its inception has any bearing on its future course These questions are propounded to stimulate further study of the course of this disease The treatment of Legg's disease consists in the application of supportive measures, correction of body mechanics and, if the symptoms are too severe, rest in bed -Southern Medical Journal, July, 1928, xxi, 7

The Allergic Chamber in the Treatment of Allergic Diseases -W Storm van Leeuwen of Leyden, who first introduced this method of treating the allergic diseases in 1925, has now a record of 600 patients treated His conclusions based on this extensive experience are as follows The chamber is of great diagnostic value for if it be shown that it can for the time put a stop to asthmatic attacks which recur after discontinuance of treatment we may be sure that the climatic factor will make it necessary for the patient to remove permanently to a climate free from the specific aller-But he may remain in his home if he install a cabinet in his dwelling, and it will not be necessary for him to remain in it permanently He should sleep in it of course and remain in it several of his daily waking hours If the asthma is of occupational origin the chamber will of course be of no value In cases due to local allergens which are unrelated to climatic allergens the patient may get relief by a change in his sleeping quarters Taken as they come, 90 per cent of the cases of asthma respond to treatment in the allergic chamber In the present paper the author makes no extended report on bronchitis, hay fever, whooping cough, and tuberculosis, but separate reports have been published by him on whooping cough and tuberculosis—where, unlike asthma, there is hope of a permanent cure -and his silence as to hay fever means doubtless that it is not suited to the allergic cham-The latter treatment may of course be given in association with desensibilization through treatment with the specific allergens, with the use of foreign proteins, etc -Deutsche medizinische Wochenschrift, June 8, 1928

Interruption of the Venous-Lymphatic Circulation in Acute Septic Infection -Professor P Clairmont of the Zurich University Surgical Clinic discusses this entire subject from the angles of ligation, resection etc., including the treatment of suppurating thrombosis Four cases are given with two recoveries, while autopsy on the others suggested that they might also have been saved The complications in some of these cases are numerous and varied, as in a tonsillar abscess with metastases to the lung and brain and right empyema, yet the mischief was due entirely to thrombosis of the anterior facial vein extending to the jugular In this case the patient reached the hospital much too late for intervention. In another fatal case due to furuncle of the lip, there was probable thrombosis of the same vein and also lymphangitis The author, after conservative treatment of the boil had proved unsuccessful, cut down on the jugular but found it still intact Autopsy showed metastases to the lungs and posterior mediastinum although there was

The mechanism of not much pus formation death seems to have been somewhat obscure, infectious germs having reached the circulation through lymphatics or some of the deeper venous twigs, although early intervention might have saved the patient. The next case. in a healthy boy of 4 years, began as an infection of the cheek with a phlegmon of the neck and impending mediastinitis made sure that the external jugular was still intact the author established drainage and excised the submanillary lymphnodes Although virulent streptococci were already in the general circulation the boy pulled through last case was one of infected hand in a physician resulting from an autopsy on a peritonitis case with beginning general streptococcus infection Numerous incisions in the arm interrupted the lymphatic circulation and this, with excision of the primary wound, led to recovery -Schweizerische medizinische Wochenschrift, June 2 1928

Is Appendicitis Ever Contagious?—A Fonio and Rieder of Berne attempt to throw light on this possibility by the use of statistics We know that at times it appears in epidemic incidence and the authors give examples of numerous small epidemics or endemics in Cases often accumulate in local Switzerland hospitals and the patients are found to come from certain areas to the exclusion of others In summing up a very long article the authors cite the figures of patients operated on in their Of 667 such cases 49 per hospital services cent suggested possible contagion If in any family, household, or small community there is seen a tendency to cumulation one should think of the possibility of latent cases and be alive to the importance of recurrent abdominal The authors believe pains, tenderness, etc that in the spread of the disease there will often be found an intermediary who suffers from a latent case and who may be responsible for conveying the disease to sound subjects The "third person" of the authors is not to be compared of course with the healthy carrier-in fact there is no way in which the latter could be recognized—but serves the same Such a person may give a history of a mild attack in the recent past or may be suffering at the time from a so-called latent If such patients could be rounded up and submitted to appendectomy the number of cases in a small community should diminish The paper comprises a wealth of material, such as 7 brothers and sisters developing the disease within the space of 5 years with one member of the household not related, making 8 cases in one family In another family 9 patients operated on within 13 years, and in a third family 6 cases in 5 years. The total number of family epidemics known to the authors is to date seventeen—Schweizerische medizinische Wochenscrift, June 16, 1928

Ultraviolet Ray Therapy -In describing the ultraviolet rays and their action in the body. E P Cumberbatch emphasizes the fact that there are various kinds of ultraviolet rays with different wave lengths. These rays have very different penetrating powers. It is evident from the complicated nature of the rays that they should be employed only by a physician trained in their use. The biological effects of the ultraviolet rays are those which follow physiochemical changes brought about by Apart from their power to activate cholesterol and increase absorption of calcium and phosphorus, and perhaps their power to increase resistance to infection, none of the known therapeutic properties of the ultraviolet rays are peculiar to them. Of the various type of apparatus, Cumberbatch prefers the mercury vapor lamp For general treatment it is necessary to expose the entire surface of the body or large areas of it With the patient in the prone position and the light three feet above the body, the posterior surface is exposed for two minutes and then the anterior The time of exposure is increased by one-half minute up to ten minutes children one minute is given at the first visit, in infants, one-half minute The diseases which may be treated by the ultraviolet rays may be classified into three groups (1) Those in which treatment will always effect a curerickets and tetany and laryngismus in rachitic children, (2) those in which treatment will generally effect a cure, alone or with other forms of treatment—children unable to assimilate their food, those who have been subject to fevers, nasal and bronchial catarrh aural discharge, and debility following influenza, surgical tuberculosis, or other diseases, and also infectious skin diseases, such as impetigo contagiosa, acne vulgaris, weeping eczema (not true eczema), indolent ulcers, erythema pernio, (3) obstinate chronic diseases which resist drugs The treatment of chronic fibrositis and arthritis has been disappointing Better results have sometimes been obtained in obstinate sciatica and brachial neuritis, hyperpiesis, bronchial asthma, hay-fever, Raynaud's disease, and acrocyanosis The ultraviolet rays should be used with extreme caution when the body temperature is raised, they should not be used in pulmonary tuberculosis, heart failure, Bright's disease, during menstruation or in very aged persons -British Medical Journal, July 14, 11, 3523

LEGAL

By LLOYD PAUL STRYKER, ESO. Counsel, Medical Society of the State of New York

"BOOTLEG INSURANCE"

One of the valuable results flowing from the Eighteenth Amendment and the Volstead Law consists in the increase of our vocabulary The words "bootleg" and "bootlegger" in the past ten years have achieved a meaning which everyone understands To "bootleg" means to illegally engage in a business, either by carrying on a commerce which the law condemns, or carrying on a legal business in an illegal manner

In the New York Tribune of July 5th of this year, the subject of "bootleg insurance" was interestingly discussed. It seems that this has become a growing evil in the State of Con-

necticut The article is as follows

"Dunham Issues Warning on Bootleg Insurance' Connecticut Commissioner Says Collections Are Difficult"

"The growing evil of 'bootleg insurance' has caused Howard P Dunham, Insurance Commissioner of Connecticut, to sound a warning dealing with the dangers of doing business with unauthorized companies Dunham stated that the Insurance Department has been asked from time to time, by residents of Connecticut, to help them collect a damage or loss claim against an insurance company not licensed to do business in that state, and that in each case information has been given that the department was powerless to render assistance

"'There are many persons in Connecticut,' Mr Dunham pointed out, 'who apparently do not realize that the Insurance Department has no jurisdiction over companies which cannot legally operate in Connecticut. event of failure to settle a claim, the unauthorized carriers cannot be sued in the Connecticut courts, they must be sued in the state in which they are domiciled This is an expensive and difficult process for the average

person

"Mr Dunham stated that 'bootleg insurance' is chiefly handled by mail and that prospects are circularized by companies with no authority to operate and who hold out the attraction of a lower premium than that charged by the legitimate companies amount of business transacted is impossible to estimate, but the size is sufficiently large enough to cause concern, it is believed

"'Insurance agents in Connecticut are not

permitted to place business in unauthorized companies under heavy penalty of fine and imprisonment,' Mr Dunham said, and concluded his statement by saying 'that the placing of insurance with such a company is no longer permitted under any circumstances Cases in which adequate coverage in licensed companies cannot be obtained are extremely rare,"

Our New York statutes are clear and precise as to the rights of foreign insurance companies (that is, insurance companies organized in other States) to do business in our State Our New York law declares that no insurance com pany organized under the laws of any other State or country "shall transact any business of insurance in this state, unless, * * * it has deposited with the superintendent of insurance for the benefit and security of its policyholders in the United States, a sum not less than two hundred thousand dollars * * * *" (Insurance Law, Sec 28) Such a foreign corporation must likewise file "in the office of the superintendent of insurance a certified copy of its charter * * *," (Sec 29), and shall not transact any business of insurance in this State "until it has executed and filed in the office of the superintendent of insurance a written appointment of the superintendent to be the true and lawful attorney of such corporation in and for this state, upon whom all lawful process in any action or proceeding against the corporation may be served with the same effect as if it were a domestic cor-Service upon such attorney shall poration thereafter be deemed service upon the cor-(Sec 30) poration'

The Penal Law declares that "Any person acting for himself or for others, who solicits or procures, or aids in the solicitation or procurement of policies or certificates of insurance from, or adjusts losses or in any manner aids the transaction of any business for, any foreign insurance corporation, which has not executed and filed in the office of the superintendent of insurance, a written appointment of the superintendent to be the true and lawful attorney of such corporation in and for this state, upon whom all lawful process in any action or proceeding against the corporation may be served, is guilty of a misde-meanor" (Penal Law, Sec 1199)

The insurance carrier under our Group Plan

is a Connecticut corporation which has complied in every way with every requirement of our New York statutes. The success of our Group Plan is now too well appreciated and understood to require further comment. Yet occasionally, it has happened that some isolated member of our Society has seen fit to insure himself elsewhere. This, of course, is his privilege. But we deem it our duty to convey the warning that coverage taken in a foreign corporation not authorized to do busi-

ness in this State, may leave the physician in an unfavorable position in the event of a difference between him and the foreign company in which he has been prevailed to insure himself. A foreign corporation not authorized to do business in this State, is not under the jurisdiction and supervision of our New York Insurance Department. In the event of a failure on the part of such a company to meet its obligations, it cannot be sued in the courts of this State.

REMOVAL OF A TUBERCULAR KIDNEY

It was charged that on the 8th of March a surgeon undertook to operate upon a patient and to remove the left kidney That in the performance of such operation he was negligent and careless, causing the patient extensive injuries and requiring that he expend further sums for medical treatment to be relieved of the injuries was further charged that the defendant had failed, after the operation, to continue to treat the patient even though he had been repeatedly requested by the patient to render the necessary treatment. That by reason of the failure of the defendant to render the necessary aftercare the patient claimed that the wound remained open for a considerable length of time and the patient's general condition became very poor and his health was seriously impaired. That he was required to expend over \$4,000 in an endeavor to be healed of the injuries caused by the defendant's neglect and carelessness

On the 8th of March the patient had called on the defendant surgeon at his office, complaining of pain in the left kidney After examination the surgeon advised that the patient was suffering from a tubercular kidney and further advised his entry in the hospital for the removal of the kid-The operation was performed, the kidney being removed After the bleeding had been controlled, a cigarette drain was placed in the The wound was then sutured and dressed with sterile dressings. While the patient was confined in the hospital he was seen daily either by the surgeon or his assistant and the necessary aftercare rendered in the treatment of the operative wound. About three weeks afterthe patient had left the hospital he called on the surgeon at his office On examination it was found that the wound, while healing, had not entirely closed At that time the surgeon dressed the wound, leaving a drain in The patient did not again return to the surgeon. Nothing further was heard from him until the institution of the malpractice action

From a report of a physical examination, made of this patient after the institution of the action,

it was disclosed that the patient had originally been attended by his family physician and a diagnosis made of tubercular kidney That he had also had various other consultations and finally consulted the defendant surgeon who advised and subsequently performed the operation upon the kidney While at the hospital, where he remained for a period of seven weeks, he was seen daily either by the operating surgeon or his assistant The sutures were removed from the wound eight days after the operation However, there was no union or healing and the wound was wide open at that time and had to be treated subsequently by allowing it to granulate. The patient said that the surgeon whom he called occasionally looked at him and said he was getting along all right and let it go at that. After leaving the hospital the patient had gone to a hotel in the country under the care of a nurse, where he had stayed for about four months While able to go about he was unable to do any work and the wound had to be irrigated daily with an iodine solution, balsam of peru was also used in the dressing during this time. In the following July he went to another physician who apparently had criticized the work that had been done by the surgeon and physician who had previously attended the patient This physician stated that he did not believe that the sutures should have been removed in eight days and that there should have been applications of nitrate of silver and other similar applications made to the wound to hasten granulation The criticisms by this physician of the previous treatment tended to mentally disturb and aggravate the patient's condition

The physical examination of the patient showed him to be a short, rather sturdy, good-looking Roumanian Hebrew, with a large rotund abdomen, weighing about 170 pounds, 5 feet 4 inches tall and the picture of good health. The patient claimed that he had weighed 150 pounds prior to the operation. The examining physician felt that the patient's trouble was a mental condition aggravated by the criticisms of the physician who had last attended him. He appared to be of the

1006 LEGAL

typical European type, nervous, hysterical, introspective Hebrew Superimposed upon the mental condition was the operation which aggravated his previous condition. At the time of the examination he showed an operative wound scar on the left side of his body just above the left iliac crest The wound begins on the left side of the abdomen and extends around the body towards the back 7 inches, is partly healed at the present time, about 4 inches all told On the anterior portion of the wound at about the border of the umbilical and left lumbar region, there is still present an open wound area about 1 inch long with a deep sinus extending downward about 1½ inches The last physician who had attended him had probed the sinus The posterior sinus, which is on the lateral side of the body between the last rib and the crest of the ilium, is about 2 inches long and 5 inches deep. The sinus goes down to the old socket or base of the kidney At the time of the examination there was inserted into this wound a large grooved director with cotton and iodine thereon The examining physician felt that this was the worst part of the patient's condition at the present time and would take a long while to heal up and will have to granulate 5 inches from the bottom. At the time

of the examination the wound was discharging and a dressing had to be kept on continuously

The examining physician found that the then attending physician, while stating that the patient's physical condition was improving, that his attitude was distinctly critical even to antagonism The examining physician further felt that the condition operated upon was a very bad one and that if the operation had not been skillfully performed with a complete removal of a very bad abscessed kidney, the patient would have gotten an extension of the process with undoubtable resultant death He finds that there is no extension of the process to the bladder The examining physician further felt that cases of this description run a long time as tubercular cases are chronic in character and he has no doubt that a sinus or fistula would have been a very beneficial thing to have been kept open after an operation of this description

This action finally came on for trial and after the submission of the plaintiff's case, the physician who last attended him testifying in his behalf, the plaintiff having failed to make out any cause of action, on motion of the defendant the complaint was dismissed

ACUTE GASTRO-ENTERITIS AND NEPHRITIS

A physician was called to attend a female patient 71 years of age The history of the patient's illness was that four weeks prior, she had a severe attack of vomiting and diarrhea which started at about 2 am after eating shrimp for dinner, and lasted about 24 hours, that the pain began in different parts of the abdomen, and has been continuous for three or four weeks. She was habitually constipated The patient stated that she feels nauseated after taking food or on. waking up, and feels pains in the epigastric region, rather a soreness than a piercing or gripping She has had diarrhea on and off for the last ten years, and has had similar attacks with diarrhea and distension about every six months, but not so severe, lasting two days

Examination of the patient showed a blood pressure of 185-78, pulse 120, respiration 36, temperature 996, a stout woman, dry thick tongue, mucus in throat, tissues of the legs look poor and slightly edematous. The heart sounds were O. K. The abdomen was greatly distended and tympanitic, a high stomach and apparently dilated. She was somewhat tender over the right side of the abdomen, but no rigidity. There was no visible peristalsis, and distension was regular No masses were felt, and it was practically im-

possible to palpate abdomen satisfactorily The patient had a rectovaginal fissure, a perineal tear

After this history and examination, a diagnosis was made of acute gastro-enteritis and acute nephritis. On May 22nd, the distension was slightly better. The patient, however, complained of pains in the abdomen, and seemed depressed and exhausted. Medication was administered, and hot applications applied.

On the following day, the patient was very weak and exhausted, and looked cyanotic Colonic irrigations were administered Passage of small amount of gas, and some solid feces was

expelled

On May 24th, at about 1 a m, the patient collapsed 1 cc of pituitrin was administered, and camphor in oil. The patient, however, died at 3 a m on May 24th. At the time of the death of the patient, the family had no complaint, and expressed their satisfaction with the treatment rendered by the physicians, and paid the physicians' bills

Shortly thereafter, a suit was instituted against both physicians by the administrator, charging negligence in the treatment of the patient, causing her death. The suit was never pressed and subsequently was discontinued.

2

LONDON LETTER

MATERNAL MORTALITY

Her Majesty the Queen of England, with her characteristic sympathy with her subjects in all matters of health, in a message which she sent to the Maternal Mortality Conference, held in London in February this year, declared that she viewed with great concern the continued high rate of maternal mortality, and felt that a real endeavor should be made to remove this reproach from our national life Such a message as this could not fail of a response, and a movement has started to investigate the subject and find a The British Government has decided to set up two Departmental Committees, one to deal with maternal mortality, and the other to investigate the subject of midwifery, and much interest has been shown in Parliament and in medical circles

The outstanding fact is that in the British Isles nearly 3,000 mothers of a total number of 750,000 lose their lives annually at childbirth and this number has not varied much for many years. The Registrar's General Statistical Review for the years 1916-1926 inclusive, show but little variation. The best year was 1918 with 2,509 deaths, the worst was 1920 with 4,144 deaths. In 1926, the last year reviewed, there were 2,860 deaths.

What are the factors which cause this lamentable mortality from what is considered a purely physiological occurrence? On looking at the returns one finds that puerperal sepsis and albuminuria account for 60 percent of the deaths, and of these sepsis is twice as deadly as albuminuria, it follows then that if we control this potent cause of mortality we must attack the problem before the actual birth of the child This is being done by the founding of antenatal clinics of which there were 675 in England and Wales in 1925 and nearly 800 to-day these clinics there is opportunity for (1) the diagnosis of the pregnancy and the fixing of the probable date of confinement, (2) examination as to general fitness for pregnancy and labor, (3) watching for signs of puerperal toxoemia (4) measuring the pelvis and (5) detection of abnormal presentation and its correction (W M Feldman)

Unfortunately, there is a very general disinchination on the part of pregnant women to consult these clinics, which are therefore doing but a very small part of the work they could do. It it, of course, purely a matter of education, and as the advantages both to mother and to child of ante-natal precautions become better understood we may reasonably expect a great improvement in the attendance

The deaths from puerperal sepsis have remained stationary and are not confined to one They affect rich and poor, town and country, private or hospital, whether the cases have been attended by doctors or midwives. The mortality in the large Lying-In Hospitals still amounts to 1.20 per thousand (Eden), a rate not differing much from the general rate has the incidence of sepsis varied since the Midwives Act of 1902 which made registration, instruction and supervision of midwives compul-There is very little difference between town and country, for though total maternal mortality is higher in rural than in urban areas, the mortality from sepsis is lower in the former When one considers the in than in the latter sanitary conditions which prevail in the lying-in rooms of so many of the poorer mothers, one cannot help feeling that if more women could be admitted to well run lying-in institutions the mortality figures would be lowered

In the British Isles mothers are not yet willing to leave their homes, and we find that of the average number of 750,000 births only some 20,000 take place in maternity institutions

But there are causes of mortality other than sepsis, and one realizes that the mother's chances of recovery from hemorrhage, ectopic gestation and phlegmasia alba dolens, to mention a few of the accidents of childbirth, would be enhanced by admission to a maternity institution. There is also the very large question of invalidism resulting from childbirth. It is impossible to estimate this incidence, but in this perhaps more than in any other aspect of this great question one can see the value of skilled supervision during the puerperium and the actual child birth

In connection with Maternal Mortality it is of great interest to read the Regulations for Admussion to the "Mastery of Midwifery," just published by the Society of Apothecaries of The first examination will take place in the autumn, and it is obvious from the regulations that the standard of knowledge and practical proficiency demanded will be a high one Candidates, besides being fully qualified, must have held a resident post of six months in a recognized obstetric hospital, in addition they must have attended, for at least three months each, a recognized ante-natal clinic and an infant welfare centre The examination will consist of written papers, a clinical test, and an oral examination

NEWS NOTES

THE COMMITTEE ON PUBLIC RELATIONS

The Committee on Public Relations of the Medical Society of the State of New York, held its organization meeting on July 7th, in the Albany offices of the State Society at 100 State Street, Albany The members of the Committee who were present were Dr James E Sadlier, Chairman, Dr Harry Trick, President of the State Society and member ex-officio, Dr A J Hambrook of Troy, Dr W D Johnson, Batavia, Dr O W H Mitchell, Syracuse, and Dr W H Ross, of Brentwood Dr Ross was appointed secretary of the Committee

Doctor Sadlier, the Chairman, said that he would call upon each member of the Committee to express his own views regarding the scope of the work of the Committee He suggested that the Society should have two objects in mind 1—To secure the appointment on the public relations committee in each county medical society, 2—To divide the state into five districts, each to be under the direction of a member of the State Committee

Doctor Trick called attention to the overlapping fields of the trinity of the public health organizations in this state,—the doctors, official departments of health, and the voluntary health organizations. It would be the duty of the State Committee on public relations to determine the fields of activity of these organizations and to direct their activities so that they will go on harmoniously and without overlapping

Doctor W D Johnson brought up the point of the standing orders which the Metropolitan Life Insurance Company had issued to its field nurses. He said that while a number of county societies had approved these directions, his own county society of Genesee had not done so on the grounds that the directions imposed a certain degree of the practice of medicine upon the nurses

Some of the controversial points brought up

by Dr Johnson were Under the topic "Elevated Temperature,"

the suggestions to the nurses were 1 Put the patient to bed

2 Urge the importance of quiet and rest

3 General isolation retained if communicable disease is suspected

4 Liquid diet, plenty of water

5 Sponge for temperature for 102 to 105

6 If patient is suffering from abdominal pain, nothing is to be given by mouth until the patient has been seen by a doctor

Under the topic "Infants and Children With Elevated Temperature," the following instructions were given to the nurses

1 Put to bed, isolate, give boiled water

2 Normal salt colon irrigation if system suggests constipation

3 Urge calling doctor if temperature does not drop after irrigation

not drop after irrigation For "Infantile Convulsions," the following suggestions are made for the nurse to carry out

1 Hot baths with gentle friction of skin

2 Hot saline irrigation

3 Ice on head

4 Discontinue all food, give boiled water only

5 Call a physician immediately

These are samples of directions which the Metropolitan Life Insurance Co nurse is to follow when she makes her first visit

Doctor Johnson said that he reflected the questions which were in the minds of some physicians of his county, but felt that possibly a nurse who carries out these directions would be considered to practice medicine. The Committee made no decision on these points, but preferred to wait and see how the nurses actually carry out the directions.

Doctor Mitchell said that the Public Relations Committee would undoubtedly be called upon to settle disputes and differences of opinion, and he suggested that if possible the committee should profit by its experience of the past year, and devise a plan for anticipating disputes and settling them before they have acquired large proportions

Doctor Hambrook spoke of the necessity that the doctors should make haste to catch up with the public health program which is already established by the lay organizations. Physicians can readily assume their proper leadership in all public health activities, and could dominate the public health field if they were alive to their responsibilities and opportunities.

Dr W H Ross spoke of the need for establishing a program and principles to govern the activities of the committee. There was not much precedent to guide physicians in developing public health work. They must think out new steps according to the light of their own experience. Physicians must also engage in the work before there was time for disputes to arise or for other organizations to assume a leadership along impractical lines.

There was considerable discussion regarding the activities of lay organizations along the lines

of diphtheria prevention, the management of tuberculosis sanatoriums, the promotion of county health units, the establishment of mental hygiene climes, and the direction of public health nurses. All these activities are the functions of physicians, and should be under their leadership and direction. It was the opinion of the members that steps should be taken to interest the doctors in all these various activities so that the medical profession will assume its leadership

The committee agreed to work according to the eight general principles for the government of the conjoined work of the medical profession and the voluntary public health agencies adopted by the House of Annual Delegates meeting in Albany These principles are printed in the Journal of May 1st, page 495. They were accepted by the joint committee of the State Medical Society and the State Charities Aid Association regarding the conditions in Cattaraugus County

The committee also approved of the program which was devised by the Committee on Public Relations on June 17, 1927, as a guide for a County Society's activity (See this JOURNAL, July 15, 1927 page 797) This program consisted of the following five headings

"1 Make a complete survey of health agencies in the county, noting the names, membership, program, and manner of carrying on same "2 Collect data concerning all types of medical activities, both curative and preventive, and whether promoted by official or unofficial agencies

"3 Confer with the director or proper committee of every agency or organization interested in conducting or promoting curative and preventive medical activities in the county, with regard to its program, for the purpose of offering assistance in the development of the medical phase of such program

"4 Confer frequently with the public health committee of the county society regarding the methods employed in public health work throughout the county

"5 Be prepared to take leadership in developing medical programs of county agencies"

It was the unanimous opinion of the members of the Public Health Committee that a full account of the work of the committee should be published in the New York State Journal of Medicine and that some phase of its work should be written up for each issue. Since Doctor Ross is Chairman of the Committee on Publication of the State Society, and is also Secretary of the Committee on Public Relations, the publicity regarding the committee was placed under his direction.

HEALTH OFFICERS' CONFERENCE

Do the physicians of New York State take an interest in the practice of public health and civic medicine? The answer is found in the Twenty-seventh Annual Conference of the Health Officers of New York State, held in Saratoga Springs, June 26, 27, and 28, 1928, under the auspices of the State Department of Health About 500 physicians who were also health officers came together to discuss the practice of public health

The Tenth Annual Conference of Public Health Nurses was held at the same time at which the attendance was over 600. The total registered

attendance was 1180

The attendance of the physicians at the Health Officers' Conference compared favorably with that of the physicians at the Annual Meeting of the Medical Society of the State of New York, with this difference—whereas the attendance at the Medical Society meeting was mostly from the cities, the physicians attending the Health Officers' Conference came more from the rural districts

The general impression was that the Conference was the best of all It was held in the Grand Umon Hotel, as usual, which was large enough to house all those present and to entertain them in its large dining room. The Hotel had the fur-

ther advantage in that a large parlor was available for the exhibits. This parlor was located between the main office and the dining room, and everybody passed through it several times a day

The prominent feature of the Conference was an exhibit of posters prepared by high school students as the result of a contest for the best picture illustrating the anti-diphtheria campaign. This contest will be described in a future number of the Journal

The annual dinner of the health officers and public health nurses was held as usual. One of its best features was a large number of short speeches reporting public health advances in various parts of the State.

The program of the meetings covered about four pages of the official announcements Dr Harry Trick represented the New York State Medical Society in an address in which he stressed the need that practicing physicians should

engage in public health work

Dr Matthias Nicoll, Jr, State Commissioner of Health, spoke of the close relations of the official departments of health to the practicing physicians and their official organizations, and of his gratification at the harmony which exists between departments of health and physicians

Dr Thomas Ordway, Dean of the Albany Medical College, described the plans of the College for conducting post graduate courses for practicing physicians, especially those who are located in the northeast corner of the State. He said that the majority of physicians in twenty-two counties had graduated from the Albany Medical College, and that the College felt the responsibility for their continued medical education. The definite plan of action was nearly completed and will be announced in the Fall. Dr Ordway also said that an abundant endowment had been provided to carry on the work.

Miss Ruth Taylor, Deputy Welfare Commissioner of Westchester County, spoke on the subject of "Cooperation Between Official Health Departments and Voluntary Health Agencies" She was diplomatic in her avoidance of controversial subjects, but she presented the principle of action of the two groups of organizations clearly and satisfactorily. However, her meaning was not always clear. She stated, for example, that if the private agencies were not told of their faults, they would continue to repeat them, but she offered no practical way by which physicians or health officers might undertake the correction

of the faults without giving offence

Dr Haven Emerson spoke on the subject of "Public Health as a Private Responsibility" He referred especially to the active practice of public health by private physicians, and said that the background for this practice is only about five years old, it having been established by the American Medical Association in 1922 when the annual meeting proposed the periodic health examination as a prominent activity of physicians Public health activities during the last five years have shown a drift toward the active participation of family physicians in its practice Dr Emerson made the surprising statement that the time devoted by doctors to diminishing or preventing the disease was equal to the time devoted to its cure It hardly seems possible that this is true, and yet it seems probable when one considers the time which a family physician takes in explaining the causes of a disease to his patients and the manner of its prevention

Dr Emerson also said that official agencies had almost reached the limit of their ability to advance the cause of public health without the help of family doctors and the voluntary agencies. It is becoming more and more true that the practice of preventive medicine in the future will be done principally by practicing physicians. The official departments of health have gone about as far as they can, and further progress lies with family physicians.

Speaking of the public health examination, Dr Emerson stated that the average healthy person should have about seventy-five contacts with the doctor in the course of a lifetime. He list these contacts as follows.

- 1 Prenatal, 5
- 2 Age from birth to six months, 6
- 3 The next eighteen months, 6
- 4 From that age to six years, twice a year
- 5 From six to sixteen, once a year
- 6 From sixteen to thirty-six, once a year when defects are present or the person is engaged in a hazardous occupation
- 7 From thirty-six to old age, according to conditions

All these examinations are to be made by the family doctor. They are not intended for treatment, but to adjust the individual to his environment. Examinations are now fostered by clinics and departments of health, and are made in groups. The next step will be to teach each person to have examinations done at his own expense, and to buy this service from the physician.

A striking part of the Conference was an explanation of the new milk code by Dr Frank Laidlaw, District State Health Officer Dr Laidlaw has spent much time teaching the health officers of Orange and Ulster Counties how to carry out the provisions under the new regulations and interpreting their meaning. His explanation of the regulations at the conference was along the lines which he had already proved practical in his private dealings with the health officers.

While general conferences were held each day at which both health officers and nurses were in attendance, there were special conferences and round table discussions for the purpose of instructing special groups, such as the industrial nurses, the school nurses, the red cross nurses, the social hygiene nurses, the health nurses in towns and small villages, and the registrars of vital sta-Every feature of the Conference was practical, while the plan of holding all features of the Conference under one roof enabled those in attendance to discuss special points with one another and to enjoy the sociability of the parlors and porches The plan of the Conference might well be considered by the Medical Society of the State of New York in forming its plans The three day conferfor the annual meetings ence was marked with sociability, because the elements for promoting good fellowship were pres-Some doctors said that the annual conference was the enticement that led them to continue as health officers of their communities

MEDICAL RESERVE OFFICERS' SCHOOL

By COL CHARLES R REYNOLDS, M D

Commandant, Carlisle Barracks, Pennsylvania

The sixth summer camp course of training for Medical Department Officers of the Reserves of the United States Army, was held in the Medical Field Service School, at Carlisle Barracks, Pennsylvania, from July 8th to the 21st, and was attended by 347 officers New York has always been well represented at the school, and this year twenty Medical Officers were present from New York City and vicinity

The class was divided into two groups, and two rather distinct courses of training were conducted concurrently The first group consisted of about 300 officers who were assigned chiefly to medical regiments in the Organized Reserves Ten medical regiments and one evacuation hospital were represented in this group. The officers of this group who were not assigned to medical regiments were attached for training purposes to the several medical regiments in camp The first week's training was general in nature and was intended to bring the officers up to a state of preparedness for the terrain exercises which featured the remainder of the course. This large group received what is known as unit training which was given under the immediate direction of the commanding officer of the reserve medical regi-They not only had this responsibility, but the authority that should naturally accompany it A military situation involving the medical service of a command engaged in a planned attack, defense of a position, withdrawal and pursuit was drawn up by the faculty of the Medical Field Service School This served as the basis for four terrain exercises in which the officers assigned or attached to the various medical regiments made a study of the general and special situations, an actual reconnaissance of the field, and formulated the necessary field order which would place their medical regiments into position for service with imaginary forces The terrain exercise has been found to be the most suitable method of conducting unit training In such a procedure, the commanding officer of each unit is required to make his reconnaissance, his decision, to write his order and to carry on in a manner as if he were surrounded by his own troops in the presence of the enemy

The group which received special training in military sanitation consisted of 46 officers and was composed largely of officers engaged in some phase of sanitation, such as sanitary engineers health officers of civilian communities, teachers of or research workers in bacteriology, nutrition, chemistry, etc. The training given this group was designed to illustrate and demonstrate the application of their special knowledge in military situations. The program of instruction comprised a series of lectures, conferences and demonstrations.

culminating in two terrain exercises illustrating the application of the principles of preventive medicine to the service of troops in the field

The special "course in sanitation" is the first of its kind that has been given to Reserve Officers It is, in a way, a departure from the basic principle that all Reserve Officers of the Medical Department should be trained in their purely military duties in the work of the Medical Department as a service rather than in specialized No attempt has been made or probably ever will be made to give a special course of field training for the surgeon, the internist, the ophthamologist, or for other specialists in the domain of medicine The medical service in a great war will be carried on to the extent of perhaps 95% by officers who, in civil life, belong to the medical, dental and veterinary professions The World War has demonstrated the necessity of auxiliary aid in order to round out the medical service both at home and in the theater of operations 1917 and 1918, these officers were commissioned in the sanitary corps which has been perpetuated as a section of the Officers Reserve Corps in order to provide the Medical Department, for a future emergency, with a highly trained specialized personnel to be found chiefly in the professions alhed and associated with medicine If called upon for active service in time of war, it is almost a certainty that most of these officers will function as specialists, and will not be employed otherwise in the general administration of the medical service of the Army Their services being specialized, the logical requirement is that they should receive enough training in time of peace to enable them to visualize the general field of military service in order that they may see more clearly the position they will occupy in the military establishment About 200, or 40%, of the officers now enrolled in the sanitary corps are engaged in professions and vocations closely allied to the general subjects of epidemiology and preventive medicine It was in recognition of this fact that the Surgeon General decided this year to provide training for this special group of Medical Department Reserve Officers

The summer camp training program at Carlisle Barracks now contemplates the division of Reserve Officers into three general groups and the establishment of a course in field training for each group, namely, a basic course for junior officers, a unit training course, and a course for hospital commanders and executives. The latter camp course will be held at Carlisle Barracks from September 9th to 21st, 1928. It seems probable that the special course in sanitation will also continue to be an established feature of the

training at Carlisle Barracks

THREE GENERATIONS OF DOCTORS

By A. L DARLING, MD, CORNING, NY

In the Journal under date of July 15, page 868, you ask if there are any doctors of the third generation of medical practitioners in the State of New York

I am one in that class

My grandfather, Dr Lewis Darling, was born in Woodstock, Vt, in 1804 He graduated in Medicine from Dartmouth College in 1830 removed to Tioga Co, Pa, and practiced medicine there all his life, and died in Lawrenceville. Pa ın 1882 He was a surgeon in the Civil War

My father, Dr Lewis Darling, Jr, was born in Lawrenceville, Pa, in 1840 He graduated in medicine from the University of Michigan, 1864 He practiced all his life in Tioga Co, Pa and died in 1916 He was a surgeon in the Civil War

My father had a brother, Dr Horace M Darling, born in Lawrenceville, Pa, in 1835 He graduated in Medicine at the University of Mich igan, 1858, was Surgeon-in-Chief on Pemberton's Staff in the Confederate Army during the Civil War After the war he practiced in New York State and died in Elmira, 1900

Dr Arland Lewis Darling, born in Lawrenceville, Pa, 1870, graduated from University of Buffalo in 1892, and located in Corning, N Y,

where I am practicing medicine My son, Carlos Mason Darling, born in 1899, was taking up the study of medicine He enlisted in the World War, was in the Medical Corps of the U S Army and died in Camp of influenza in 1918 With his death ended the fourth gen-

eration of practicing physicians Members of our family have practiced medicine and surgery for a total of more than 179 years, if the years that each have practiced were added together

SENECA COUNTY MEDICAL SOCIETY

The Semi-Annual Meeting of the Seneca County Medical Society was held at the Elk's Club, Seneca Falls, New York, on Thursday, May 10, 1928 Dr E W Bogardus in the chair

Dr T E Banford of Syracuse gave a practical and interesting address on "Certain Aspects of the Psycho-Neuroses with special attention to the common disease known as Hysteria"

The following officers were placed in nomina-

tion for the year 1929

For President, Dr W M Follette, Seneca Falls, N Y, Vice-President, Dr A J Frantz, Seneca Falls, N Y, Secretary and Treasurer, Dr Robert F Giggs, Seneca Falls, N Y
Delegate to State Society, Dr R M Elliott, Willard, N Y

Alternate to State Society, Dr R S Pettibone,

Willard, N Y

Delegate to 7th District Branch, Dr A Letellier, Seneca Falls, N Y

Alternate to 7th District Branch, Dr F W Lester, Seneca Falls, N Y

Censors, Doctors C B Bacon, L W Bellows

and F W Lester

I W Frost, Secretary

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on June 21, 1928, was called to order at 9 P $\,\mathrm{M}$, the President, Dr $\,\mathrm{Gitlow}$, in the Chair

It was moved and carried that, this being an Open Meeting, we dispense with the reading of the minutes of the last meetings of the So-

ciety and of the Comitia Minora

Election of Candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following physicians, Julius Fink, Adolph Foti, Samuel Nitsberg, Sarah Salant Rifkin, Louis J Sokol, Lazar Wallerstein

The President then presented Professor Harry Allen Overstreet, Head of the Department of Philosophy of The College of the City of New York, who spoke on "The Point of View of the New Psychology" At the conclusion of the address, Professor Overstreet answered the many questions of the members and friends

It was moved and carried that a vote of thanks be extended to Professor Overstreet for his excellent address

I J LANDSMAN, M D, Secretary

MEDICAL WARES

MINERAL OIL

Physicians are familiar with the medicinal uses of petroleum chiefly through its two products which are popularly known as vaseline and mineral oil Petroleum is a mixture of an innumerable number of different substances whose composition and characteristics grade insensibly one into another The fun damental processes of manufacturing petroleum products are fractional distillation and a reversal of the processes, tractional cooling Distillation separates the substances on the basis of their boiling point, while cooling is a more exact process depending on the melting or solidifying temperatures of the substances The further processes of purification consist of acidulation with strong acids, neutralization of the acids, and filtration to remove the undesir-An application of these able substances methods will enable a manufacturer to make products which have almost any desired specific gravity, consistency and viscosity, and are tasteless and odorless, even to the complete elimination of a suggestion of kerosene or other substance which is irritating or undesirable

The pharmacopeia recognizes two petroleum products,—a jelly called Petrolatum, or petroleum jelly, for external use, and a liquid called Petrolatum liquidum, for use as a cathartic or nose spray

Petrolatum is the substance which is commonly called vaseline, but this is a trade name whose origin is seldom recalled. The substances popularly called vaseline are variable in their pureness, consistency, odor, and taste, according to the use in their manufacture. A physician wishing to secure a pure product will prescribe Petrolatum, USP

Ichthyol is the trade name of a petrolatum having a peculiar fish-like odor. When it was first put on the market a generation ago, the statement was made that it was found in only a restricted locality in Austria, but in fact it is a petroleum product.

U S Pharmacopeia recognizes two forms of liquid Petrolatum,—the heavy and the light The heavy is used principally as a cathartic It was first placed on the market by the Belgians and Germans under the name of Russian oil Its use was advocated by the noted English surgeon, Sir William Arbuthnot Lane,

who wrote and lectured on its merits, and popularized its use. Its manufacture in the United States has been developed on an extensive scale since the World War, until now mineral oil in some form is probably the most widely used of all cathartics.

The standards of a cathartic mineral oil are those of liquid Petrolatum, USP The oil shall have a specific gravity between 0 828 and 0 905 at a temperature of 25 degrees centigrade. It shall have a specified degree of viscosity whose determination is technical matter, and it shall be free from odor and taste, The tests are intended to insure an oil of uniform composition which shall not contain even traces of kerosene, paraffine, or other substances, but shall be almost entirely inert and incapable of undergoing a chemical change or of producing a chemical change in another substance.

The effects of a good quality of liquid Petrolatum on the intestines are those of a lubricating oil. The theory is that it acts as a mechanical lubricant. It permeates the intestinal contents and makes them soft and slippery. At the same time it undergoes no chemical change and produces no irritation such as that caused by ricin, which is a constituent of castor oil.

Lither the heavy or the light liquid Petrolatum may be used as a cathartic. A heavy oil is likely to have a high viscosity, and so it may cling to the tongue when it is taken. On the other hand, an oil too light and lacking viscosity does not combine well with the intestinal contents, but it has the quality of penetrating unsealed containers even when they are snugly tied. It is therefore likely to seep past the sphincter of the bowel in an unpleasant leakage. A considerable latitude is possible among the oils of various manufactures, and an individual buyer may have a considerable choice in their superficial qualities

Liquid Petrolatum is also sold in combination with agar, sometimes under trade names. Only two or three per cent of agar is used and its value is largely that of emulsifying the oil. It also has psychological effect upon those persons who object to the taste of a pure mineral oil. Its physiological action is due only to the oil which is in it.

THREE GENERATIONS OF DOCTORS

By A L DARLING, MD, CORNING, N Y

In the Journal under date of July 15, page 868, you ask if there are any doctors of the third generation of medical practitioners in the State of New York

I am one in that class

My grandfather, Dr Lewis Darling, was born in Woodstock, Vt, in 1804 He graduated in Medicine from Dartmouth College in 1830 He removed to Tioga Co, Pa, and practiced medicine there all his life, and died in Lawrenceville, Pa in 1882 He was a surgeon in the Civil War

My father, Dr Lewis Darling, Jr, was born in Lawrenceville, Pa, in 1840 He graduated in medicine from the University of Michigan, 1864 He practiced all his life in Tioga Co, Pa and died in 1916 He was a surgeon in the Civil War

also

My father had a brother, Dr Horace M Darling, born in Lawrenceville, Pa, in 1835 He

graduated in Medicine at the University of Michigan, 1858, was Surgeon-in-Chief on Pemberton's Staff in the Confederate Army during the Civil War After the war he practiced in New York State and died in Elmira, 1900

Dr Arland Lewis Darling, born in Lawrenceville, Pa, 1870, graduated from University of Buffalo in 1892, and located in Corning, N Y,

where I am practicing medicine

My son, Carlos Mason Darling, born in 1899, was taking up the study of medicine. He enlisted in the World War, was in the Medical Corps of the U.S. Army and died in Camp of influenza in 1918. With his death ended the fourth generation of practicing physicians.

Members of our family have practiced medicine and surgery for a total of more than 179 years, if the years that each have practiced were

added together

SENECA COUNTY MEDICAL SOCIETY

The Semi-Annual Meeting of the Seneca County Medical Society was held at the Elk's Club, Seneca Falls, New York, on Thursday, May 10, 1928 Dr E W Bogardus in the chair

Dr T E Banford of Syracuse gave a practical and interesting address on "Certain Aspects of the Psycho-Neuroses with special attention to the common disease known as Hysteria"

The following officers were placed in nomina-

tion for the year 1929

For President, Dr W M Follette, Seneca Falls, N Y, Vice-President, Dr A J Frantz, Seneca Falls, N Y, Secretary and Treasurer,

Dr Robert F Giggs, Seneca Falls, N Y
Delegate to State Society, Dr R M Elliott,
Willard, N Y

Alternate to State Society, Dr R S Pettibone,

Willard, N Y

Delegate to 7th District Branch, Dr A Letel-

her, Seneca Falls, N Y

Alternate to 7th District Branch, Dr F W

Lester, Seneca Falls, N Y

Censors, Doctors C B Bacon, L W Bellows and F W Lester

J W Frost, Secretary

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on June 21, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the Chair

It was moved and carried that, this being an Open Meeting, we dispense with the reading of the minutes of the last meetings of the So-

ciety and of the Comitia Minora

Election of Candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following physicians, Julius Fink, Adolph Foti, Samuel Nitsberg, Sarah Salant Rifkin, Louis J Sokol, Lazar Wallerstein

The President then presented Professor Harry Allen Overstreet, Head of the Department of Philosophy of The College of the City of New York, who spoke on "The Point of View of the New Psychology" At the conclusion of the address, Professor Overstreet answered the many questions of the members and friends

It was moved and carried that a vote of thanks be extended to Professor Overstreet for his excellent address

I J LANDSMAN, M D, Secretary

suppression of ancient jokes and persistent jokers and the ponderous witticisms of certain persons now comfortably seated on pedestals of humor would gradually die out

"One important point must not be overlooked if this comedy course is put on For every class and every student there must be a corresponding class and student to learn the art of listening pleasantly. There is no sense in graduating a lot of humorists of they are not provided with a dutiful audience."

The editorial has a special appeal just now in the season when the District Branch meetings of the State Society are about to be held. A large

proportion of the speakers who discuss papers and make after dinner speeches will spend half their time saying that they do not see why the presiding officer should invite them to expose their ignorance, and the other half of the speeches will consist of a story taken from Tonics and Sedatives of the A M A Journal Last year the same story was used by three different speakers at three The story has faded from District meetings memory, fortunately, but it will doubtless seem new when it turns up again this fall at some Dis-After all the old joke is the best, trict Branch and there is justification in telling it if it seems new to only one person in the audience

BRAIN DEVELOPMENT

The New York Times of August 5 contains a popular description of three books on the brain planned by Dr Frederick Tilney, Professor of Neurology at Columbia University Concerning the relation of the hands to the development of the brain, Dr Tilney is quoted as saying

"A certain group were forced to climb the trees and to live in hiding among their leafy branches And then what happened? Their paws were turned into claw-like hands. A very important thing. They were now ready to discover the real treasures of the brain, which, as we have seen, was not of great avail until this new key was found to unlock it. Claws in the end became hands, and hands were these very keys that unlocked the brain.

"Other animals sought protection in swimming, flying, running Simians found it in swinging themselves from branch to branch in their arboreal retreats With increasing weight some

of them came down nearer to the ground They assumed an upright position. Then their hands were freed! They turned them to new and constructive purposes

"Soon we find that the hands were the instigators of human speech. A gesture was a symbol, but gestures were inconvenient when hands were needed for other usages. Sounds were used to take their place, that hands might be left free. With the acquisition of speech the human type was well on its way toward the far distant goals of humanity

"Is there still a possibility of further evolving in the development process so clearly seen in the brain of primates, so obviously reaching its present culmination in the brain of man—is there still a latent power in the human brain for the expression of yet unsuspected potentialities and beneficial progress?"

SCIENTIFIC LAW TEACHING

The New York Herald-Tribune of July 22nd has an editorial comment on the announcement of the Johns Hopkins University that it has established an Institute for the Study of Law, which seems to function after the manner of teaching medicine in the best schools. Law is a science, but its practice is too often a political art. While the secrecy of the sick room veils the methods of doctors and covers up their unscientific methods,

the publicity of the court room exposes the tricks of the lawyer. However, making allowance for this, a doctor has good ground for thinking that he practices the science of his profession better than the lawyer practices his. A lawyer will necessarily be hampered by the written law whose meaning can be twisted by an opponent, but he will raise the standard of his profession if he introduces more science into his practice.

THE DAILY PRESS

ORIGIN AND DISAPPEARANCE OF DISEASES

A suggestion regarding the origin of new diseases is contained in the New York Herald Tribune of August 6, made by Dr Bernard O Dodge, plant pathologist at the New York Botanical Garden, Bronx Park the article says

"Dr Dodge has produced a fertile hybrid from two species of the same genus of red mold fungi This achievement, it is said, has an important bearing on the study of plant diseases, which are

causing heavy losses to agriculture.

"If the two molds with which he has worked can produce other types differing from them and able to produce offspring like themselves, it may be deduced that other fungi may do the same thing, particularly in crosses between varieties

"This experiment, Dr Dodge says, throws new light on the problem of plant disease, but also complicates it. For example, wheat rust is a fungus which strips the plant to the stalk. Government pathologists have recently produced rust-resistant strains of wheat which have flourished fairly well although exposed to the particular rust which has been studied. But if fungus species can propagate and produce fertile hybrids differing from the parent organisms, Dr. Dodge says this means that new worms may be arising constantly against which the rust-resistant wheat may not be effective

"Although the problems facing plant pathologists may be increased, he declares, his experiment will be of ultimate assistance as it offers an explanation for the existence of many new varieties of fungi whose origin would otherwise

be mexplicable"

While new diseases probably arise, old ones may disappear when conditions become unfavorable for their spread. The New York Times of August 5 contains an article on the plans of an African Expedition sent under the auspices of the University of Wisconsin, the Guggenheim Memorial Foundation, and Parke Davis Co, for the purpose of studying sleeping sickness and developing methods of treating it with arsenical compounds. The article quotes Dr. Thomas, one of the research workers

"In other days many of the imported negro slaves in the Southern States died of South African sleeping sickness. Fortunately no interme diary host such as the tsetse fly was present in the South to spread the infection. In former times this fly has lived in the Americas, and fossils of some twenty-odd species have been found in the Colorado shales. Since the evolution of the horse can be most satisfactorily traced in the West, and since there were no horses in America at the time of Columbus, it seems quite possible that the vast herds of horses were wiped out by a trypanosomate disease carried by the tsetse fly"

Here is probably an example of a disease disappearing after all its available victims had been eliminated. But no one can give a probable reason for the disappearance of the tsetse fly at the same time. The situation is similar to that of the fungus that caused the death of the native chestnut trees of the Eastern States. When all the chestnut trees have died, the fungus which caused the destruction may die too and chestnut trees may grow again if new stock is introduced.

COURSES IN HUMOR

A somewhat varied experience in attending medical society meetings has led the editor to take particular notice of an editorial in the New York Times of August 6, on the report current in England that a chair of humor would be established in one of the American Universities The Editorial says

"How the 'Professor of Jocularity' would go about instructing his pupils it is difficult to imagine. The general subject would have to be divided up into classes for the needs of different people. Some are naturally gifted—or cursed—with the ability to make puns. The class in anec-

dotes, which, it may as well be confessed to London, would certainly be most heavily patronized, would necessarily go in for research. For students of comic exaggeration the professor chosen would not have to be a natural comedian himself. In fact, almost any undergraduate could take the chair and give practical demonstrations by the hour.

"A department for discouraging would-be and unqualified humorists should go hand in hand with the jesters' section. The graduates in such a course as that could do a great deal of good in the world. They would form a society for the

TRAINING COUNTY HEALTH OFFICERS

The Virginia Medical Monthly for July contains an article on the Field Training of County Health Personnel, by Dr Charles N Leach, of the Rockefeller Foundation This article is full of information and suggestions, as will be seen from the following extracts

"The Alabama legislative body has recently increased its appropriation for health work to such an extent that it is now planned to establish a full-time health department in every county in the state regardless of population or economic status. To meet the requirements for trained personnel in connection with this program of expansion, the state health officer is now organizing a training station as a function of one of his county departments, the county health officer to act as director of the station

"Slight emphasis is placed on the teaching of preventive medicine in the majority of our medical schools in the United States, and the recent graduate knows little of the practical application of the subject Vanderbilt University Medical School offers one of the notable exceptions

"We cannot look to the schools of public health for our county health officers These postgraduate institutions are turning out men, as a rule, who are highly specialized in one branch of the subject and consequently are in demand for administrative positions in state health departments, research institutions and as teachers is quite evident that any physician qualified for practice is not necessarily capable of serving as a county health officer, giving only a part of his It is desirable that this time to official duties medical training should be supplemented by theoretical and practical instruction in public health work

"Five years ago the International Health Board established a training station in Covington County, Alabama, which served as a place of appraisal of prospective regular staff members to ascertain their qualifications for home and for-Twenty-nine regular Rockefeller eign service Foundation staff members have passed through this preliminary training The value of this system of appraisal and intensive field training soon became apparent to several state health officers and at their request their newly appointed men were offered the facilities of the station. It has been the aim of those responsible for the development of the training station to emphasize practical field instruction and to stimulate an interest in rural health work Close association with those in training has also given an opportunity to judge of their ability and actual interest in the work

"For the successful accomplishment of the training program an elaborate organization is un necessary. A well-organized county health unit, with a competent staff, offering a diversity of public health problems fulfills the requirements for intensive field training. A state with fifteen or twenty units in operation and a prospect of organizing new units could well afford to maintain such a station. The expense of operation would add little to the normal budget of a county health unit. The returns in the way of increased efficiency and tenure of office would more than justify the small additional expense.

"During the past five years 283 physicians have enrolled at the three training stations Of those training at the Alabama station 136 per cent have failed to receive the approval of the director At the Mississippi station 128 per cent were not recommended for service in the field of public The elimination of this group of failures has resulted in a financial saving to the official health agencies and perhaps the salvation of some A disinterested incompeof their county units tent health officer can very easily bring about dissatisfaction which might result in discontinuing the work The most common factors giving rise to unfavorable reports on these men were lack of tact and interest If I were asked to specify the most important qualities essential to the success of a county health officer I would unhesitatingly say tact, common sense and judgment

"The period of training has varied from two weeks to four months In some few instances it has been impossible for the candidate to spend more than two or three weeks in training and in those cases an appraisal of the man was all that could be hoped for It is desirable where possible to give the man two and one-half months to During this period three months at the station no didactic work is attempted, the time being devoted to actual participation in the work of a Conferences are conducted by the county unit directors of the various bureaus of the central administration and occasionally a visiting health official is asked to address those in fraining Demonstrations are given in the methods of record keeping, graphic representation of results, sanitary surveys and the actual operation of each bureau of a state health department A few days are spent in the field with the health nurse and sanitary inspector This gives the candidate some

(Continued on page 1019, adv xiii)

(Continued from page 1016)

idea of the interrelation of the work of the personnel of a health unit

"As a result of the increased demand for training it was found necessary, about a year ago to establish a second station Darke County, Ohio, was selected as a favorable site and by a cooperative agreement between the local board of health, the State Department of Health and the Rockefeller Foundation the facilities of the Darke County Health Department have been made available for training or for observation Ohio station offers practical training in connection with county health administration and organization, budgets and budget making, the keeping of records, preparation of reports, the handling of communicable disease, graphs and graph making, epidemiological procedure, making sanitary surveys, field map making, health laws, the control of nuisances, inspection of dairies, the inspection of food handling establishments, inspection of schools, the examination of school children and all the detailed field work and record keeping of public health nursing

"From the time the Station in Mississippi was established—July 8, 1927—to the middle of December, 173 physicians, nurses and sanitary inspectors enrolled at the station. They averaged a training period of 315 days each They came from all sections of the United States and in a few instances from Canada

The total number of physicians, nurses and sanitary inspectors reporting for training to the three stations during the past five years has been 448—283 physicians, 80 nurses and 75 sanitary inspectors In addition to this number ten Harvard medical students have been given an intensive field training, receiving credit towards graduation for the work completed at the stations,

"An attempt was made to grade a group of sixty-nine persons who received training, dividing them into groups of 'good,' 'fair' and 'poor' The failures were included in the last group was found that 348 per cent could be included in the 'good' group, 449 per cent as 'fair,' and 203 as 'poor'

"While we realize that the training offered has been unsatisfactory in many respects, it is felt that it is a step in the right direction and that the time will soon come when an adequate foundation in preventive medicine will be offered by our medical schools"

Ultra-Violet Combined With Heat and Light Make Possible a Wide Range of Therapeutic Uses

CLINICAL evidence and the experience of well-known authorities has shown that the new Battle Creek Super Solar Arc Lamp may be successfully used to treat a wide range of the most stubborn and deepseated disorders

Not only does this AD-VANCED-TYPE LAMP possess many improved mechanical features of construction, such as the automatic magnetic feed which prevents loss of time in waiting for the rays to attain adequate intensity, but the superiority of this lamp in the treatment of general constitutional conditions, as well as local surface conditions, is largely due to the combination of rays produced

An ample amount of ultraviolet radiation plus the radiation infra-red, results in the production of a spectrum that most closely approaches that of the sun Since the Super Solar Arccombines ultra-violet and infra-red rays it finds dozens of uses, for rachitic patients, for skin diseases, for relief of congestion, and other conditions The technic of handling this lamp is easily and quickly mastered

Our new bulletin describes fully the many mechanical and therapeutic advantages of the Super Solar Arc May we send you a copy?

mittee of the Illinois State Medical Society The scope of the work is shown by the following abstracts

"The Educational Committee of the Illinois State Medical Society functions as a medium between the medical profession of the state and the laity as individuals and groups"

"A lay organization which for several years has asked the assistance of physicians for making examinations of more or less large groups of girls, has now decided that it is neither fair to the individual doctors nor to the individual girls and their families to ask that these examinations be given free of charge, except where such procedure is warranted"

"During the past year there has been a friendly feeling existing between the Illimois State Medical Society and other organizations, such as the Illinois State Dental Society, the Illinois Federation of Women's Clubs, the Parent-Teacher Associations, and the State De partment of Health through the Child Hygiene Division

"The Educational Committee was asked to revise certain literature which is used by the Child Hygiene Division. The members of the Committee have been consulted in medical problems which have come up and a very satisfactory understanding exists."

"A service made possible by the splendid cooperation of physicians of Illinois is that of the Speakers' Bureau This department of the educational program makes it possible for all kinds of lay groups to be assured of first class speakers on health subjects Women' clubs, men's clubs, churches, industrial corporations, Parent-Teacher associations, schools, colleges, have had programs arranged through the Educational Office It is impossible to say just how many persons have been reached during the last twelve months in the 640 meetings covered, but it is a safe estimate that 175,000 have heard at least one definite statement regarding the value of good health"

"A request came from the personnel director of a factory employing a large number of women and girls. About 300 girls came to this meeting which was held at five o'clock, after the offices were closed, and so successfully did the physician present his subject of personal hygiene that the girls have requested other lectures in the fall."

"Last fall an attempt was made to have a health talk given at every county teachers' institute. The response was very good and thousands of teachers heard these lectures which were given by physicians. An endeavor was

Diet in the treatment of Diabetes... let us send you this booklet - and valuable recipes

W AYS of improving the diabetic diet are always important. There are two ways to improve it—make it more appetizing—make it more effective. Monotony in the diabetic diet is its chief enemy!

Here's where Knox Sparkling Gelatine plays an important part. Made plain and pure—having no flavoring, coloring or sugar content—it is an ideal food for the purpose. It combines so deliciously with the fruits, vegetables, chicken and other foods you prescribe for diabetes—it makes them taste different—it prevents monotony from defeating the patients appetite. And furthermore, Knox Gelatine with its colloidal ability, makes the foods with which it is combined easier to digest—it adds health to the diabetic menu.

Knox Gelat ne is a pure protein yielding four calories per gram

We have literature and recipes, prepared by eminent dieticians, especially for the diabetic diet. May we send these to you? They are being used by many physicians with gratifying success

(Continued from page 1021—adv xv) talks were given, copies of which are on file in the office of the Committee

"Posters have been collected from many agencies in the United States and have been mounted attractively to appeal especially to school children The following was noted in a newspaper clipping received shortly after the posters were exhibited in an Illinois city 'These posters were placed in all the upstairs class rooms and in the assembly of the high The high school students examined them These posters illustrated some very necessary things, such as sleep with windows open, drink pure water and milk, eat green vegetables and fresh fruits, keep a good posture, and take care of your feet One poster gave the pictures of some very noted medical These posters furnished theme work for all of the English classes'

"Sixty-five Health films were ordered by the Committee from the State Department of Health, the University of Wisconsin, and other sources for schools and clubs. The Committee does not assume any responsibility for posters, films and general health educational material secured from any source aside from the Illinois State Medical Society

"Assistance has been given whenever possible to the Woman's Auxiliary of the Illinois State Medical Society With the completion of this organization in every county, there will be many more calls made upon the Committee for speakers and general educational material The physician's wives will no doubt make sure that when health speakers are to appear on their club programs these will be secured through the Speakers' Bureau of the The Auxiliary can Educational Committee be of great assistance in securing the interest and co-operation of club women in health ac-The Educational Committee is in a position to assist in the carrying out of these activities as far as is consistent with its policies and those of the State Society"

"Every county in the state of Illinois has been given one service by the Educational Committee Some counties have made considerable use of the activities mentioned above, while others have shown less interest. The office of the Committee will gladly assist any county whenever possible."

CONTRACT PRACTICE

The July issue of the Virginia Medical Monthly carries the following news note

"The following proposed draft on 'Contract Practice' has been prepared by the Board of Trustees of the Richmond Academy of Medicine and will be presented to the general membership at its next meeting on the second Tuesday in September We take the liberty of publishing it, as it may prove of interest to other societies

"The traditional attitude of the medical profession is opposed to contract practice except when some substantial advantage to the people served by the contract arises out of it, and when this advantage is not one of reduced fees for people able to pay standard fees

"The advantages usually to be recognized as legitimate are

- (a) Prevention of disease or accident
- (b) Increased efficiency in treatment through the more ready availability of the practitioner, or his special knowledge of disease or accident likely to arise, or his familiarity with facilities provided for treatment
- (c) Protection of a party or corporation from liability to unjust claims or suits

"A practitioner who accepts a contract should be prepared to show that it accords with accepted standards of ethics, and further that legitimate advantages of the contract are not used to cloak unethical extensions of its provisions

"Except in isolated communities where it is necessary to make unusual arrangements, the family unit is not a proper object of contract

"A contract should not provide compensation below the prevailing standard of fees

"The group or party with which a practitioner enters into a contract should have some social or economic purpose re-

sulting in a unity of living or working condition and the object of the organization should be obviously above a suspicion that medical services at reduced rates is any part of that object or purpose

"A contract tends to be relieved of suspicion of unworthy purposes in proportion as the services rendered are limited to premises where employees work, and the hospital or infirmary quarters routinely maintained to meet the needs covered by the contract"

DIATHERMIA IN SURGI-CAL SHOCK

Dr W L Cahall of Palestina, Texas, in an article on physiotherapy in the July issue of the Texas State Journal, says concerning diathermia

"Possibly the most spectacular results that have come under my observation have been in shock, the nightmare of the surgeon There are two methods of handling this condition, the first and simplest is to apply infrared radiation to the extremities, and by this means, readjusting the circulatory equilibrium as well as stimulating general metabolism The lamp should be from 20 to 30 inches distant to the treated part and the time of treatment from 30 to 60 min-The alternative method is the employment of diathermia. preferably using Crile's technic of an anterior and posterior plate over the liver, when feasible, otherwise, a plate behind the liver and a cuff around one ankle would be the hook-up of choice. The current should be sedative and its strength should be around 2,000 milliamperes duration of the treatment should be 45 minutes I have seen apparently moribund patients brighten up, and before the termination of the treatment, engage in general conversation with the attendants about the room "

Two Syringes of Multiple Uses

ASPIRATION SYRINGE illustrated THE PFARRE TRANSFUSION AND

at the top comprises all of the simplest principles set forth in a syringe of its type A half turn of the syringe alternately opens and closes the inlet and outlet tubes, the friction valve (no

balls) prevents leakage or back flow Send for reprint Price \$12.00

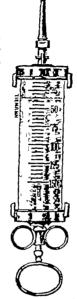

THE ALEXANDER RECORD BLADDER SYRINGE can be used for filling the bladder and is also adaptable to washing ears or irrigating wounds Has de tachable ends to facilitate cleaning and is supplied in three sizes 75 cc. at \$750 100 c.c. at \$900 and 150 cc. at \$1050

PRESENT STATUS OF THE PRACTICE OF MEDICINE* By LINSLY R WILLIAMS, M D, NEW YORK, N Y

THERE is no necessity of any statistical study to furnish evidence that there have been numerous changes in the practice of medicine during the past twenty-five years. The object of this paper is to estimate, to a certain extent, the causes which have produced these changes and the new conditions which have arisen as a result and, further, to indicate insofar as may be practicable other changes that will undoubtedly come within the next decade or two

The most striking difference between the practice of medicine today and the practice of medicine two or three decades ago is the enormous increase in the amount of medical knowledge which may be applied for the diagnosis and treatment of diseased conditions and further to detect minor abnormalities in the human body

General medical practice of thirty or forty years ago was carried on in an office which had for its equipment a medicine cabinet, a sofa or an examining table and a table which could be used as a laboratory. The technical equipment consisted of a thermometer, a stethoscope, a prescription pad and a sufficient amount of chemicals to determine the presence of albumin and sugar in the urine. A few advanced practitioners had a microscope and at the close of the century a few more were able to examine a specimen of blood to determine the leucocyte count and the presence of malarial parasites

The medical practitioner of today must have a far larger armamentarium than this and its complement is so familiar that it is unnecessary to mention it further than to recall that medicine cannot be practiced today without the assistance of a nurse at times, without well equipped offices and without making use of special technical methods of diagnosis, primarily in the clinical and x-ray laboratories

SPECIALISM IN MEDICINE

Fifty years ago specialism in medicine was in its infancy and it is significant to note in any medical school prospectus of that period, that although courses were given in the medical schools in special subjects, in the main these special courses were given by general practitioners

In one of our most prominent schools in New York State at that time physiology was taught by a young surgeon, anatomy by a surgeon and obstetrics by a general practitioner, which included gynecology Diseases of the skin were taught by a general practitioner as also were children's diseases, operative surgery, minor surgery, physical examination of the eye, otology, laryngoscopy and rhinoscopy were all special optional courses for which extra fees were charged

A few general practitioners and a few surgeons had developed a special interest and displayed an unusual aptitude in certain fields but they were in no sense specialists as we now understand the term. It was the rule for every physician to be a general practitioner first and to become a surgeon later, and not so uncommon for the surgeon or the general practitioner to devote a part of his time to some specialty.

About twenty-five years later it was not unusual for a physician to take up a specialty immediately after graduation. After special work in a particular field this physician became well qualified in a definite branch of medicine, but had to rely on the opinion of his colleagues in other fields on many occasions

At the present time, however, it is quite common for physicians to go into a specialty immediately after graduation and before there has been any opportunity to acquire experience in general practice. Weiskotten has made a survey of 1379 graduates of 1915 and found that in 1924 only 22% of them were engaged in general practice, that 678 of the graduates of that year expected to be specialists and that

PROTEIN MILK

Merrell-Soule Powdered Milk Products are packed to keep indefinitely and trade packages carry no expiration date

and sufficient time to enable him to equip himself and means to equip his office in a satisfactory manner and to employ assistants is in the position analagous to the large farmer While the individual who has not been able to continue his post graduate studies and is forced to gain a living from the outset of his career soon finds himself in a rut unable to satisfactorily equip his office, with insufficient means to employ assistants, sees with jealous eyes his successful colleagues driving around in their high powered automobiles, and he naturally feels the economic pressure and also cries for relief

During the past twenty-five years there has been a most astonishing change in the manner of living in this country, luxuries have become necessities and as each new luxury becomes a necessity the cost of this necessity becomes a tax on all the people by an increase in the cost of living. The high cost of living is due to

the cost of high living

This increase in cost and in standard has influenced our habits of eating, dressing and general living, causing a larger expenditure than necessary. Naturally the physician, to keep up with the Joneses, has been affected and his desire to advance his economic level is only to be expected. He has learned of the earnings made by lawyers, engineers and chemists, to say nothing of the earnings of men busy in the financial and industrial world.

Should not the physician keep up too? Efficiency costs him a pretty penny and although costs of maintenance may be charged off on the income tax yet the money must be spent to keep a proper office and play the role of the modern practitioner

It is not surprising then to find that a considerable number of our profession become activated with the acquisitive instinct and charge not only all the traffic can bear, but a good deal more A few authentic and fully substantiated cases will suffice

THE INDIVIDUAL AND THE COMMUNITY SPIRIT

From the earliest history of medical education it has been the practice to train the physician as an individual His work in the medical school and as a hospital interne, or at work in a dispensary is essentially individualistic When the physician begins to practice, the relations between him and his patient are essentially individualistic and secret and it is only natural that his outlook on life should very generally be that of an individualist has an ample opportunity to study human nature and frequently is one of the wisest of men in this important field of human knowl-He has also been schooled in the idea that medicine is a dignified and noble profession and that it is far removed from business and that business principles are not applied to the practice of medicine

Fifty years ago the great majority of our college students were being prepared for the law, medicine or theology. It was a matter of common knowledge that the doctor, lawyer or minister in the community, were the only educated members thereof and they were looked up to as the chief advisers in all cultural and political matters, and truly enough, their knowledge was above that of their fellows

After the opening of the Fall term of our universities and colleges in 1927 it was found that there were 437,000 students enrolled, which means that over 100,000 students are graduating from our colleges and universities annually, 5,000 of whom graduate in medicine. In other words, there are twenty times as many graduates from colleges and universities annually as there are physicians, and the physician is not alone in his glory any more as the arbiter of all things and as eminent relatively in the community as he was fifty years ago

The physician whose capital is backed with brains and the capacity for work, plans his method of ladder climbing while in the medical school. He seeks an internship of at least two years' duration and continues his work in dispensary, laboratory or teaching positions, and by the time he is thirty-five he has an excellent reputation, a hospital position and little practice, but he is well up the ladder and patients, positions and honors come to him rapidly and the last half of his climb to fame is often but a sudden leap

Those graduates who cannot afford this slow process or those whose brains are not farsighted enough immediately enter practice and in five or ten years may have a large practice, 741 of the 1920 graduates expected to limit themselves to a specialty

In addition to the practice of specialties, there are an increasing number of physicians who are being employed on full-time salaried positions and Weiskotten noted that many of the graduates of the schools selected in 1915 and 1920, amounting to 2,905 graduates, 18% were employed on a salary basis and 2% more on part-time salaries

One sometimes gains the impression in some of our larger cities that in the wealthier section of society the general practitioner no longer exists and the sentiment has been expressed on more than one occasion that there are fifty-seven different varieties of specialists to diagnose and treat fifty-seven different varieties of diseases and lesions but no physician

to take care of the patient

This is in marked contra-distinction to the situation which exists in Britain and Watson² has stated that in the city of Edinburgh with a population of 500,000 and an additional half million people within a fifty mile radius there is only one pediatrician, six physicians who confine their practice to ear, nose and throat, and three to dermatology, one to venereal disease, six to ophthalmology and eight or ten more to obstetrics and gynecology—about thirty specialists among four hundred physicians

One must not overlook the fact, however, that many a physician may become a very skilled specialist while the time and mental energy required to keep up with new information in regard to a large number of diseased conditions is somewhat beyond him. The value of these competent specialists is that it is possible for them to diagnose and treat many conditions successfully which are beyond the ken of the average practitioner and it is believed that the standard of practice has been very largely improved as a result of specialization

This specialization or really over-specialization also has its defects. The specialist occasionally overlooks an underlying general condition due to his lack of knowledge of diseased conditions affecting parts of the body outside of his specialty. This may produce results

which are disastrous for the patient

The patient also complains of the fact that he must go to four or five different specialists at considerable expense not only in money but in time

On the other hand, the general practitioner complains because his patient does not consult him for trivial or grave disorders when a special part of his anatomy is affected, but goes directly to the specialist. It is not uncommon to find a patient who has visited during the year the ophthalmologist, the otologist, the laryngologist, the urologist, the gynecologist,

the dermatologist and even other specialists without having once consulted the family

physician,

Further, there are many minor conditions that can be readily diagnosed and treated by the general practitioner who is ready and will ing to do so for his own modest fee, but the patient goes directly to the specialist and is perhaps diagnosed and treated no more skillfully but pays a fee perhaps five times as large.

When the necessity arises for consultation or for operation, the family physician is frequently on the scene first but when the patient is referred to the specialist the private practitioner only too often fades out of the picture

The specialist has proven that on account of his special and limited knowledge he can command higher prices, can earn a larger amount of money than the general practitioner but very commonly his services are of no more value than are those of the general practitioner and his knowledge less broad and the general practitioner naturally becomes, consciously or subconsciously jealous of his more successful colleague and in order to maintain his standard of living, he is tempted to find some method of making immoral and unethical practices both moral and ethical

Over-specialization, no doubt, fias played the largest part in the development of the serious evil of the division of fees. Medical societies have voted that the division or splitting of a fee is unethical and it is because the patient is being surreptitiously charged for services not billed for and apparently not rendered

HIGH COST OF LIVING AND COMMERCIALISM

There is a certain analogy between the situation of the farmer and the general practi-For generations, both the farmer and the practitioner were either contented with or forced to accept long hours of work with little recompense beyond earning a sufficient amount to support the family with little if anything left over for savings. It would seem as if both groups had been affected by the apparent ease with which many thousands of people have become wealthy and the farmers now feel that it is essential that they should not only earn a living from their work but also become rich The large farmer with his thousands of acres, his modern machinery and efficient methods of operation and adequate capital to enable him to sell at the proper period of the year, is able to acquire considerable wealth small farmer with a few score acres is unable to purchase modern machinery or goes into debt for more machinery than his acres permit and soon finds himself saddled with debt and forced to sell upon any terms and naturally cries for farm relief

The physician who has capital behind him

sue and had to prove negligence on the part of the employers who frequently suffered far larger financial loss than they now do by distributing the loan and by insuring themselves nesses due to industry

The ideas underlying the Workmen's Compensation Acts also stimulated the organization of Labor Departments with legislation requiring the installation of protective devices and the inauguration of preventive measures which have diminished to a considerable extent the number of accidents, injuries and illnesses due to industry

There are several features in our laws which are not wholly satisfactory, primarily because the employer insures with a company to protect him against loss and the insurance companies or carrier is able to furnish medical care and compel the employee to accept treatment from the insurance company's physician

The operation of the Workmen's Compensation Laws and the Labor laws has performed a most useful purpose in diminishing bodily injury, ill health and financial loss. They have also been of influence in teaching employers of labor that wholesale methods of medical care reduce the total medical costs and have played their part in an attempt to reduce the economic cost of disease.

INDUSTRIAL MEDICINE

Large employers of labor have learned during the last generation that a rapid labor turnover is expensive and as a result of inquiries have found frequently that employees accepted without discrimination as to physique add to the labor turnover It was not long before industries began to employ physicians to establish a medical service which varies from a first aid service in the factory to a more complete system of physical examinations of each new applicant for employment made by the company's physicians, rarely to reject but to classify applicants for particular types of work In some instances, industry sends applicants with physical defects to a hospital for treatment and subsequent employment

In case of accidental injuries or illness, industrial medical departments make complete special examinations, provide for treatment at the company's expense, organize meetings for discussing "Safety First in Factories," and supervise methods of work in order to reduce the amount of illness and accident

The maintenance of measures of this type has reduced the insurance rates against accident, reduced the labor turnover and has saved a large amount of money for the industries concerned. Further, it has reduced the amount of time lost to the industry, but what is more important from a social point of view has rela-

tively increased the individual earnings of the workers

Physicians should appreciate that industry recognizes the value of what might be termed wholesale medical service and that this service is rapidly expanding. In the report of the National Industrial Conference Board for 1926, some figures are given which show the enormous extent of this service. Of 499 industrial establishments reporting, employing 1,116,000 employees there were 265 full-time physicians, 355 part-time, 769 physicians on call, 13 full-time dentists and 78 part-time dentists, 845 nurses, 254 technical assistants, and 360 clerks

Four hundred and sixty-one establishments reported on the work done, that among 995,000 employees, 1,596,000 injuries were treated, 3,380,000 dressings were done, 1,789,000 medical cases treated, and 631,000 physical examinations were made. The cost of this service is quite remarkable. Ninety-nine establishments employing 495,000 persons pay an average of \$2 50 per employee per annum. These costs vary from \$1 84 per capita per annum in the tobacco industry, to \$24 40 per capita per annum in one of the mining industries.

The report further states that there are something over 9,000,000 employees in these various industries reporting to the National Industrial Conference Board

Medical societies have objected to industrial medicine because the employee has no freedom of choice in regard to the company's physicians, but the employee can select his own physician for care not given by the company Here again, the total amount of disease and injury is diminished and a larger amount of work is performed by full-time physicians than would be possible by physicians engaged in ordinary practice, and the economic cost of disease is diminished

HEALTH DEPARTMENTS

The functions of the health departments originally dealt primarily with individuals whose physical condition might affect the health of others This primary function is well understood insofar as it applies to quarantine and isolation Compulsory vaccination against smallpox has been generally accepted by organized medicine and it is very commonly given free for those who cannot pay and on some occasions given compulsorily to everyone within sight whether he can afford to pay or not A more recent procedure, the administration of toxin-anti-toxin to protect the individual, has been administered by some health departments free, which has received the opposition of the medical profession

In more recent years, the functions of health departments have largely expanded in efforts which protect the individual against condi-

yielding a satisfactory income which comes from limited fees

The former finds himself secure economically and professionally and the latter, though with limited income, is respected by his friends and patients even though he has no hospital,

laboratory or teaching position

It is found that many in this latter group of physicians worry a great deal about their position, they feel the economic pressure, or they fear it and many of them violate the tenth commandment daily. It is largely in this group that are found those who oppose health department activities, lay health organizations, demonstrations, Life Extension Institutes, Pay and Free Clinics, and those who want the open hospital—while the first group, economically secure, take but little interest in these questions. It is believed that the basis of the opposition is threefold

- 1 Loss of income
- 2 Loss of prestige
- 3 Fear of State medicine

It has been sufficiently demonstrated that increased medical knowledge, specialization and commercialism have largely increased the cost of medical care. Nearly all of the newer activities in the hospital, dispensary and health fields have been inspired by a desire either to reduce the cost of medical care or to extend adequate medical service, either preventive or curative, to a larger number of the population than ordinarily receive it

HOSPITALS AND DISPENSARIES

A brief reference to some of the procedures undertaken will be of value in appreciating what has taken place in the last twenty-five In the first place, there has been a marked increase of institutional practice Davis⁸ has recently published figures showing the enormous increase of hospital practice 1873 there were 149 hospitals and allied institutions in the United States and in 1924 there were 6.762 In 1873 there were but 35,000 available beds while in 1924 there were 770,000 The increase in out-patient service has been even larger In 1900 there were only 150 clinics in the United States while in 1925 there were over 5000 Davis further estimates that about 17% of the total working time of physicians is engaged in hospital and institutional work, not including laboratory workers or hos-The hospital and out-patient pital internes departments are supported either by government or private agencies but in most instances the suggestion for the organization of a hospital or out-patient department or clinic has come from the physician The physician finds it greatly to his advantage to belong to a hospital because it makes it possible for him to

see a larger number of patients in a smaller amount of time, it furnishes him with an opportunity of adding daily to his medical knowledge and gives him an additional prestige among his colleagues

The well organized hospital and out-patient department have at their disposal various specialists which make it possible to conserve the time of a patient which is particularly important for those individuals who lose their pay while absent from work. It may be truly said that both the hospital and out-patient department when properly organized save time for both physician and patient and are indirectly efforts on the part of society to diminish the cost of medical care.

There is uniform agreement that a hospital service is of the greatest value to the physician The physician who devotes time and interest to his hospital service daily, increases his mental capital and the experience thus gained is of the greatest value to him in private practice When once such an opportunity has been obtained by a physician, he rarely relinquishes it until he is required to by a regulation which specifies the age at which the medical staff should retire or on account of his own physical incapacity or because he has obtained another appointment which he believes to be of more Physicians recognize the importance of hospital work and it is strange that occasion ally hospital physicians tell their patients of the amount of time and service that they devote in caring for the poor in hospitals and dispensaries and that for this reason they must charge more for their services seems to be somewhat outside the mark public has no quarrel with the physician for making a charge even though it seems very high provided the patient understands in advance what the charge may be and the patient is usually willing to pay for services rendered whether the physician be attached to a hospital or not There may be a great amount of soul satisfaction on the part of the physician who serves a hospital but they should more frankly appreciate that although they render service to the poor, the hospital is also rendering service to them

Workmen's Compensation

It is now well appreciated in this country that workmen's compensation is here to stay and it is recognized that ill health, accidents, injuries and death are frequently the result of industry and that the particular industry in which an individual is engaged should bear the cost of the workman's financial loss. Compensation is awarded for injuries, illness and death in New York State. Prior to the enactment of the Workmen's Compensation act in 1913, the employee was frequently forced to

feeding the offices of physicians with patients who would not ordinarily go to their family physician On the other hand the supposition arises as to whether physicians employed by the Life Extension Institute are not also subject to the same human temptation as are physicians in out-patient clinics and may endeavor to persuade the clients of the Institute to come to their offices for advice and treatment

Here again is an example of a private organization attempting to persuade individuals who are not in the habit of having a physical examination to have one and to see that if needed the patient is placed under proper care and is increasing the total amount of medical practice

PAY CLINICS

In New York City one pay clinic has been successful to the extent that after two years of a deficit it has been able to complete its third year with a surplus over and above its cost of maintenance The report for the year ending 1927 shows that thirty odd thousand patients made 133,108 visits to the clinic at a total cost of \$305,000 The patients paid \$150 per visit and additional sums for special services, the average cost being \$229, the physician paid on a salary basis, received on an average of \$74 per patient per visit

The clinic has therefore demonstrated that it is possible for a minimum fee to provide patients with all special types of examinations and to practice medicine by the group method at this low cost Naturally this is resented by the average general practitioner who cannot furnish the necessary diagnostic test or his own professional advice for any such amount

of money

This brings up a difference of opinion between the individualism of the physician and the collectivism of the group clinic. In the group clinic by proper division of labor and the employment of a considerable staff of clerks and nurses it is possible to reduce the amount of time given by any one physician to any one patient, and proves the well-known economic law that proper division of labor diminishes cost and increases production

STATE MEDICINE

Just exactly what state medicine is has never been satisfactorily defined The report of the Committee on Education of the Toledo Academy of Medicine⁵ defines it as follows Medicine may be defined as referring to the extension of governmental activity in the health field, by creating compulsory health insurance or free and pay clinics or distributing physicians, or seeking complete control of medical practice as a public utility"

On the other hand, State Medicine might be

defined as the practice of medicine under the

supervision, control and pay of the State is generally acknowledged that the State, which in this sense includes local authorities has expanded in many ways which affect the practice of medicine and that these activities may be termed by some "State Medicine"

If the Toledo definition be an accurate one, the existence of a State Health Department is State Medicine, the operation of a traveling free clinic for the diagnosis of tuberculosis under the direction of a health department is State Medicine It does not seem possible, however, to conceive of a free or pay clinic operated by a voluntary agency in accordance with the present laws for medical practice as State Medicine

A proposal in the legislature of this State. some ten years ago, which would have authorized counties to establish general hospitals in which every physician in the county would be permitted to send his patients and care for them was opposed by medical societies as State Medicine

DEMONSTRATIONS

Health demonstrations have also been defined as State Medicine and a number have been carried on in this country during the past eight years, nearly every one of which has received a good deal of criticism from the medical profession, primarily from the county society of the county in which the demonstra-tion was at work. These criticisms are numerous and are caused by the fact that there is a marked increase in the amount of health and medical work in the community part of which is carried on by the regularly constituted authorities, part by the medical profession and at times part by the demonstration officials themselves

In each of the demonstrations there has been an underlying principle that if it were effective it would result in increased appropriations made by the local authorities for the purpose of extending health work. If for example, at the beginning of the demonstration, it were known that the milk and water supplies were not safe-guarded, that there was no machinery for the control of tuberculosis, that there were few, if any, health activities except the quarantine of contagious diseases and the abatement of nuisances, and that the demonstration had brought about the creation of official machinery which had corrected the insufficiencies, and that all the work carried on was performed by the regularly constituted public health authorities there would still be criticism on the part of the medical profession These criticisms are the following

State Medicine By some members of the medical profession any extension of publie health activity, school hygiene or the estions which may affect himself and not directly the health of others in the community. In these efforts, the work of health departments has usually been limited to diagnosis and advice and not the giving of medical treatment

Another extremely important activity which has been carried on by health departments in some places, and in many others by departments of education is the physical examination of school children Physical examinations of school children reveal the presence of an enormous amount of needed medical care During the school year 1926-27, there were 796,000 children registered as pupils in the state outside of New York City Of these, 616,000 were examined and 580,000, or 77% revealed physical defects 274,000, or 47% were placed under treatment The figures in New York City are quite comparable In one of the more recently published reports of the New York City Health Department for the year 1925 in the table of defects shown, it is noted that there are 54,000 cases detected with tonsillar defects, tonsil defects eradicated—25,000, by medical, 6,000, by surgical, 11,000, and by other measures, 456 One wonders what has become of the other 8,000 whose defects are reported as terminated

The physical examination of school children shows very clearly another fact, that only one-half of the children are treated and treatment is only frequently obtained by repeated efforts of school nurses and school physicians and teachers and it is commonly found that the parents are unwilling to have their children treated unless the treatment can be obtained free. The most important fact however, is that one-half of the children who are found to have defects are never placed under treatment.

The functions of the modern health department demonstrate that here again society is endeavoring to see that individuals are given better medical treatment and that more of them are given the opportunity to secure medical care and the intense interest as shown by health departments and voluntary agencies is such that their employees do not always display the necessary discrimination in ascertaining the financial status of the individuals whom they advise to have treatment

There is no question but that health department activities have to a considerable extent increased the total amount of medical practice. In our larger cities it is quite likely that the bulk of this practice has been cared for in hospital and dispensary but in the small cities and rural districts, the physical examination of school children has undoubtedly contributed enormously to medical practice in these areas. More than one specialist in laryngology has stated that the physical examination of school children revealing abnormal tonsil or pharyn-

geal conditions made the practice of their specialty financially successful

LIFE EXTENSION INSTITUTE

The idea underlying the Life Extension Institute is entirely sound in that the Institute desires to give a complete health examination to adults to make a report of findings and to refer the individual to his physician. Life Insurance companies refer their policy holders to the Life Extension Institute and find that patients who have been examined by the Life Extension Institute and placed under treatment by their own physicians, have a lower mortality than those who do not have a regular examination

There are two objections made to the Life Extension Institute—first, that it advertises, and second, that as a corporation, it is engaged in the practice of medicine By advertising, the Life Extension Institute undoubtedly conveys to the public that it offers something to individuals which they could not ordinarily obtain from their family physicians not true in many instances but there are physicians, not only the specialists, but others in general practice of medicine, whose offices are not equipped for making a complete examination, and in order to obtain the frequently needed laboratory tests and examinations a larger amount of time and money must be expended by the patient to complete his examination

The Life Extension Institute renders a written report to the individual examined, who is supposed to take this report to his family physician The patient may read in the report that there are lesions in the lung, that there is a murmur in the heart, that casts are in the urine and a variety of other abnormalities or conditions, the knowledge of which may seriously affect his psychological condition When the individual takes this report to his family physician, his family physician may have a different opinion from that recorded by the ex-This may amining physician at the Institute produce a lack of confidence in the mind of the patient In order to restore the patient's confidence and to re-establish his psychological equilibrium it may be necessary for the patient to make several visits to his family physician or even necessitate a consultation in order to assuage his feelings

Insofar as the Life Extension Institute may interfere with the practice of medicine this does not seem to be tenable for the advertising of the Institute undoubtedly persuades large numbers of individuals to seek examination at the Institute who would not go to their family physicians, to whom they are subsequently referred, for advice and treatment The Institute is therefore to a certain extent

voluntary agency, industry, hospital or clinic Statements are made that salaried physicians are incompetent, neglectful and give inadequate care to their patients and because they are paid salaries No, men in business, in government, in the practice of medicine, may lack character and commit the same errors and succumb to the same temptations, but let us remember that salaried physicians are members of our great profession

It is obvious, however, that physicians who are on a salary usually have their office equipment provided for them, are not required to pay their own overhead costs and with salaries commensurate with their capabilities and positions which they hold, they are satisfied to ac-

cept full-time positions

The impression has been gained that although organized medicine is in opposition to many of the projects launched which interfere to some extent with medical practice and diminish the economic cost, yet it forgets that these projects furnish employment for physicians at salaries which are satisfactory to them The criticism has been specifically made against a pay clinic because the physician received the mere pittance of \$75 per patient It is forgotten, however, that the physician receives from four to seven dollars per afternoon clinic session and his economic situation when serving the clinic three times a week for from 700-1000 annually is better than that of his colleague who works in another clinic for the same amount of time for nothing

In other words, many of these projects which seem to be opposed or criticized by organized medicine provide for the economic security of a considerable number of other physicians and the total number of salaried physicians occu pied in these various activities is steadily in-

SUMMARY

During the past twenty-five years there has been an enormous increase in medical knowledge which is made use of to a great extent for the diagnosis and treatment of disease

There has been an enormous increase in the number of specialists because a limited field of knowledge is relatively easier and specialists are able to charge a higher fee than the general practitioner for similar services

Many physicians have acquired the acquisitive instinct and the commercial spirit has invaded the medical profession to a certain extent The acquisitive instinct and the large increase in the number of specialists has resulted in mounting costs for medical care and a large increase in expenditure of time by patients

Official and voluntary agencies have endeavored successfully to extend the practice of preventive medicine and frequently have carried on activities which provided diagnosis and advice in this field. This practice of preventive medicine has largely increased the practice of curative medicine Efforts have been made by other agencies to diminish the cost of medical care, primarily by industry, hospitals and pay clinics

Organized medicine is usually hostile to any new project which endeavors to promote an increase in the practice of preventive and curative medicine Grganized medicine is very commonly opposed to any activity which competes with the practice of medicine or tends to reduce the economic cost of disease Organized medicine opposes lay organizations and health departments on the ground that they are carrying on State Medicine and it has an ill

defined fear of State Medicine

Many of the activities carried on by official and voluntary agencies create fear in the minds of many leaders in organized medicine of a loss of economic security to many members of the profession Many physicians maintain a laissez-faire policy and do not see any necessity for the State, society or voluntary agencies to promote the practice of preventive or curative medicine Many new projects are already launched before they come to the attention of organized medicine and organized medicine finds itself in opposition

What of the Future?

As medical service saves money to industry, the number of physicians employed on fulltime salaries will increase in this field

As hospital and dispensary work conserves the time of the physician and the patient, the number of physicians employed in these institutions will increase In rural counties, hospitals will be constructed and will be managed as open hospitals

As physicians learn that group practice conserves their time and permits them to see a larger number of patients daily, they will form

group practices to a larger extent

As pay clinics are group practice and diminish cost, they will increase in number even though they may compete with private prac-

In our larger cities, the number of individualistic general practitioners will diminish in number

An increasing number of efforts will be made to extend medical care to those who do not now get it and more adequate medical care to those whose care is now insufficient

These efforts will be made by official and

voluntary agencies

Who will give this medical care, under what auspices, how it will be financed and how payments will be made may prove to be one of the most vexatious problems to confront us during the next decade

tablishment of any clinic whether for diagnosis or treatment, is "State Medicine"

2 Competitive Advertising For a period of twenty years a number of health associations in this country with the approval of the local county societies and sometimes without it, have established clinics for the indigent poor and after a period of successful operations have recommended that the clinic be maintained at public expense. In order to transfer the maintenance of this clinic to the public agency within a reasonable length of time a considerable amount of propaganda work is neces-This advertising of the clinic or propaganda is carried on in the press, at public meetings, at the meetings of private agencies and also, in a quiet way by the nurses employed by the clinic The efforts to bring about the transfer of the clinic to public authorities have almost always been successful

The advertising of the clinic, however, makes many physicians feel that the clinic is competing with the private practitioner, that patients accepted at the clinic are not always indigents and that this is unfair competition with the physician who is unable to advertise

3 Loss of Prestige The activities carried on in demonstrations have the entire approval of the medical profession but they may be new to the locality and as they have been inaugurated frequently as the result of the activities of a lay organization there may be a feeling in the minds of the local physicians that this is something that they should have done had they thought of it first. The physicians also feel that the advertising and propaganda and the mere extension of the clinic or other activity offers some service which can not be rendered by the private physician

4 Effect on the Physician Generally In a number of these demonstrations experts have been employed who have been imported into the locality which may cause some jealousy on the part of the local physicians, patients are examined and diagnosed and referred to their family physicians and it not infrequently happens that the full-time paid expert gives a more chorough and careful examination than the average family physician Whether such thorough examination is necessary or not, it undoubtedly produces an effect on the patient which makes him draw invidious comparisons between the imported expert and his own physician

All of these things may appear to be harmful to the medical profession and may make it feel that its prestige has suffered in the eyes of the public, yet in each demonstration area it is believed that the demonstration has brought about a marked improvement in public health work and a diminution in morbidity and mortality and an improvement in the

standard of practice, and what is more important, a demand on the part of the patients for more careful examination, and a higher standard of medical care. This influence on the standard of the practice of medicine may be denied by members of the profession who have been in the demonstration areas, yet it is believed to be a fact.

A number of criticisms have been made of all the various activities which have been promoted by official and voluntary agencies which have been promoted for the purpose of reducing the cost of medical care or extending medical practice, on the ground that it was paternalism It has been stated that if free medical care is given why not free rent, free clothes and free food and the authors of these statements have failed to recognize a very important difference between medical care and the obvious necessities of life There is no doubt that there are today hundreds of thousands of individuals in New York State who do not receive any medical care or only casual medical care on rare occasions. If the situation were reversed and medical care were a daily essential to existence and clothing and food only absolutely essential perhaps once in a life-time or at birth and death, societies would be organized to provide those most helpful and useful commodities free or at reduced cost

Leaders in the medical profession have expressed the feeling that any medical activity which does not assure the economic position of the physician is fundamentally unsound, and that the economic security of the medical profession is essential to any health program These ideas may be sound from the point of view of medical economics but they do not Government express sound economic theory has interfered with business and notwithstanding the Constitution of the United States, which specifies that property shall not be confiscated, laws and regulations have brought about the loss of money or complete failure to various financial projects which were not The idea that the only useful but harmless medical profession must have its economic security maintained seems to be the expression of a conviction that the monopoly of individual medical care must be maintained and that society must not compete with the general practitioner

The medical profession resents competition and it is quite obvious that health departments, pay and free clinics, hospitals and other institutions encroach upon the domain of medical practice and compete with the general practitioner

There is undoubtedly opposition on the part of organized medicine to the salaried physician whether he be employed by health department, theloid changes, and the underlying blood vessels are markedly congested. This advance in the evolution of the corpus luteum is designated as the state of proliferation (Fig. 3)

The proliferative state is followed by the one of vascularization (Fig 4) The structural

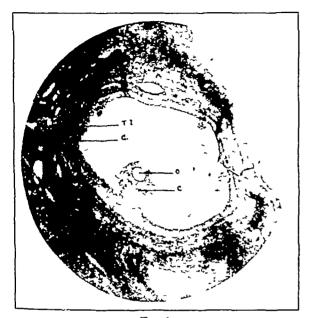

Fig 1
Maturing follicle Ozule (O), Cumulus (C), Theca
Interna (TI) Granulosa (G)

characteristics of this phase are a pronounced vascularity of the theca interna, from which

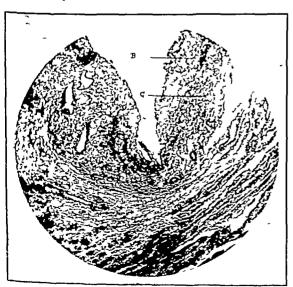

Fig. 2

Corpus hemorrhagicum—The interior of the follicular cavity is lined with a layer of free blood (B) and fibrin, under which is the hypertrophied layer of granulosa cells (G) beginning to form into lutein cells

numerous delicate capillaries extend into the greatly hypertrophied granulosa, which by

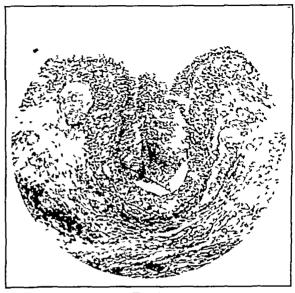

Fig 3

this time is thrown into many folds. The granulosa cells have by this time also taken on a distinct epitheloid or lutein appearance. The

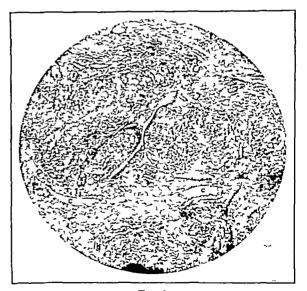

Fig 4

Corpus luteum-state of Vascularization The capillaries
(C) in the theca interna (TI) are engarged The lutein cells (LC) are arranged into lobules, separated from each other by connective tissues septa (CTS) extending inward from the theca layer

cell bodies are larger, lighter in color, and of a yellowish tint, due to a deposit of lipoids,

As the number of medical students is limited and as medical care increases, there will be a shortage of physicians in this state within the next fifteen years

As specialism has brought in its train a number of difficulties, the legislature will provide standards of admission to special practice

As the value of preventive medicine is appreciated by life insurance companies, industry and the public, it will be promoted and practiced more extensively by the medical profession

As soon as society appreciates more generally the importance of extending medical care and the possibility of diminishing its cost, the organized medical bodies will be consulted more and more when new projects are considered

"If Medicine is to remain worthy of her divine origin, she must flash the light from the car of Phoebus cine must anticipate, inspire, and guide policy, and not rest content merely to carry out instructions im-

posed on her Her chartered institutions, Colleges, Faculties, this powerful Association, and other collective groups must not limit themselves as they commonly do to criticisms of proposals which reach them from without, and to grumbling at the terms of statute and regulation to which they are asked to conform They must envisage and mould the developments of the future"

OOPHOROGENIC AND PSYCHOGENIC UTERINE BLEEDING*

By M R ROBINSON, MD, FACS, NEW YORK, N Y

ROM time to time we resort to hysterectomies in order to stop troublesome uterine bleeding, after having performed many The recent advances made useless curetages in the histopathology of ovulation and menstruation, in endocrinology, in neuro-anatomy and neuro-physiology, have taught us, that many types of uterine bleeding could be controlled or obviated by far less drastic measures, than those applied hitherto, if we understood their true cause There are many types of uterine bleeding the etiology of which is to be sought in functional and organic disturbances of the ovary, and in abnormal psychic reactions, and not in the uterus, the latter acting only as a medium through which these disorders find an outward expression

The approach to the study of the pathogenesis of oophorogenic and psychogenic uterine bleeding requires an orientation in the following branches of knowledge (a) the structural changes occurring in the ovary and in the uterus during the ovulating cycle, (b) the location and the nature of the stimulus that calls forth these structural changes, (c) the manner and method of its distribution, and (d) the nervous mechanism of the generative sphere and its relationship to the higher nerve centers

The Histopathology of Ovulation and

*Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls, N Y, May 10 1927

Every month during the pro-Menstruation creative life of the woman, one of the many graafian follicles competing for a complete ovulation, succeeds in accomplishing this goal Such follicle (Fig 1) becomes larger than its competitors, by virtue of its growing cumulus and ovule, and by virtue of its increasing liquor folliculi These dimensional gains force the follicle nearer and closer to the surface of the ovary, and as the intrafollicular tension increases it stretches the follicular wall to its outmost capacity, which in due time gives way together with the overlying ovarian tissue The liquor folliculi is spilled into the peritoneal cavity as well as the ovule, which is carried along by the intraperitoneal peristaltic waves to the fimbriated end of the tube, where it awaits impregnation

The rupture of the follicle is associated with the tearing of some fine blood vessels, the blood escaping from them finds its way into the follicular cavity, spreads itself upon the membrana granulosa as a thin layer, and thus constitutes the corpus luteum hemorrhagicum (Fig 2)

From now on the hyperplastic and proliferative changes in the corpus luteum formation proceed with increased intensity, presenting the following successive morphologic states membrana granulosa becomes folded due to the increased proliferation of its cells cells in the theca interna show definite epilogic changes, which bear-a timely relationship to those occurring in the generative gland. The first morphologic change noted in the en-

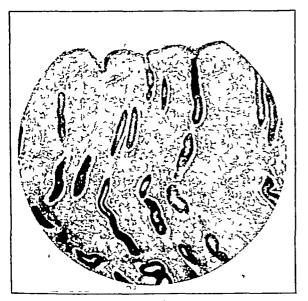

Fig 8

Uterme mucosa-begining of the Interval The glands still retain a straight outline, narrow lumina fairly high columnar epithelium, moderate interglandular secretion, and a proponderating amount of interglandular stroma, rich in lymphocytes

dometrium is its transition from the resting state to that of the beginning of the interval (Fig 8) This phase is denoted by the straight outline of the glands, the narrowness of their

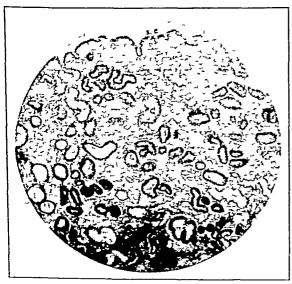

Fig 9

l terme mucosa at the end of the Interval Surface epithelium (S.E.) intact, stroma (STR.) of looser consistency edematous and its cells show a rounded outline, the glands (G) are more tortuous, their lumina wider, and actively secreting

lumina, the moderate secretion, and the predom nance of the strom togenous element From the beginning of the interval the endometrium passes to the end of this phase (Fig 9), characterized by an increase in the tortuosity of the glands, in the height of the columnar ep thelium, in the amount of secretion, and a looser consistency of the stroma, whose cells assome a more oval instead of a spindle shape

The next change in the endometrium is that of the premenstrual or pregravid state (Fig 10) which presents the following change. The surface epithelim is intact, the columnar cells high and covered with cilia, the cell bodies enlarged. The uterine glands very irregular in outline, with paillary formations as a result of the increased hyperplasia of the lining epithelium, and an increased secretory activity. The closer the time interval approaches the

Fig 10

Uterme mucosa-Pregravid or Premenstraul phase Stroma (Str.) cells show a more advanced epitheloid formation, the endomentrial glands (G) still greater torthosity and more excessive secretion. The surface epithelium (S.E.) is still retained

premenstrual or prenidation state the more pronounced are the changes in the parenchyma and in the stroma

If the ovum has imbedded itself in the uterine mucosa (Fig. 11), then the endometrium undergoes still further changes. It becomes differentiated into two distinct layers, an upper denser layer, consisting mainly of decidual cells and an abundance of fine blood vessels, known as the compacta, and a lower softer layer, the spongiosa, which is made up of corkscrew like glands, and very little interglandular stroma. The rest of the uterine walls also show an hypertrophy and hyperplasia of the mulcularist an increased vascularity, and a progressive state of atony

and the nuclei are prominent. The delicate blood vessels wind their way in and between the lutein cells in such a manner as to form an almost complete envelop for each cell. On reaching the inner border of the lutein layer these blood vessels anastomose. In the course of this vascularization process some of the blood vessels break, and free blood is found between the lutein cells, as well as in the interior of the follicle cavity, where it coagulates and forms a central plug

With the return of tension equilibrium in the congested and distended blood vessels, the corpus luteim passes from the state of vascularization into the state of flower (Fig. 5)

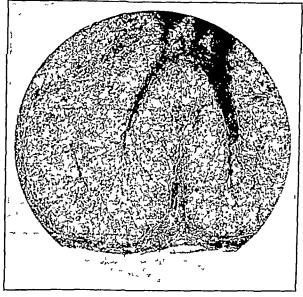

Fig 5
The corpus luteum in flower

This phase is associated with a distinct and clear outline of the greatly enlarged lutein cells, a homogenuity of the cell protoplasm, and well stained nuclei. The lobular arrangement of the corpus luteum is also more definite, and the dividing septa have a distinct connective tissue character.

If impregnation follows ovulation then the coppus luteum retains its flowering state during the first four or five months of gestation, and is then known as the corpus luteum of pregnancy (Fig 6). The characteristics of this state are, a gradual and almost imperceptible loss of the body outlines of the lutein cells, some of which also show shrinkage and hyaline degeneration, with distinct nuclei. Although the placenta assumes the function of the corpus lutering after the fourth or fifth month of pregnancy this morphologic state is retained throughout the entire period of pregnancy.

When the ovule fails to become impregnated then the corpus luteum undergoes involution

or regression (Fig. 7). Its cells lose their outline, they become vacuolated, the nuclei dis-

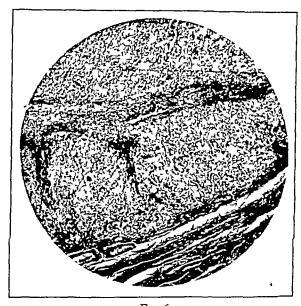

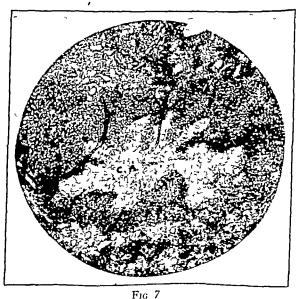

Fig 6

Corpus luteum of pregnancy, beginning hyalimisation of the lutein cells with loss of body outlines, and nuclear degeneration

appear, the connective tissue organization assumes wider proportions, and a corpus albicans is formed. This morphologic change is completed within six to seven weeks after ovulation.

While the above described structural alterations proceed within the ovary, the uterus, es-

Corpus luteum-state of regression, lutim cells (LC) show vaculation with degeneration of the nuclei, and corpus albicans (CA) formation

pecially its mucosa, also undergoes morpho-

Schroeder and others have performed similar experiments with the ovaries, and have arrived at the same conclusions The clinical verification of this truth was first demonstrated by Robert Morris of N Y in 1895 and 1906 Other American surgeons, Palmer Dudley, Frank, Franklin H Martin, S Bainbridge, and others have obtained gratifying results with ovarian transplantation Tuffier of Paris also had a very extensive gratifying experience with ovarian transplantation And while all these facts prove that the blood and lymph streams are the vehicles by means of which all the incretions are carried and distributed to the body, yet it is essential for the proper and physiologic regulation of the functions of the incretory glands, that their anatomic connections with the vegetative and cerebro spinal nerve centers remain intact For the regulation of the incretory mechanism is carried out by the autonomic nervous system, which in turn is activated by the internal secretions

3 The Innervation of the Generative Apparatus (Fig. 13) The uterus has an inde-

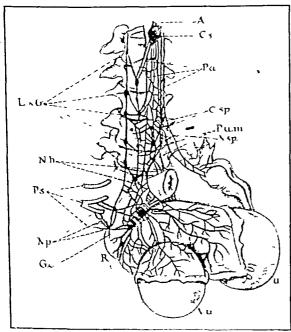

Fig. 13

The vegetative nervous system of the gento-urinary tract (After Frankenhauser—Gugisberg) Aorta (A), Solar ganglion (G.S), Aortic plexus (Pa), Lumbar sympathetic ganglia (Lg.s), Spermatic ganglia (Gsp), Plexus uterinus magnus (Pum) Spermatic nerves (Nsp), Hypogastric nerve (Nh), Sacral plexus (Ps), Pelvic nerve (Np), Cerucal ganglion (Gc), Rectum (R), Uterus (U), Urinary bladder (Vu)

pendent nervous system, made up of groups of ganglia, arranged as follows The fundal ganglia are located underneath the pertoneum covering the upper part of the uterus, the cervical

ganglia of Frankenhauser are in the posterior paravaginal tissue, the paracervical ganglia of Knupfer are in the paravaginal tissue at the level of the insertion of the vaginal walls into the cervix, and the vaginal ganglia of Dembo are in the paravaginal tissue of the anterior vaginal wall

By virtue of these innervations the uterus is capable of responding to the ovarian hormones in the form of contractions and relaxations, without the necessity of an anatomical relationship to the rest of the nervous system. This fact was verified by V. Goltz experimentally, and substantiated clinically by observations on paraplegics who conceived and went to term and delivered normally.

But in order that the uterus may also receive and send out impulses from and to nerve centers other than its own ganglia its anatomical continuity with the rest of the vegetative and cerebro-spinal nervous systems is necessary

The motor sympathetic nerves of the uterus are the hypogastrics. They arise from a common trunk in the great uterine plenus, which lies in front of the aorta opposite the body of the fifth lumbar vertebra. They descend to the right and to the left of the rectum and then to the sides of the uterus. The upper part of the uterus, the tubes and the ovaries are innervated sympathetically by the spermatic nerves.

The sensory, parasympathetic nerves of the uterus are the pelvic. They are formed from branches given of from the anterior surfaces of the second, third and fourth sacral nerves, and terminate in the cervical ganglion. The pelvic nerves also send sensory fibres to the rectum, the bladder, the vagina and the external genitalia

Through the communicating nerves the nutonomic nervous system of the generative organs is brought into relationship with the spinal nerves, and through these again with the brain centers. In this way the uterus and its adnexa may receive centrifugal motor stimuli from the cerebro-spinal and vegetative nerve centers, and in turn register centripetal sensory responses in these very centers.

Since all autonomic functions whether of an acceleratory or inhibitory nature represent the responses of the nerves to some activating force or hormone, it is essential to know what effect does the ovarian hormone have upon the vegetative nerves. Seitz and Wintz have shown that the extracts of young corpora lutea will inhibit the contractions of smooth muscle fibres in the walls of the blood vessels. A similar result was obtained by Gugisberg in the smooth muscle fibres of the uterine walls. Schickele has shown that the extracts of the corpus luteum containing ovaries, or of the

When ovulation does not culminate in impregnation, then the ovum is absorbed, the corpus luteum involutes, the uterine walls and

Fig 11

Nidation of ovum (O) in the uterine mucosa, consisting of compacta (Com) and spongiosa (Spon), the latter resting upon the muscularis (M). The ovular capsule (OC) surrounds the ovum, and at the right lower quadrant the decidua reflexa (D.R) and decidua vera (DV) are seen

its blood vessels regain their normal tonicity, rhythmic contractions set in once more, the

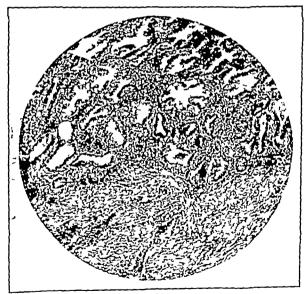

Fig 12

Menstruating nucosa, the superfucial layer of epithelium is wanting, the uterine glands in the functional layer (\$\Gamma I\$) are disintergrating their epithelium is breaking iip and is mixed with mixed and free blood, the glands in the basal layer (\$BL) retain a normal structure lying close to the muscularis

overdistended uterine glands are compressed, their mucus is forced to the surface, and as it is poured out it causes a dissolution of the superficial epithelium, by its lytic properties, and the phenomenon of menstruation (Fig 12) is witnessed. This phase is typified by a loss of the superficial epithelium, a breaking up of the functional layer of glands, most of which are cast off, excepting the fundal portions out of which the new glands regenerate, a rupture of many capillaries, and finally a discharge from the uterus of the freed mucosa, the escaped blood, the mucus and detritus, which constitute the menstrual secretion

The fact that the human female, the only species in the entire range of verterbrate zoology, has adjusted herself so perfectly to an otherwise pathologic condition, to menstruation, does not warrant our consideration of this phenomenon as a physilogic process. At best we may say that it is a convenient adaptation or subjugation of a biologic function to the dictates of culture and civilization, for the biologic intent of ovulation is impregnation and not menstruation We must also note that there is an intimate timely relationship between the ovarian and the uterine morphologic alterations, as depicted above, which implies that both these organs are dominated and influenced by common secretory and nerve impulses

The Ovarian Hormone, and Its Manner of Distribution and Regulation — The researches of Zondek and Aschheim, Long and Evans, Allen and Doisy, Robert T Frank and others, show that the active principle of the ovary is "folliculin," the serous fluid contained in the follicular cavity This fluid is elaborated by the granulosa lutein cells and by the theca lutein cells Its function is to activate the uterus to undergo the necessary hyperplastic changes requisite for the reception and the harboring of the impregnated ovum Zondek has also shown that the hormone elaborated by the anterior lobe of the pituitary is in turn the activator of the ovary At or about the fifth month of pregnancy the incretory function of the ovary is taken over by the placenta, which promotes still further the structural alterations necessary for the continuation of the pregnancy to term

How does the ovarian hormone reach the uterus and other endocrines? Before the experimental era with sex gland transplantations it was assumed, that the internal secretions travel to their points of destination along nerve paths. Bertold in 1849 has shown that when he castrated a fowl and has transplanted its testicles to another part of the body, the cock maintained his libidio and secondary sex characteristics undisturbed. This proved conclusively that the secretions elaborated by the testicles manifested their activity through the blood and lymph streams

Knauer, Robert Meyer and Ruge, Robert

be reduced to a single layer of low cuboidal epithelium, or it may be wanting altogether. The ovarian stroma is correspondingly reduced in quantity. Recent or active corpora lutea are conspicuous by their absence, and only a few corpora albicantia or fibrosa may be seen here and there

How do these morphologic changes in the ovary disturb the physiology of the uterine lin-ing? A critical analysis of the histopathology of microcystic ovarian degeneration leads to the following deductions Since the parenchymatous portion of the generative gland is the element chiefly affected in mycrocystic degeneration, as evidenced by its relative increase, its function is also necessarily augmented This fact makes itself evident through the ensuing hyperplasia of the endometrium, which simulates the morphologic changes associated with the pregravid or premenstrual states The endometrial changes would have been insignificant if they were the result of the stimulation of one or two cystic follicles, but when numerous follicles thus affected exert their combined effects upon the uterine mucosa, the result is quite potent, as seen by the excessive glandular hyperplasia (Fig 15) present in

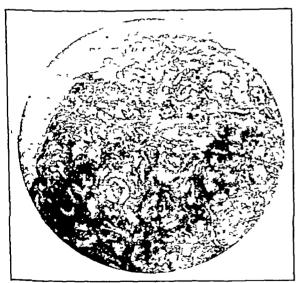

Fig. 15

Glandular hyperplasia of the endometrium. Note the excessive structural and functional state of the uterine glands, frequently encountered in cases of cystic degeneration of the Granfin follicles

these cases The cumulative force of these stimuli is further increased by the absence of the antagonistic influence of the corpus luteum, which as pointed out above, is wanting in microcystically degenerated ovaries. The absence of corpus luteum secretions permits the motor sympathetic fibres to act freely, the adrenaline output to continue unhindered? the

muscular rhythm in the uterine and blood vessel walls to function, which brings with it the rupture of the finer capillaries as soon as the hyperamia in the endometrium become excessive and uterine bleeding occurs. This bleeding becomes excessive and irregular because the follicles do not complete their ovulating cycle, therefore no corpora lutea formations, and no in 1) ingeend regulating mechanism.

In my own experience I have had the opportunity of restoring normal menstruation after resecting most of the cyst bearing portion of the ovary or ovaries, without preliminary curettages I shall cite but one instance

Case No 23949 Beth Israel Hospital, R. H, age 29, married eight years. Has given birth to one child six and a half years ago, the pregnancy and the puerperium were normal. Her menses began at fourteen, and were normal up to five years ago, since then they are frequent, occurring every two to two and a half weeks, and profuse. She remained sterile since her first pregnancy, but states that eight weeks preceding her admission to the hospital, she believes to have had a spontaneous miscarriage of about seven weeks. Her chief complaint on admission was metrorrhagia since her supposed miscarriage. For ten days preceding her coming to the hospital amenorrhea

Physical examination—The uterus is firm in consistency, normal in size, retroverted, freely moveable, regular in outline and easily replaceable. The external os is closed, and blood oozes freely from the uterine cavity Both ovaries are enlarged to about twice their normal size, and cystic. Preoperative diagnosis— Oophorogenic uterine bleeding Operation—Resection of the cystic areas from each ovary On the second day after the operation the uterine bleeding ceased Pathologic report-Cystic degeneration of many follicles, some corpora albicantia, no recent or active corpus luteum. Comment—From the histopathologic findings it is hardly possible to attach any weight or importance to the patient's statement about her recent pregnancy. Her prolonged bleeding as well as the recent amenorrhoea for seven weeks must be considered in the light of her ovarian dysfunction, from which she has follow up of other patients, similarly affected and treated shows that in many of them normal menstrual cycles was established

The amenorrhea and sterility observed in cases harboring an unabsorbed corpus luteum of pregnancy, or a true corpus luteum cyst, lends further support to the correctness of the above theoretical and clinical concepts

4 Uterine Bleeding in Cases Afflicted with Care noma of the Ovaries Cancer involving the generative part of the ovary, i e primary ovarian carcinoma, can cause uterine bleeding at any period of life, before the establishment of puberty, and long after the onset of the menopause. On the other hand secondary cancer of the ovary, in which the cancer cells are brought to it by the lymphatics, and the cancer nests lie in the stroma and in the connective tissue septa of the generative element, which they destroy by pressure does not call forth endometrial hyperlasia and uterine bleeding. What is the functional correlation be-

corpus luteum itself, diminish or suspend adrenaline output

With these theoretical facts before us, we shall now proceed to a consideration of their clinical manifestations

II CLINICAL PART

A OOPHOROGENIC UTERINE BLEEDING

I y the sterminology we designate types of uterme bleeding in which the iterus as such acts at the end organ through which structural and functional disturbances in the ovary find an outward expression. The effects of these ovarian disorders are first transmitted along afferent sensory nerves of the vegetative system to the spinal nerves, then to the palaencephalon (especially the pituitary), and from there back again along the efferent motor sympathetic fibres (the hypogastrics) back to the uterus, and the endocrines which stand in close relationship to the generative apparatus. The following types of uterine bleeding will serve as illustrating examples

1 Uterme Bleeding in the New Born From time to time we encounter a bloody vaginal discharge in the new born, of a mild character, which lasts from three to four days and stops. An examination of the external genitalia shows that they are swollen and congested, and that frequently we also find a concommitant swelling of the mammary glands. The recorded microscopic examinations of the uteri of such infants, showed a fetal arrangement of the uterine walls and their endometrium, but there was a marked dilatation and congestion of the capillaries right under the mucosa. Whose internal secretions have stimulated the infantile uterus and breasts?

It is Halban's opinion, that the hormones which circulate in the blood of the gravida, and call forth in her external and internal organs of generation, and in her endocrines, all the necessary structural and functional changes requisite for conception, gestation, birth and subsequent nourishment of the infant, also circulate in the blood of the fetus, and hence effect its corresponding organs in a similar but less vigorous manner After birth these hormores are withdrawn from the infant's blood stream, the inhibitory effects exerted by the corpus luteum and the placenta upon the hypogastrics and the adrenals cease, and the rhythmic contractions of the uterus and its blood vessels return, and as a result of the re-establishment of tonicity, many of the finer capillaries in the endometrium break, and a miniature menorrhagia or menstruation occurs, the uterus involutes, and with it also the mammary glands

2 Uterine Bleeding in Entrauterine Prequancy As long as the extrauterine ovum is

alive no uterine bleeding takes place, but the moment the embryo dies, metrorrhagia sets in How does the death of the ectopic ovum effect the endometrium? While the embryo was alive, the corpus luteum of pregnancy maintained in the endometrium all those structural changes characteristic of pregnancy, as well as the soft and atonic state of the uterine walls and its blood vessels. With the occurrence of embryonic death, the corpus luteum regresses, its inhibitory power over hypogastric and adrearl function ceases the muscle tone in the uterine walls and its blood vessels returns, contractions set in, minute hemorrhages take place in the endometrium, the decidua is cast off, and uterine bleeding ensues

3 Uterine Bleeding Associated with Microcystic Degeneration of the Ovaries Microcystic degeneration of the ovaries (Fig 14) is characterized by the conversion of very many

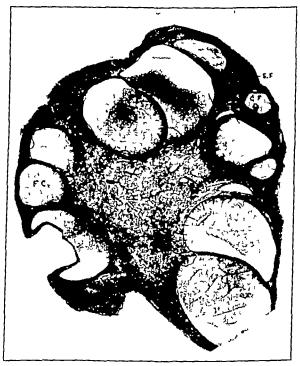

Fig 14

Microcystic degeneration of the ovary Follicle cysts (FC) of various dimensions predominate, no recent or a tive corpora littea, a corpus albicans (CA) in the center, secondary follicles (SF) as well as tertiary (GF) are present and active

follicles into cystic spaces of various shapes and sizes, filled with liquor folliculi, and lined with one or more layers of granulosa epithelium. The quantitative proportion of granulosa epithelium present in the cystic follicles depends upon the degree of intrafollicular tension, the smaller the cyst the more numerous the rows of granulosa cells, and vice versa. In the very large cysts the granulosa cells may

titudes towards life as a whole, are appraised, evaluated, discounted and weighed in the scales of his intellectuality

Inner struggles and soul conflicts can therefore arise only in persons with an ambivalent complex, i.e., individuals who cannot adjudge and evaluate sensations and experiences properly, and who react to them in a greatly evaggerated manner, or even in an opposing direction. Properly balanced or very primitive types of individuals are as a rule not troubled with "ambivalency", for the cultured person can tame his primitive urges to a very large extent, and the uncultured gives vent to his emotions in a free and untrammeled manner, irrespective of consequences and results.

Wathard states that the psychically conditioned pathologic symptomicomplexes affecting the female generative organs may arise from

the following disorders

(a) When unchanged physiologic reflexes occur untimely, in an improper place, and in an abnormal measure, or when they run their course with increased ease and rapidity, or when they fail to appear. These disturbances interfere with the reciprocal reactions and restitutions of the individual organs, or organ groups, and finally with the organism as a whole, and become conscious functional disorders.

(b) When pleasant sensations previously perceived subjectively, become objective

(c) When several nerve and incretory reactions encounter each other at the same time in the motor and the sensory apparatuses of the female genitals

We shall now proceed to the consideration of some specific physiologic disorders in the female genital organs caused by abnormal

psychic reactions

1 Psychically Caused Premature Separation of a Normally Situated Placenta Most of us have had cases of repeated early abortions for which no adequate clinical cause could be found, after the most careful and searching inquiry and investigation. Is it not possible that some psychic trauma is at the basis of these hitherto unexplainable terminations of early gestation? Walthard cites cases of retroplacental bleeding due to purely psychic reactions. Let us analyse this symptomcomplex, and see how psychic shock is transformed into physical damage to the uterine mucosa.

During the entire period of pregnancy, with the exception of the last few weeks, the uterus and its vascular apparatus are in a state of tonic relaxation, because of the inhibition of the sympathetic (hypogastric) nerves, and of the adrenaline output, by the incretions of the corpus luteum (first) and the placenta (later) This physiologic state remains undisturbed during the entire period of pregnancy, even

in the face of physical trauma associated with intra-abdominal operations performed during this period, such as removal of twisted pedunculated fibroids, ovarian cysts with twisted pedicle, appendectomies, cholecytectomies and other operation of an urgent nature And the main reason why the physiologic state in the generative sphere is so seldom interfered with by these apparently gross insults, is because we have no opposingly directed impulses But how contrary the conditions are in the case of psychic shock The primitive instincts for the maintenance of life and its protection in the case of approaching danger, find expression in the lower animals in flight and escape from the impending catastrophe. This physical phenomenon is associated with an increased output of adrenaline, a stimulation of the sympathetic motor fibres, a contraction of the peripheral blood vessels (as observed in human beings by the palor of the skin), and the transfer of blood from the surface to the more vital centers which are called into maximum activity under such conditions. During the play of these forces in the rest of the body the generative sphere, the pregnant uterus, remains or still is, in its flaccid hyperemic state, which is essential for the continuation of the preg-We thus have a state of opposingly nancy directed impulses resulting in opposing and contrary effects. The blood from the surface and other parts of the body, driven to the interior during fright, danger, etc., on reaching the atonic uterus with its blood vessels already filled to capacity, causes the latter (particularly the retroplacental) to break, a retroplacental hemorrhage follows, and a premature seperation from the uterine attachment takes place

2 Psychically Caused Intermensirual or Continuous Uterme Bleeding Some normally menstruating women after having entered matrinonial partnership, begin to suffer from polymenorrhea or metrorrhagia Oft repeated curettages, and even exploratory laparotomies fail to reveal the cause, or establish a cure After a painstaking and searching anamnesis it is disclosed that the consumation of such a marriage was loveless but convenient. How do the emotional reactions of the unhappily mated woman produce physiologic disturbances in an otherwise histologically normal uterus?

The unhappily married woman dreads the fulfilment of her sexual duties, and any thought or intimation referrible to the undesired sexual congress fills her with horror and fear. Her conscious and reasoning centers admonish against physical resistance, but she cannot displace her primitive instincts of defense, against the undesired amours of her husband, into the subconscious. As a result of these antagonistic

tween these two types of ovarian cancer and the endometrium?

Since the endometrial proliferation noted in the pregravid or premenstrual phases is a direct response to the hormones elaborated by the parenchymatous or generative parts of the ovary, it stands to reason, that whenever this structural element undergoes a quantitative increase, its functional capacity is also augmented, resulting in an hyperplasia of the uterine mucosa, an increase in its vascularity, and an associated menorrhagia or metror-In primary cancer of the ovary we find a practical verification of these theoretical precepts In secondary ovarian cancer this phenomenon is wanting The following cases are exemplary

M K, age 59, para three, and one abortion menses began at fourteen, three to four weekly in type, and of two to three days duration, moderate in amount The last regular period in Nov 1913. For the past seven years is suffering from irregular profuse bleeding Physical examination—Multiple fibroids of uterus, and a left ovarian tumor. Operated upon Dec 1, 1920, panfindings-Fibromyomata Microscopic hysterectomy uters and folloculoid cancer of the left ovary Comment-Under normal conditions, fibroids of the uterus after the onset of the menopause are not associated with metorrhagia, for with the cessation of ovarian function the fibroids involute together with the uterus. In this case the menopause did not set in although the patient has reached the age of 59, because she had a primary cancer of the ovary in which the granulosa cells were prom-inently active, hence the prolonged and excessive elaboration of ovarian hormone, with the consequent excessive and unregulated uterine bleeding

D F, age 30, para four, the last child eight months ago Menses were normal up to her last conception Was admitted to the Beth Moses Hospital May 6, 1923, complaining of discomfort in the lower abdomen, and of a palpable tumor mass Preoperative diagnosis— Bilateral solid ovarin tumors Operation—Pan-histerec-tomy Microscopic findings—Solid carcinoma of both ovaries, every lymph space was packed with cancer cells No trace of the generative element was to be seen, excepting the corpus luteum of the last pregnancy, which was also invaded by cancer nests Comment-There was no metrorrhagia in this case, the generative element was not the source of the carcinomatous metaplasia, and while it may be argued that the corpus luteum of the last pregnancy, remnants of which were still present, may have been responsible for the amenorrhea, this argument would hold, if this patient had nursed her infant. In this case the mother did not nurse the child, and under normal conditions ovulation should have returned failed to reestablish itself because the invading cancer has completely destroyed the generative element, hence a persisting amenorrhea

B PSYCHOGENIC UTERINE BLEEDING

While the introduction of psychopathology into the realm of gynecology by Liepmann, Mathes, Sellheim, Walthard and others, the pathogenesis of many hitherto misunderstood and misinterpreted disorders in the sexual life of women, and in their organs of generation, was placed on a scientific basis Before proceeding with the consideration of uterine bleeding due to psychic reactions, it is desirable to pass in brief review some of the

basic principles of this branch of knowledge.

All of us react subconsciously or consciously to the material and the spiriutal forces in our environment by means of afferent sensory and efferent motor nerve fibres of the vegetative and the cerebro spinal nervous systems. These reactions may be registered in the lower nerve centers only, and remain as primitive or subconscious sensations, or they may be relayed to the centers in the neencephalon, and thus come under the dominance of the intellect and become conscious sensations. Due also to the anatomical association between the different nerve tracts, it is possible for a single afferent impulse to call forth several efferent responses

The two main objects of all reactions of living matter to its surroundings are maintenance of life, and (b) the propagation of the species Animals not endowed with a forebrain pursue these vital primitive instincts in a mild or ferocious manner, according to the strength of the urge, or according to the susceptibility of the subject to the urge. The human species endowed with a thinking apparatus, and through centuries of training in social laws, has learned to attain these primitive ends in a sublimated form He curbs and directs his primitive urges and desires along so-called proper lines of action and behavior, in a degree commensurate with his intellectuality and the level of his milieu

The intensity of our emotional reactions to pleasant and painful sensations varies with the nature of our affectivity Persons who fit in properly into the complicated and intricate mosaic of life, can displace most of their psychic reactions into the subconscious in such a way that they are almost forgotten however, a psychic reaction becomes a conscious sensation every time that a condition, suggestion or inference related in some way to the primary cause of that particular reaction presents itself, and when this conscious sensation keeps on repeating itself with increasing intensity, then the original psychic reaction becomes a psychic trauma

Another effect of oft repeated symptomcomplexes is the calling forth of reactions which are out of proportion to the primary urge, or the reaction may be altogether of an opposing As a result of these disproporcharacter tioned and contrary reactions there arises within us an "inner struggle"

In all cultured individuals the phylogenetically older psychic impulses, which are stored in the palaencephalon are in conflict with the phylogenetically younger and culturally higher psychic inhibitors and regulators, which are registered in the neencephalon Consequently, the personality of a civilized individual becomes the stock exchange in which all the nuantes of his being, which determine his at-

NERVOUS AND MENTAL SYMPTOMS IN DISEASES OF THE BLOOD*

(From a Study of 141 Cases)

By JOSHUA H LEINER, M.D, NEW YORK, N Y

A CONSIDERABLE amount of interest has recently arisen in diseases of the blood, since the work of Minot and Murphy, in liver feeding therapy in Pernicious Anemia, which followed the experimental investigations of Robscheit, Robbins and Whipple ²

This communication is based on a study of 141 case records, a number of which came under my personal attention, and observation. This material was taken from Lebanon, Montefiore and Ford-

ham Hospitals

Data will be presented on seventy cases of Pernicious Anemia—27 cases of Leukemia, 40 cases of Hodgkin's Disease, and 4 cases of polycythemia

From a clinical standpoint this material is interesting and instructive because two of the institutions are acute hospitals and one institution (Montefiore Hosp) is for the treatment of sub-acute and chronic cases, where observation and study is made over a considerable period of time

While numerous investigators and clinicians have given us a clear classification and differentiation in the blood dyscrasias, there is no unanimity as to their etiology. Are the blood changes due to endotoxic material engendered by faulty metabolism, vegetative, pluriglandular imbalance, vitamine deficiency, bacterial, or is the mechanism for the production or destruction of the hematopoetic system at fault?

Pernicious Anemia (48 females and 15 males)

It is unnecessary for me to go into any details concerning this disease except to remind you that the outstanding symptoms are anemia, achylia and

eventually combined degeneration, etc

There are individuals, as well as families, who are afflicted with constitutional achylia gatrica. This accounts probably for the familial occurrence of Pernicious Anemia, as reported by Hurst,³ and other observers as Curschman⁴ and Liepelt ⁵ Hurst believes, because of the achylia, streptococcus infections of the gums and tongue are likely to lead to intestinal infection with subsequent development of Pernicious Anemia, combined degeneration, or both. In other words—a vegetative imbalance

Skoog's view is more explicit and direct. He believes that the vegetative nervous system is at fault. The work of Minot and Murphy points more to a vitamin deficiency or other agent as an etiologic factor which in a broad sense, one can say, is a metabolic imbalance.

General Symptoms—The symptoms manifested will be divided into subjective and objective The

one outstanding complaint is weakness—asthenia upon exertion of a progressive type, this antidates in a great majority of cases any other symptom Fifty to seventy-five per cent showed this in their incipiency

Gastro-Intestinal—The second symptom, mostly spoken of is either epigastric distress diarrhoea, vomitting with anorexia. In one series, this was shown to be 25 per cent and in another 33½ per cent. Other subjective symptoms are dyspnoea, vertigo, cardiac palpitation and ringing in ears, in the order of their frequency.

Objective Symptoms—Pallor was not manifested very early, in fact in some cases it came on

rather late

Bleeding—In one form or another was present In one series it was as high as 20 per cent, either in the form of epistaxes, hemoptysis, hematameses, or bleeding hemorrhoids

Glossitis—This was not a prominent symptom, occurring only in two cases, as far as the records

reveal

Laboratory Findings—Achlorhydria was manifest in 100 per cent of the cases when gastric analyses was done. It was not done in all cases because of certain conditions being present, as myocardial disease or advanced arterio-sclerotic disease. It was a constant finding, so that in didactic teaching one can speak of the outstanding symptom as of the three "A's," Anemia, Asthenia and Achlorhydria.

Hyperglycenna—Increase of blood sugar was found. In a series of fifteen cases, where six were examined for blood sugar four showed hyperglycemia, being 122, 163, 188 and 203 milligrams. Taking it all in all, it was present in about 60 per cent of the cases.

Neurological Phenomena—A subjective complaint of great importance are the paresthesias I agree with Dr Keschner,7 that there is no other clinical condition that involves to such an extent the hands and feet giving the patient the sensation of either tingling, sticking, needles and pins, numbness or burning Waltman⁸ relates patient asking her daughter repeatedly to remove the glass slivers imbedded in her fingers 25 per cent showed this as an early manifestation One had severe cramps in the calves of the leg which could not be relieved except by morphine Objectively the peripheral sensory disturbances manifest themselves in hyperalgesic areas in arms and legs, and one case showed marked hyperesthetic nerve trunks While on this topic, I would like to speak of what Monne first called our attention to, viz, neurological symptoms preceding the blood picture Two personally observed cases (one at Lebanon and one at Fordham), showed

^{*} Read before Bronx County Medical Society October, 1927

urges an inner struggle arises, and subconsciously a defense mechanism is evolved, which in such a case takes on the form of "an escape into disease" She begins to menstruate too frequently or has irregular uterine bleeding, this incapacity makes it possible for her to avoid sexual intercourse, without arousing the suspicion of her aversion for her husband What is the psycho-physical basis of this symptomcomplex? The psychic state of a woman living under the above described marital conditions is one of constant fear and apprehension of her duties as a wife, her vegetative nervous system is in a state of sympathi-Any idea suggestion her allusion to nuptial relations is sufficient to heighten the state of her sympathetic innevration, which leads to a hyperadrenal function and vasoconstruction of the peripheral blood vessels uterus on the other hand together with the rest of the generative organs are keeping themselves ready most of the time for the fulfilment of their primitive function, the propagation of the species, and are most of the time in a state of vagotonia or relaxation and hyperemia. As a result of these opposing and antagonistic physical states, brought about by the inner psychic struggle, the blood from the periphery is easily displaced to the interior, and when it reaches the already overfilled blood vessels of the uterine mucosa, it causes the latter to rupture, and a premature, too frequent, or continuous bleeding from the uterus takes place The more labile the psychic state the more readily and easily can this symptomcomplex be enacted and repeated

If however, in the course of time such subjects can displace their conscious and painful sensations into the subconscious, in such a manner that they will not come to the level of the conscious with ease and rapidity, whenever an allusion or reference to the primary cause of the psychic trauma is made, due perhaps to the final triumph of intellect over instinct, then this symptomcomplex will disappear

Walthard called our attention to the fact, that a positive differential diagnosis between psychic and oophorogenic or uterogenic uterine bleeding rests upon the therapeutic results obtained operatively. In the psychic type operative procedures are futile, while in the organic forms of uterine bleeding they are effective

3 Psychically Caused Preoperative Uterine bleeding An unexpected onset of uterine bleeding on the day set for operation occurs from time to time in patients whose menstrual cycles are otherwise normal. What is the pathogenesis of this type of uterine bleeding?

The higher centers, the intellect and understanding dictate the submission to the needed operation, but the primitive instinct for the preservation of life and its maintenance, calls forth dread and fear of the risks entailed in the surgical procedure This ambivalency and desire to escape from this situation, create subconsciously a defense mechanism, "a refuge into disease" Such a patient will begin to menstruate or bleed from her uterus out of time and place, without being able to account for it, and at the same time experiences a secret inner gratification with its onset, for having learned from others that gynecologists usually postpone operating during the menstrual period (in elective cases), she hopes thereby to escape temporarily at least, the planned The psycho-pathological mechanism involved in the production of this symptomcomplex does not differ from the one described in the psychically produced uterine bleeding in the unhappily mated female, and needs no repetition

Since learning the cause of these psychically produced preoperative uterine bleedings, I stopped following tradition, and proceed with my operative schedule as planned, thus far I have had no reason to abandon this plan

Summary

Time does not permit the consideration of other gynecic disorders which are the result of ovarian dysfunctions and abnormal psychic reactions. I believe, however, that even the present incomplete presentation of the subject suffices to show that the pathogenesis of many types of uterine bleeding resides outside the uterine body, and beyond the confines of cellular pathology.

It is an undeniable fact that cellular pathology is the foundation rock of scientific medicine, but the progress of medicine and science in general demands that we enrich the specialty of gynecology by the knowledge gained in other fields

The modern gynecologist in order to serve well, must extend the horizon of his activities beyond the removal of benign or malignant tumors of the generative tract, or the salvaging of unaffected remnants left by the ravages of Nisserian, tubercular, or postpartum infections, or the repair of injuries of the generative tract sustained during parturition modern gynecologist must go further, he must be trained to recognize functional disturbances as readily as he does organic abnormalities, and from time to time invade the field of the psychologist, for the well being of woman depends as much upon a normal trend of her thoughts as upon a physiologic functioning of the rest of her body Her symphonic attunement to life as a whole depends upon a proper and balanced interplaying of her psyche and her physique

tions can infiltrate the cerebro-spinal system, and lower extremities affected, three of which retoxic products give peripheral nerve pictures Bass¹o reported six cases in children with neuro-pathologic findings at P M

Subjectively, three cases had pains in both lower extremities. One suffered excruciating pain in both heels, while another had such severe pain behind the ear, that it was diagnosed as acute mastered involvement. In one series of cases two out of sixteen showed mild cortico-spinal symptoms.

Duration of Life—One young man of 24 years fell and struck his leg, developing increasing pain. The blood revealed an acute leukemia and he died within five weeks. Another lad of 13 died within ten days, following the withdrawal of a tooth and continued to bleed. Another died within a month. The longest time a patient lested in this series was 4½ years. There were 17 males and 15 females. The youngest was three years old, the oldest was 63.

HODGKIN'S DISEASE

(19 females and 21 males)

The symptoms complained of in this disease were mainly attributed to pressure phenomena. If it occurred in the thorax, it lead to dysphoea or dysphagia, etc. There was considerable pain referred to the large joints. One of the outstanding symptoms noted was night sweats, occurring in five cases. Three cases complained of uncontrollable itching.

Neurological Symptoms—Phenomena of a neurological character were found in fourteen These varied from slight cranial nerve involvement, mild cord symptoms, to transverse myelitis There was also found peripheral motor and sensory involvement includ-ing radicular implication. Six cases showed the vealed transverse myelitic symptoms, i.e., motor and sensory changes, level belt of hyperesthesia, atrophy, urmary and rectal incontinence, etc Three cases showed high level, 1 e, cervical transverse myelitis One of the cases of this character was personally observed and followed up at Montefiore Hospital She was a young woman of 29 years, with glandular enlargement in the cervical region, complaining of severe pain in the right shoulder which was difficult to con-Neurological examination revealed a beginning atrophy of the right shoulder girdle and forearm and involvement of the intrinsic muscles of the hand In addition there was involvement of the cervical sympathetic, with its consequent narrowing of the right palpebral fissure, pupillary myosis, etc In other words a lower brachial plexus involvement, which together with the sympathetic symptoms is called a Klumpke-Dejerine paralysis The left upper extremity showed beginning of cord pressure symptoms, referable to the pyramidal tract, i.e., a Hoffmann and Klippel-Weil The lower extremities showed, at this time, the deep reflexes as increased on the left. She was later observed by other members of the staff, and a note dated 5/21/26 states "High cervical transverse myelitis". This shows the gradual invasion or rather pressure on the cord

Duration of Life—Nine lived less than one year Eight lived less than three years, and two lived less than five years

Laboratory findings of both blood and gastric contents gave nothing of value

POLY CYTHEMIA

Of this rare blood dycrasia, four cases were found. Two were of the classical Vaquez-Osler type, the other two showed a relative polycythemia, which may have been due to hemorrhage because of the higher concentration of erythrocytes.

These two patients were both females of 66 years and both had hemorrhages from the uterus which could not be controlled

The other two cases—Polycythemia Vera—one occurred in a man and the other case in a woman. The early subjective symptoms were dyspnoea, headache and throbbing pain in right side of chest.

Neurolgical Findings—One case showed unequal pupils L)R, and the retina showed slight tortuous blood vessels

The other case was a male patient, 49 years old The left eye showed poor convergence. There was also ptosis of this eye-lid (congenital) Nystagmus on lateral fixation Right Bell's palsey later. The right abdominal reflex was absent Sensory examination showed absence of vibratory sense in lower extremities. Mental examination showed that he was not well orientated and emotionally unstable, showing uncontrollable crying and laughter.

Duration of Life—Both (as far as I know) are still living. One has the condition 15 years and the other 16 years. Life therefore does not seem to be affected very much

SUMMARY

Pernicious Anemir—There were neurological symptoms in 78 per cent of the cases. In a smaller series of 30 cases which were followed up for years, 28 showed some neurological involvement, fifteen of which had either posterior or lateral column implication, ten of which showed only pyramidal and one case showed posterior column signs alone. Out of 45, five cases showed mental symptoms

Leukemaa—Out of 27 cases seven showed nervous symptoms, five of which gave neurotic symptoms and two mild pyramidal tracy phenomena

Hodgkm's Disease—Fourteen showed neurological symptoms, six with transverse myelitis, three lower and three high cervical cord

Polycythemia-Two symptomatic Two show-

early loss of vibratory sense and posture so that a diagnosis was made in one, nine months before Permicious Anemia was shown in the blood

Out of seventy cases, forty-five showed some form of neurological involvement, either of the peripheral nerve, the spinal cord, the cerebrum, mental symptoms or a combination of all. In Montefiore Hospital—out of thirty-six cases, twenty-eight showed neurological involvement, 1e, 78 per cent. Woltman of the Mayo Clinic found 80 per cent.

Fifteen cases out of twenty-eight, ie, more than 50 per cent showed symptoms of either posterior or lateral column degeneration mean, involvement of vibratory or postural sense, ataxis, or Cortico-spinal symptoms showing Babınskı or comfirmatories Ten cases showed only pyramidal tract implication, ie, hyperreflexia, Babinski, Oppenheim, etc One case showed symptoms of posterior column involvement alone, ie e, loss of vibratory sense, knee jerk, ankle jerk, diminution, etc Five cases out of forty-five showed mental symptoms They manifested various phases as apathy, lack of attention or cooperation-up to manic symptoms One female patient of 65 had a "sweet disposition" writer referring to these patients as being "too good"

Pathology—The groundwork for our conception of the histopathology was first shown by Lichtheim in 1886. He showed the relationship of Pernicious Anemia to posterior-lateral column degeneration—a beginning funicular myelitis, i.e., small plaques of degeneration not only around blood vessels that coalesced into larger plaques of degeneration, but also some of the larger pyramidal cells degenerate. This gives additional evidence that lymph stases is an important factor in the production of these foci

It is generally recognized that the anemia is not the cause of the neurological symptoms, because neurological symptoms often occur before the anemia, and then again it seldom, if ever, occurs in true anemia of the secondary type. It is believed therefore, that one toxin is responsible for both anemia and cord changes

Neurological changes not only occur in the cord, but in the brain as well Barett^o found typical Lichtheim foci in the brain similar to those found in the cord, i.e., cell degeneration that gives rise to secondary degeneration of the white medullated fibres, with consequent glia reaction and blood The long white association vessel wall changes as well as the short commissural tracts are affect-These changes resemble those seen in other chronic intoxications or in chronic alcoholism The internal capsule and pons have been found affected but to a lesser extent as compared to the cord and the rest of the brain While the brain shows pathologic changes and gives rise to mental symptoms, they are not due to the foci of degeneration entirely While some believe it is due to

toxic origin, one should be broad in his views and consider the mental changes as a symptomatic psychosis on toxic-organic basis, which view is held by Lurie

Diseases that Precede or Complicate Permicious Anemia—Two cases followed influenza, three had Lues, six cases followed abdominal operations, two had malignancy, one occurred after erysipelas, tuberculosis and diabetes. One man of seventy had pneumonia from which he recovered He was told that he had Pernicious Anemia, when it was discovered during a routine blood examination. A number had sore throats preceding the onset.

Longevity of Cases of Pernicious Anemia— This varies from four months to seven and onehalf years, in one series

4 cases lived less than one year (6 to 9

months)

7 cases lasted from 1 to 2 years

6 cases lasted from 2 to 4 years 4 cases lasted from 4 to 7½ years

In another series, 1 e, in an acute hospital

2 cases lasted up to 2 months

1 case died in 6 months

2 cases died in one year

Five cases therefore, out of 15 died within a year

LEUKEMIA

There are twenty-seven cases under this caption which can be subdivided into five acute and ten chronic lymphatic leukemia, and three acute and nine chronic myelogenous leukemia

General Symptoms—The incipient complaints are dyspnoea, vertigo and weakness Five cases complained of abdominal pain as a prominent sub-Eight cases complained of jective symptom bleeding in one form or another. Three gave a history of nose bleeding, two from the gums Others had hematomeses, hemoptyses and one rectal bleeding (operation done) Swelling m one place or another was a prominent symptom One began with severe pain in arm, another with a large gland in the neck, while one began with pain in both legs In going over the records it was found that the examination of gastric contents by the internist was not found important in this disease, but in four cases where it was done, an absence of free HCL acid was found. In the blood high normal sugar and hyperglycemia are Out of ten cases where it was investigated, five showed increased sugar ranging from 125 to 156 millegrams

Neurological Findings—These were not as prominent as in Pernicious Anemia, as far as these cases go I am aware of the literature on the subject which shows pathological disease pictures often running parallel to Pernicious Anemia The internist is interested mainly in the blood picture, his mental viewpoint being myopic, forgetting that in all probability the causative toxin or factor can involve other tissues, and that leukemic infiltra-

On examination she appeared pale and

drawn, nervous and chronically ill

Physical examination was absolutely negative except for tachycardia (pulse was 100), blood pressure 240/120, weight 150 pounds Urinalysis—Ft trace of sugar otherwise negative Blood-count Reds, 3,030,000 Hb 65 per cent Blood-Chemistry (Starvation) Sugar 190 mgms per 100 c c Urea 30

A diagnosis of Diabetes Mellitus with Hy-

pertension was made

She was placed on a weighed diet (saltfree) of Prot 70, Cho 70 and 1,400 Calories (Allen method was used) This woman was under active observation for 8 months and was discharged December 16, 1927, in good condition with relief of all symptoms on a diet (salt-free) of Prot 70, Cho 80 and 1,800 Calories, and a Blood-Sugar of 136 mgms per 100 c c 2 hours after a meal, B/P, 160/100, weight 151 pounds During her treatment blood-sugars ranged from 123 to 136 before and after meals No insulin was used

Case No 2 J A, female, white, married, age 31 years Seen for the first time 11/26/27

Previous medical and surgical history negative Has 2 children alive and well Family

history irrelevant

Present History—About March, 1927, patient found her appetite failing and she developed a distaste for food. After treatment for "Indigestion" she did not improve and suffered a great deal from belching of gas and vague pains in the stomach after eating. She was treated for 8 months and was finally advised to be operated on for gall-stones. She presented herself for relief of symptoms complaining of

1 Loss of appetite and distress after meals 2 Loss of weight. 20 pounds in 8 months

3 Dizzy spells and headaches

4 General weakness and mability to attend

to her duties
Physical Examination—NEGATIVE Weight
111½ pounds Urinalysis—Heavy sugar otherwise negative Blood-Sugar 326 mgms per
100 c c (Starvation) A diagnosis of Diabetes

Mellitus was made

She was put on a calculated diet of Prot 60, Cho 60 and 1,200 Calories without insulin After 6 weeks' active treatment she was discharged on a diet of Prot 80, Cho 80 and 1 500 Calories with a blood-sugar of 099 mgms per 100 c c and complete relief of symptoms. She now weighs 108 pounds and is able to attend to her duties. During her treatment her blood-sugars were not above 130 mgms per 100 c c

Case No 3 M S female, white married 56 years of age Had 5 children, all alive and well Family History irrelevant

Present History—In the late fall of 1926 patient sought relief for a uterine disturbance

with irregular bleeding. After several months of treatment this condition improved, but she complained of gastric distress and loss of appetite. She received tonic treatment and was told her stomach trouble was reflex from the disturbed uterus. She subsequently developed red patches on her hands and felt very sick after meals. Medication and diet regulation gave her no relief, and she became very weak with complete loss of appetite and suffered great distress when she did eat. She presented herself for relief of symptoms complaining of

1 Loss of appetite and distress after eating

2 Thirst and polyuria

3 Loss of weight (did not know how much, thought 15 pounds)

4 General weakness and dizzy spells

Physical Liamination — Negative, except that she appeared pale and chronically ill. She refused vaginal examination because of indisposition. Between her fingers there appeared pink irregular, dry exematous patches covered with fine scales.

Urmalysis — Heavy sugar, no acetoñe and otherwise negative

Blood-Sugar Determination 1½ hours after meal of toast and tea was 500 mgms per 100 c c A diagnosis of Diabetes Mellitus was made

Bearing in mind the possibility of impending acidosis despite negative acetone in the urine or blood, the patient was put to bed and fluids ordered with enemata for bowel relief and 100 gms of carbohydrate ordered in the form of fruit juices in divided feedings No insulin was administered and her treatment was guided by urine samples collected at 7 am, 11 am and 4 pm For 2 days she ran heavy sugar but showed no acetone She felt better the third day she showed only traces of sugar and was sugar-free on the next day The following day her diet was changed to Prot Cho 80 and no fat with plenty of fluids felt better and insisted on getting up and around On October 1st she was placed on Prot 60, Cho 80 and 800 Calories A blood-Sgr 2 hours after supper was 214 She had lost 7 pounds On October 8th a Bd-Sgr was 138 before breakfast On the 12th of October her diet was raised to Prot 60, Cho 60 and 1200 Calories A Bd-Sgr on the 15th was 143 mgms 2 hours after supper She now received an increase of 20 gms in Coh On November 8th she was allowed 200 calories She was discharged feeling fine, able to do her duties with a Bd-Sgr of 107 before breakfast, her symptoms relieved and her hands entirely cleared Weight 159 lbs (She received no medication for her skin condition)

This case I believe is a most interesting one and responded beautifully to the *Allen* type of pre-insulin day treatment

Case No 4 Wm B, male, white, married, 35

ed neurologically cranial nerve involvement, mild pyramidal tract and also mental symptoms

ROUTINE BLOODSUGAR DETERMINATION AS AN AID IN DIAGNOSIS

(With a Résumé of Five Cases)

By CHARLES M LEVIN, MD, RICHMOND HILL, N Y

ullet N this paper it is my purpose to establish the fact that Blood-Sugar Determination as a routine procedure is of great value as an aid in diagnosis and is justifiable as a clinical diagnostic measure

In these days of highly specialized endeavor and endless research a great deal has appeared in the literature about the completeness of our physical, clinical examinations as well as laboratory tests, and with practically unlimited facilities for diagnosis, we are most anxious to X-ray, fluoroscope, do basal metabolism tests, operate and explore and the like in our desire to arrive at as near a perfect diagnosis as possible, to relieve symptoms and wherever possible to affect a cure Yet at times we seem to hesitate to include a blood-sugar determination as a routine measure in our examination

In a series of 150 cases in which routine Blood-Sugars were done, a few interesting facts were brought to light. All of them had complaints of six months or longer duration All of these cases presented themselves for relief of symptoms pertaining to functional and general constitutional disturbances They all previously had had urinalyses done (all negative) among various other diagnostic measures, but none had ever had a Blood-Sugar Determination

The results of the Blood-Sugars in these cases were as follows

72 patients had sugars ranging from 083 to 130 mgms per 100 c c

47 ranged from 130 to 160 mgms per 100 c c 17 ranged from 160 to 200 mgms per 100 c c

11 were above 200

1 had a sugar of 326 1 had a sugar of 500

1 had a sugar of 750 (This case, a very unusual case, is described in a previous article)*

* Unusual Case of Diabetic Acidosis Without Ketonuria or Ketonemia B3 A Rudy M D and C M Levin, M D N Y State Journal of Medicine Nov 15 1927

All these determinations were done on starvation in AM or at least 5 hours after the last meal They all had urine samples taken at the time the blood was drawn and in only 8 samples sugar appeared In 5 there was only a faint trace present, in the case with the 326 sugar, a moderate amount appeared in the urine and in the cases with the 500 and 750 a heavy sugar was present Of the 78 cases whose sugars ranged above 130 mgms per 100 c.c., after observation and check-up 23 proved to be true cases of diabetes Mellitus

A review of 5 of these latter cases is of unusual interest because of the important role the blood-sugar determination played in the diagnosis

Case No 1 SS, female, widow, white, age 64 years Seen for the first time 3/23/27

Previous medical and Surgical history nega-Had 2 children, both alive and well Family history irrelevant

Present History - About December, 1926, patient noticed herself becoming very nervous and irritable and was unable to sleep began to lose weight rapidly although her appetite was excellent and she never suffered any gastric distress, her bowels moved regularly

She sought medical advice and was treated for nervousness About three weeks later she sought further relief and was thoroughly examined (X-ray, Blood-count and Urinalysis ıncluded) A diagnosis of Carcinoma of the intestine with severe secondary anaemia was made

She became progressively worse and presented herself for relief of symptoms, complaining of

- 1 Rapid loss of weight-lost 50 pounds in 4 months
 - 2 Extreme nervousness and irritability
 - 3 Thirst and frequent urination 4 General weakness and debility

THE PRACTICING PHYSICIAN IN COURT By HENRY C COE, MD, NEW YORK, N Y

Ittle amusement the article with this title in the issue of August 15th, by Dr L Howard Moss, and sympathize deeply with the troubles of his imaginary doctor, for "we have been there," sometimes summoned by a subpoena, more often as a so-called expert. At this time, when the jury-system is under discussion, we note that the lay press has placed an unerring finger upon the reason why there is such a wide-spread attempt on the part of busy men to evade their duty in regard to serving on the jury, because of the waste of time under which they chafe

There is no doubt that there is a growing distrust of the administration of law in New York City, in fact we share in that feeling, though taught by many years in the army to respect authority, as well as civil law. We would prefer to be tried before a bench of judges rather than by a so-called "jury of one's peers," for they are not our peers under the present system.

A saving sense of humor has always prevented us from being offended, or even annoyed, by the rude treatment of some cross-questioners, realizing as we must, after long experience with them, that they often badger us purely for effect On more than one occasion after a savage attack by a district attorney, we have gone out to lunch with him and found him not so formidable as he appeared in Court

In both criminal and civil cases the well-informed doctor (and no one should go into court without being fully instructed as to his rights) should remember always that the dignity of his profession should make himself respected by judge, jury and attorney In one criminal case in which we had previously had a frank talk beforehand with the district attorney and thought that we had convinced him that we knew nothing whatever about the matter, we wasted an entire day in court and were told that we would be called again the next day. We informed him that we would disregard a second subpoena The attorney blustered and threatened to have us punished for "contempt of court" (whatever that is), but we heard nothing more from him a medical expert we have always taken an evil pleasure in exposing the opposing counsel's ig-

norance of our specialty Lawyers, even the most eminent, are notoriously superficial in this respect and we have them at a disadvantage Even when we have coached them beforehand. they get sadly muddled in their anatomy years ago we served on a committee of three experts to combine with a similar committee from the Bar Association to draft a plan by which the testimony of medical experts could be placed on a firm basis The author's plan, worked out after long study of medical jurisprudence, was flatly rejected by our brothers in the law as "opposed to the constitutional rights of the individual" that well-worn phrase It was claimed that the plaintiff, or defendant, had a right to choose his, or her, own doctor to qualify as an expert. whether he knew anything about the subject or

Hypothetical questions are not so formidable after all and doctors have a right to refuse to answer yes or no if they are so framed as to omit, or to qualify, the crux of the matter

We have found invariably that a direct appeal to the judge, whatever his knowledge of medical jurisprudence may, or may not be, on the part of an harassed medical witness rarely fails to bring a prompt and favorable intervention. It is certainly the case in the Federal Courts Judges are usually "human" and recognize when a doctor is anxious to tell "the truth, the whole truth, and nothing but the truth," without fear or favor. The old saying that hars are divided into three classes, "hars, d-d hars and medical experts," should not be true in this progressive age.

To keep one's temper, to give one's testimony in simple language which the most ignorant member of the jury can understand, to make it absolutely clear that he is strictly loyal to his oath—is not that the secret of impressing one's testimony upon the court? The lawyers do not wish the whole truth, but only so much of it as helps their case. We carry our own "respect" to the witness-stand, whether general practitioner or specialist, and in the end we deserve just what we receive, as we do in the practice of medicine. There need be no clashing between our two professions "Duty, honor, country"—the West Point tradition—is not that motto applicable to us as to every loyal American citizen?

years of age Clerk Family History negative First seen 12/10/27

Previous History negative

Present history, dates back 6 months previously when patient began to suffer gastric attacks after eating (belching of gas and pain in pit of stomach) He continually felt tired and seemed to have lost his ambition to work. His appetite was good and his bowels moved regularly, but no matter how much rest and sleep he had, he always felt tired, and had headaches of varying severity. He was advised a diet and finally told he had Chronic Appendicitis and advised an operation would relieve him. Patient presented himself for relief of symptoms complaining of

1 Distress after eating

2 Constant weakness and tired feeling

3 Headaches and inability to do his work *Physical Examination*—Adult male, white, of pasty appearance, otherwise does not appear acutely or chronically ill Examination was entirely negative

Urinalysis negative

Blood-Sugar 209 mgms per 100 c c before breakfast

Weight 1521/2 pounds (Had not lost any

weight)

This patient was placed on a restricted carbohydrate diet with low calories. On 12/16/27 a Bld-Sgr was 142 before breakfast. On the 30th of the month a Sgr was 125 mgms 2 hours after breakfast. The patient was discharged 1/24/28, relieved of all symptoms, able to work and with a Sgr of 115 mgms before breakfast. Weight 149½ pounds

This case is of importance and interest because proper diet regulation and observation will check

a beginning Diabetes Mellitus

Case No 5 M S, female, single, white, 48 years old Occupation, Examiner in dry goods house

Previous Medical and Surgical History nega-

Present Illness, dates back to about July, '26, when she noticed a slight redness about her right ankle There was no pain or interference with function Within a few days her ankle began to blister This condition grew worse and spread over the front of the foot as well as the under surface She applied salves and used other home remedies, but did not consult a physician She continued at work however until she noticed she began to feel dull and tired and had no ambition to get about Her appetite failed her and she began to have dizzy spells after meals She pre-

sented herself for relief of symptoms complaining of

1 General Weakness and mability to work

2 Loss of appetite

3 Headaches and dizzy spells

4 "Sore right foot"

Her physical examination was negative except for her right foot. Here there was a large circumscribed ulcerative area, exuding serum and in some places pus, with patches of scales irregularly scattered over the ulcerated area. There was a definite raised outline and this ulcerated area extended anteriorly over the entire dorsum of the foot, from a line above the malleolar level down to the toes. Posteriorly it continued over the under surface of the foot and up over the heel. Medially it extended up to about 3 inches above the inner malleous. There were no varicose veins present.

Urınalysis—negative Wassermann—negative

Bld Sgr -235 mgms per 100 cc

Diagnosis — Diabetes Mellitis complicated by Exoematous infection

She was advised to go to a hospital but refused, urging treatment at home. Her treatment consisted of strictly weighed diet regulation with local and quartz-light therapy. This case was under active observation for 9 months and she was discharged on a restricted diet and 1400 calonies and a Bd-Sgr of 107 mgms per 100 cc. before breakfast. Her foot is entirely healed and she has resumed her usual work feeling fine with a weight of 119½ pounds, a loss of 32 pounds in 15 months. Her Bd-Sgr check-ups are always normal

Conclusion

Five cases are presented from a group of 150 patients upon whom Blood-Sugar Determinations were done as a routine procedure in the examination. A résumé of the cases proves that a Bd-Sgr Determination is as important as any other diagnostic measure. I feel that a Bd-Sgr Determination should be a routine measure in the clinical examination. Bd-Sgr Determination as a routine measure is justifiable in view of the recent developments as a result of research in metabolism and glandular study. A Bd-Sgr Determination is essential to a complete diagnosis and as an aid in diagnosis is of inestimable value.

I want to express my appreciation and gratitude to Miss Dorothy Umbenhaur, my associate and dietician who so splendidly and ably assisted me in the supervision and management of the

dietetic treatment of my patients

THE PUBLIC RELATIONS COMMITTEE OF A COUNTY MEDICAL SOCIETY

The Public Relations Committee of the Medical Society of the State of New York was designed to secure co-operation between societies of physicians and voluntary health organizations Its activities during the last two years have been the development of principles of action and the formation of agreements with voluntary agencies regarding their respective The co-operation of the fields of influence two classes of societies was excellent so long as the discussion was confined to principles and theoretical problems Serious difficulties arose when these principles were put to practical tests in several counties, especially Cattaraugus where the lay organizations had assumed the dominating leadership in all phases of public health work The discussions between the representatives of the State-Medical Society and the lay health workers revealed the strength of the lay organizations which occupied the field of public health and were well supplied with money and with a hired personnel to carry out their plans other hand the physicians of the county labored under the disadvantages of inexperience and unpreparedness when they attempted to assert themselves in the public health field Even the leaders of the Medical Society of the State of New York found but few precedents to guide them in formulating plans for the active participation of physicians in the practice of public health and civic medicine

The Committee on Public Relations of the State Society has made an excellent beginning, and its work during the coming year will consist largely in stimulating county societies to engage in the practice of preventive medicine. It is no secret that there have been serious differences of opinions between physicians and lay health workers regarding the methods of carrying on the work in their overlapping fields. Yet the very fact of criticizing the plans of the lay workers has laid upon the physicians the constructive duty of doing public health work better than the laymen were doing it

The great obstacle in the way of the practice of public health and civic medicine by physicians is that the practice of these specialties requires self-sacrifice with little direct returns in money or honor. While the future may develop a people who will pay for advice in preventive medicine, the fact remains that at present most persons expect to obtain that advice free and to follow it only in the presence of immediate danger. It is greatly to the honor of physicians that they are rapidly expanding the sphere of their public health work from a conscientious sense of duty rather than

from any hope of obtaining financial reward

The practice of public health and civic medicine by physicians at present is largely in the hands of medical societies in distinction from individual physicians Not every doctor is fitted by temperament and training to engage in the direct practice of public health, but every county society has one or two doctors who have the gift of public speaking, and these will address governmental organizations and lay audiences in the name of the society. One or two members will be writers who will prepare medical news items for the newspapers A physician politically inclined will influence government bodies to pass public health legislation But when the list of these specialists is exhausted there will remain the majority of physicians who have no special gift to devote to public health, yet these too can do efficient and essential service by supporting the County Society, paying their dues, giving minor service when asked, and speaking well of the ideals and practical aims of the Society

The first essential in the performance of public health wrok by a county society is a survey of the field Nearly every county society in New York already has a committee on public health, and many societies have expanded its duties to include the relations of the medical society to lay health organizations This committee needs to know which health organizations are active in the county, the names of their officers and the work that they are trying to do The members of the committee also form an intimate acquaintance of the leaders in the lay health roganizations, and ascertain their medical point of view Furthermore, the committee needs to instruct the lay leaders in the point of view of the medical profession, and inform them of the amount of public work which is already being done by family physicians When physicians and lay leaders have each acquired the other's point of view, the way is open for physicians to advise the laymen, and ultimately to assume the direction of all public health activities in the

The great work of the Public Relations Committee of the Medical Society of the State of New York during the coming year will be to stimulate the committees of the county societies to function actively, beginning with a survey of the field and the establishment of active contacts with lay workers who already are engaged in public health work. Then there will follow a gradual assumption of leadership in all public health movements by the physicians of the counties

COUNTY DEPARTMENT OF HEALTH FOR SUFFOLK COUNTY

The Board of Supervisors of Suffolk County at its regular meeting on August 27, voted unanimously to establish a County Department of Health under the provisions of section 20-b of the Public Health Law This action was the result of the quiet work of the Suffolk County Medical Society, with the assistance of Dr Matthias Nicoll, Jr, State Com-

missioner of Health, and the support of the Suffolk County Dental Society and the Suffolk County Tuberculosis and Public Health Association The medical profession of the county originated the movement and carried it to a successful conclusion A full account of the establishment of the department will appear in the next issue of this Journal

MEDICAL PROGRESS

Two Apparent Recoveries from Anesthetic Leprosy Following Protein Shock Treatment -Philip Manson-Bahr refers to the very striking improvement and remission from active leprous symptoms that have been reported from time to time with a variety of agents reports seem to justify the surmise that reagents which cause the most profound constitutional disturbances produce the best results on the more active symptoms of the disease The intravenous injection of proteins, producing a generalized systemic reaction, was apparently first employed by Hasson, who reported successful and almost instantaneous results with intravenous injections of a vaccine consisting of 15,000 million killed B pyocyaneus and 5,000 million leprosy bacilli The reactions caused by these injections appeared to be those of a severe protein shock Dyce Sharp has reported almost as favorable results from the intravenous injection of sterilized preserved milk Manson-Bahr reports two cases of anesthetic leprosy treated along these lines In the first case six intravenous injections of Hasson's vaccine, varying from ½ to 1 c.c. were administered, with intervals of not more than a week between the injections There was nothing in the reaction to distinguish it from ordinary protein shock In the second case typhoid and paratyphoid vaccine (TAB) was given, beginning with 50 million organisms and gradually increasing to 200 million killed bacilli jections were made at intervals of a week onset of the shock was considerably delayed, usually occurring in from four to twelve hours In both cases the improvement in the patient's general condition, the restoration of the destroyed tissue and the return of sensibility were too apparent to be incidental. In early lesions of anesthetic leprosy protein shock treatment is certainly worth a trial-Lancet, June 2, 1928, ccxiv, 5466

Abdominal Pain in Children Due to Enterospasm—Henry Heiman and Philip Cohen describe a type of abdominal pain in children which has received more attention on the part of pediatricians in Germany than in this country. This pain is peculiar to children from the ages of four to twelve years. It is usually referred to the umbilical region, less commonly to the right and left iliac regions, and to the epigastrium. The ingestion of food usually brings on the colic, but this may bear no relation to meals, and often the mere sight of food causes an attack. The usual symptoms are vomiting and constipation, or an urgency of defecation with anorexia. Most of the chil-

dren present a picture of vagotonia or have a pronounced neuropathic make-up Emotional factors and infection are common exciting Physical examination is negative except when during abdominal palpation a spasm occurs and a soft, cord-like mass (spastic intestine) is felt. Roentgen-ray studies are not wholly satisfactory The authors, however, were fortunate in making r-ray examinations while the patients were having attacks of enterospasm The roentgenograms showed spasm of the colon and plyorus, with hypertonicity and hyperperistalsis of the gastroenteric tract. The most effective treatment is atropine, either tincture of belladonna or 1 to 1,000 solution of atropine sulphate, a half hour before meals The condition has often been mistaken for appendicitis The term enterospasm is preferable to the German expression "Nabelkolik," as better describing the pathological physiology of the disease -Archives of Pediatrics, July, 1928, xlv, 7

Will the Malarial Treatment of Syphilis in General Supplant the Use of Drugs?-Professor Zieler of Würzburg virtually asks this question in a paper on malaria treatment as a general antisyphilitic, especially in early syphi-By this means we can certainly produce a general sterilization, but the author does not believe it indicated in cases which respond well to arsphenamine and other drugs. In the few cases which prove refractory to the latter, the malaria treatment should certainly be used The ease and rapidity of a malarial cure are evidently offset by a certain amount of risk Again if the patient develops early implication of the nervous system (recurrent meningitis) the malarial treatment is indicated, although there is no certainty that recurrence will be prevented even if both plans of treat-This may also apply ment have been used to metasyphilis The malarial treatment is of course non-specific while the drugs employed are to be classed as specifics The author suggests for neuro-recidive cases a strong course of drug treatment, to be followed by malarial inoculation The dangers of the latter are slight in young and strong patients with early syphilis, and 10 or 12 courses have been given without prejudice under these circumstances But the principle of giving a patient a serious disease in the attempt to cure another disease is evidently not sound as a routine measure It might be rejoined that there is as much risk involved in giving arsphenamine by the intensive methods, which are only allowable in

THE COMMITTEE ON THE COST OF MEDICAL CARE

The Committee on the Cost of Medical Care is the outcome of a conference between half a dozen public health workers which met first in the year 1925. Then in May, 1927, the workers arranged a conference at the time of the annual meeting of the American Medical Association in Washington, and formed a committee which received the unofficial support of the national organization. Its chairman is Dr. Ray Lyman Wilbur, past-president of the A. M. A.

The committee has forty-two members, of whom twenty-three are physicians and fourteen are classed as private practitioners of medicine New York State is represented by Dr N B Van Etten and Dr Haven Emerson The headquarters of the Committee are at 910 Seventeenth Street, N W, Washington, D C The committee receives financial support from several organizations, including the Carnegie Corporation, the Milbank Memorial Fund, and the Russell Sage Foundation. It has a budget of between sixty and seventy-five thousand dollars. The A M A will cooperate with the committee and will make some of the studies at its own expense.

The committee has adopted a program of investigation which is intensely practical. It has no objective which it seeks to justify, nor any organization to advertise, nor any movement to promote. It seeks facts regarding sickness. It will first make an examination of present conditions relating to sickness. It will then formulate

the diagnosis, and lastly, will devise and apply a remedy

One of its lines of investigation will be the income of physicians

A doctor's bill is by no means the principal item in the cost of sickness, as is commonly supposed. There are drugs to be bought, nurses to be hired, hospital bills to be paid, and often the expense of a funeral with its outward show, and the doctor is the only creditor that does not demand cash. Every physician, therefore, is vitally interested in a study of actual conditions as they exist in a variety of communities.

The scope of the work of the committee is set forth in a forty-page pamphlet, which is thrillingly written and will appeal to physicians because of the practical nature of the questions which will be asked, some of which are What diseases and conditions are responsible for disability and inefficiency? proportions of persons need medical service? What is the capital investment and income of What is the physicians in private practice? capital investment of hospitals and clinics? All these and many more similar data will be investigated by the committee and reports made from time to time

Every physician will benefit by this report, for it will not only give him a basis for the adaptation of his own economics, but will give the people generally an idea of their proper relation to the medical profession

LOOKING BACKWARD

This Journal Twenty-five Years Ago

Post-Graduate Instruction —We are accustomed to think that the physicians who went to European clinics a generation ago numbered thousands, but the following editorial from the August, 1903, JOURNAL seems to indicate that they were only a few hundred

"Every physician in active practice of eight or ten years feels the necessity of freshening up his ideas by a short course of study. Often this is preliminary to his taking up some special line of work. Up to twenty years ago it was customary to go to Paris for this instruction. In later years the bulk of those going abroad have made. Vienna or Berlin their objective point, and today there are more than a hundred American physicians in each of those cities doing post-graduate work. Scattered over Europe will be found at least 300 others busy at work. The question naturally arises,

Have we not post-graduate medical schools here in this country competent to teach these men as well, if not better, than is done abroad?

"Why should men go to the expense of a voyage of 4,000 to 5,000 miles, why should they strive to listen to a lecture, the language of which they but half understand, even after weeks and months of residence abroad, why should they sacrifice time and comfort if they can get the same thing here? It is high time that we should determine these reasons and adopt and improve on European methods in this matter. The city medical societies supply a vast amount of post-graduate instruction of a superior kind, but they are not properly appreciated. Perhaps in the future, they may successfully solve the problem of post-graduate instruction."

stage of the disease and for a sufficient afterperiod to permit healing of the recently acquired heart lesions There seems to be no reason for keeping patients in bed for months after the disappearance of signs of active in-Tonsillectomy cannot be said to have demonstrated its value as a preventive either of rheumatic heart disease or of the recurrence of acute attacks of rheumatic fever currences take place in 50 per cent of the patients whose tonsils have been removed patient's life should be regulated as regards exercise, good hygiene, and the problems of suitable occupation and marriage. In the absence of active infection exercise that is pleasurable does no harm The amount of damage which the heart has incurred and the financial, social, and intellectual status of the patient have a significant bearing upon the advice to be given in the individual case—New England Journal of Medicine, July 19, 1928, CACIN, 2

The Incretory Function of the Interstitual Cells of the Testicle—Professor E J Kraus of Prague gives a preliminary communication on this subject. Of a number of theories in more or less vogue he inclines chiefly to the trophic, although certain objections can be adduced as to its universality He is of opinion that nutriment specific for the germinal cells is stored in the interstitial cells, but must reach the former through the blood and not by con-However this may apply only to certain lower animals—the author has studied cats especially—and in general it is probable that both routes are available under various circumstances It is known that with the elimination of the hypophysis the interstitial cells undergo atrophy to a greater or less extent and in general there is some functional association of a hormonic character between the midbrain and these cells Another element to play a role in the trophic function of the cells in question is the nerve supply, for the relation between the nerve filaments and the extratesticular interstitial cells suggests that which subsists between the sympathetic nerves and the suprarenal glands Finally it is by no means certain that the increase in size seen in the cells is due solely to the storage of nutri-Many of the finds in animal experiment, as well as those in the human clinic, suggest that the cells have a double function, trophic and incretory However, there is nothing to show conclusively that these cells contain any element which is specific for maleness, for this principle is bound up in the primitive seminal cells only -Klinische Wochenschrift, July 8, 1928

Mixed Scarlet Fever and Diphtheria —Dr F von Bormann of the City Hospital for Con-

tagious Diseases at Tallinn-Reval (Esthonia) speaks of the scarlet fever cumulation of cases in 1926 and 1927, the total being 1107 of which number 162 or 146 per cent were complicated by diphtheria This material presented a clinical type of disease which was quite distinct alike from diphtheria and from scarlet fever The initial symptoms were those of coryza with more enlargement of the submaxillary glands than is commonly found in scarlet fever The appearance of the throat was of no value for diagnosis for it might indicate catarrhal angina or scarlet fever There was next a stationary period in which fever may have subsided but by the close of the first week a decided aggravation was apparent discharge became purulent and bloody, the nasal orifices raw and crusted, the lips cracked and crusted, the tongue, teeth and gums covered with an offensive and dirty coating while the throat showed mostly the picture of necrotic angina, true diphtheritic membrane being the exception The glands were now the seat of phlegmonous cellulitis resembling greatly that of Ludwig's angina The mortality which was high was cut in two in the series of cases in which both antitoxin and scarlet fever serum were used seasonably Even here, however, it was 342 per cent, and the use of either serum singly was without marked effect, although results were slightly better under anti-In regard to bacteriology the Klebs-Loeffler bacıllus was found in 75 per cent of cases studied, although in small number There is no mention of any research for hemolytic streptococci The high mortality was due partly to deaths from sepsis, bronchopneumonia and various purulent metastases great difficulty in nourishing the patients was doubtless a contributory factor for they were The cases were largely in extreme emaciation not of the type of malignant diphtheria which has prevailed in Berlin recently for here there was no suggestion of a scarlet fever component - Deutsche medizinische Wochenschrift. June 29, 1928

Treatment of Migraine—Since it is generally agreed that migraine is due in some way to a functional disorder of the vegetative nervous system, J Purdon Martin says the specific treatment involves (1) the use of drugs acting on the vegetative nervous system, (2) the giving of general nervous sedatives, and (3) the correction of ocular refractive errors. Foci of infection in the tonsils or elsewhere should receive thorough treatment. Of the drugs which act on the vegetative nervous system those most in vogue are nitroglycerin and thyroid extract, calcium lactate has also been credited with good results. Liquor trinitrini (spiritus glycerylis nitratis, U.S.P.), ½

strong subjects under 30 years of age, but this does not apply to the less intensive use of the drug with hismuth and mercury, which will doubtless continue to be our routine resources—Deutsche medizinische Wochenschrift, June 22, 1928

Is There a Sleep Center in the Region of the Third Ventricle?—Drs A Devic and G Morin refer to the thin layer of grey matter which surrounds the region of the third ventricle and the aqueduct of Sylvius which for many years has been an object of indifference to brain students Its depth has made it very difficult for the experimenter and the importance of the adjacent hypophysis has also dwarfed its significance In 1913 some work by Camus and Rousy appeared to attribute to it some of the functions which are usually regarded as belonging to the hypophysis, but this possibility is still sub judice. Even before this period there was discussed the possibility of a sleep center somewhere in the brain and the slow cumulation of many clinical and experimental data has served more and more to associate this region with the hypothetic center belong the finds incidental to lethargic encephalitis and narcolepsy Under the latter must be understood chiefly the forms symptomatic of organic brain disease, in which lesions are found in the region in question, although in certain cases of apparently idiopathic narcolepsy similar lesions have been found to reverse the order, tumors in the region of the third ventricle may manifest themselves by drowsiness, lethargy, and attacks of narco-The authors sum up the knowledge of a sleep center to date as follows. In the mesencephalon there is probably a center for the regulation of sleep Such a view does not in any way discredit the theory that sleep comes about as a result of cortical inhibition. In addition to the evidence submitted above other documents may be added, such as the results of injection of calcium in the zone in question and the action of a group of drugs known as mescncephalic hypnotics-chloral, veronal, etc. Journal de médecine de Lyon, June 20, 1928

Clinical Contribution to the Problem of Thyroxin—E A Burmeister sketches the discovery by Kendall of thyroxin and the proofs that it is the sole thyroid hormone, and the success of Harrington in the synthesis of this substance. Both the natural and synthetic forms have been extensively tested by the various routes and the actions compared with those of the older thyroid preparations. The author himself has tested two series of 15 patients each with the two forms and has found notable points of difference. Thus native thyroxin promotes divires while the synthetic form shows

no such activity. The changes in weight also show much difference, for the native form given under weekly control, practically alvays caused some reduction, either slight or marked, while the synthetic, although a fer patients showed some reduction, was often quite inert, some patients even gaining slight-Moreover the reduction under the native form was steady and progressive. These results of the authors are not the first to be published, but they fully corroborate the earlier efforts of Schittenhelm and Eisler The cause of this discrepancy will have to be sought along physiological experimental lines. The two drugs were given by the author by the mouth, as usual in all thyroid medication Since the composition of this article two other experimenters have obtained results which bear out the author fully Abelia in certain animal experiments has found native thyroxin 200 per cent more powerful than the synthetic while Zondek and Koehler found it necessary to give the latter in large and almost toxic doses to secure the results obtained by small doses of the native hormone -Münchener medızınısche Wochenschrift, June 22, 1928

The Prognosis and Treatment of Rheumatic Heart Disease -In summarizing our knowledge of these aspects of rheumatic heart disease, William D Reid states that the pingnosis of this affection depends more upon the nature of the rheumatic infection than u,ion the structural lesions in the heart rences of the active stage of the infection are common, but difficult to predict. The age of the patient appears to be an important factor Available stain determining the prognosis tistics show that the heart is involved in the initial attack in 78 per cent of patients between five and ten years of age, and in not less than 50 per cent of those less than 25 years of age Recurrences are much less frequent in patients older than 25 years at the time of the first at-The average case progresses to a fatal Convalescence termination in fifteen years from the first attack is the rule fibrillation is a common sequela after a lapse of some years There is today no specific therapy for rheumatic affections. The salicylates are efficient in relieving the exudative phenomena, such as joint pains, but not those of the proliferative type A suitable prescription is one consisting of sodium salicylate 5 drachms, potassium bicarbonate 10 drachms, and peppermint water 4 ounces. One to two ounces are taken in a half a glass of water every two to four hours until relief is obtained, then three times a day This is the adult dose The continued prescribing of salicylates after convalescence is established is open to ques-Rest in bed is indicated during the acute

The Incretory Function of the Interstitial Cells of the Testicle -- Professor E J Kraus of Prague gives a preliminary communication on this subject. Of a number of theories in more or less vogue he inclines chiefly to the trophic, although certain objections can be adduced as to its universality. He is of opinion that nutriment specific for the germinal cells is stored in the interstitial cells, but must reach the former through the blood and not by con-However this may apply only to certain lower animals—the author has studied cats especially—and in general it is probable that both routes are available under various circumstances It is known that with the elimination of the hypophysis the interstitial cells undergo atrophy to a greater or less extent and in general there is some functional association of a hormonic character between the midbrain and these cells Another element to play a role in the trophic function of the cells in question is the nerve supply, for the relation between the nerve filaments and the extratesticular interstitial cells suggests that which subsists between the sympathetic nerves and the suprarenal glands Finally it is by no means certain that the increase in size seen in the cells is due solely to the storage of nutri-Many of the finds in animal experiment, as well as those in the human clinic, suggest that the cells have a double function, trophic and incretory However, there is nothing to show conclusively that these cells contain any element which is specific for maleness, for this principle is bound up in the primitive seminal cells only -Klimsche Wochenschrift, July 8, 1928

Mixed Scarlet Fever and Diphtheria —Dr F von Bormann of the City Hospital for Con-

tagious Diseases at Tallinn-Reval (Esthonia) speaks of the scarlet fever cumulation of cases in 1926 and 1927, the total being 1107 of which number 162 or 146 per cent were complicated by diphtheria This material presented a clinical type of disease which was quite distinct alike from diphtheria and from scarlet fever The initial symptoms were those of coryza with more enlargement of the submaxillary glands than is commonly found in scarlet fever The appearance of the throat was of no value for diagnosis for it might indicate catarrhal angina or scarlet fever. There was next a stationary period in which fever may have subsided but by the close of the first week a decided aggravation was apparent discharge became purulent and bloody, the nasal orifices raw and crusted, the lips cracked and crusted, the tongue, teeth and gums covered with an offensive and dirty coating while the throat showed mostly the picture of necrotic angina, true diphtheritic membrane being the exception The glands were now the seat of phlegmonous cellulitis resembling greatly that of Ludwig's angina The mortality which was high was cut in two in the series of cases in which both antitoxin and scarlet fever serum were used seasonably Even here, however, it was 342 per cent, and the use of either serum singly was without marked effect although results were slightly better under anti-In regard to bacteriology the Klebs-Loeffler bacillus was found in 75 per cent of cases studied, although in small number There is no mention of any research for hemolytic streptococci The high mortality was due partly to deaths from sepsis, bronchopneumonia and various purulent metastases great difficulty in nourishing the patients was doubtless a contributory factor for they were The cases were largely in extreme emaciation not of the type of malignant diphtheria which has prevailed in Berlin recently for here there was no suggestion of a scarlet fever component -Deutsche medizinische Wochenschrift, June 29, 1928

Treatment of Migraine—Since it is generally agreed that migraine is due in some way to a functional disorder of the vegetative nervous system, J Purdon Martin says the specific treatment involves (1) the use of drugs acting on the vegetative nervous system, (2) the giving of general nervous sedatives, and (3) the correction of ocular refractive errors. Foci of infection in the tonsils or elsewhere should receive thorough treatment. Of the drugs which act on the vegetative nervous system those most in vogue are nitroglycerin and thyroid extract, calcium lactate has also been credited with good results. Liquor trinitrini (spiritus glycerylis nitratis, U.S.P.), ½

to 1 minim, is given over long periods, except during the actual attacks Thyroid is usually given in doses of 2 grains of the dry extract taken at bed-time Of the nervous sedatives luminal is undoubtedly the best, it is given in doses of 1 to 11/2 grains at night or 1 grain night and With the less severe types of migraine, luminal and thyroid are often sufficient without the liquor trinitrini General hygienic measures are also of great importance condition of the bowel is naturally the first care, and even though constipation is not present great benefit is derived from a morning The diet and general mode of life should be regulated according to the needs of the individual case If the prodromal symptoms are recognized, an attack may often be aborted by a dose of calomel or a Seidlitz powder and full doses of aspirin, or one of its congeners, every two or three hours Occasionally chloral or veronal may be required, and in rare cases morphine is used to enable the patient to retain nourishment in a prolonged attack —Lancet, July 14, 1928, ccxv, 5472

A New Bone Disease —A Leri and J A Livre describe as new an affection which is characterized as a hyperostosis of one member -in the case under observation the entire upper extremity of the left side, from shoulder to fingers However, not the entire breadth of the limb is involved but only a ridge resultsa linear hyperostosis The authors reported their case for the first time in 1922 and since that time six others have come to light in various parts of the world In four of these an upper limb was involved, in three others a lower limb In the latter location the line runs from pelvis to toes. In the forearm and leg only one of the two bones may be involved, or if both are involved it is at different levels Likewise only a part of the carpal and metacarpal bones are involved and only certain The process begins in the digits as a hypertrophy with much deformity, usually at about the second dentition, and progresses very slowly Nothing has as yet been elicited as to its origin and nature. Our knowledge of the histology is thus far limited to a few biopsies Owing to the absence of rontgenograms and of all illustration it is rather difficult to visualize this affection, but there seems to be no doubt that the disease is not only new but that it represents a transition between general diseases of bone-like rickets, osteomalacia and achondroplasia-and focal affections which are usually due to microorgan-There is nothing in the new affection

to suggest a parasitic origin nor is there any evidence of a congenital anomaly of growth—Bulletin de l'Académie de Médecine, June 26, 1928

The Sacroiliac Problem — C B Heald, writing in the Lancet, July 14, 1928, ccvv, 5472, discusses a group of cases of sacrolliac disability in which the following three factors were constantly present (1) A history of relatively sudden onset of pain in the back following a muscular movement of the "surprise" type, and quite insufficient to cause a dislocation of a joint the size of the sacroiliac synchondrosis, (2) inability to cough without pain and without accentuating all symptoms, (3) complete inability to lie flat on the back and lift both legs (when separated by about six inches) simultaneously off the ground with the knees fully extended Heald has come to recognize that this double-leg lifting test is important in distinguishing one group of "backache" cases from all others assistance of Prof Lucas-Keene, has has endeavored to find an anatomical theory which would explain these cases in which absence of severe trauma ruled out sacroiliac joint dis-The hypothesis which he proplacement pounds is that the original injury is a comparatively minor tear of the inner portion of the quadratus lumborum and of its anterior fascial covering, commencing from the point where it becomes continuous with the iliolumbar ligament as this stretches from the tip of the transverse process of the lumbar vertebra, almost horizontally outward to the inner lip of the iliac crest. This hypothesis covers the majority of the symptoms so well, and corresponds with the effective lines of treatment so closely, that it may be accepted as a simple working description of a controversial condi-Treatment largely depends upon the duration and severity of the symptoms, the size, age, weight, and fatty covering of the pa-In heavily built patients with severe pain and complete inability to begin doubleleg lifting, rest in bed, completely flat, with a pillow under the buttocks, is the first essential If this does not lessen the pain strapping should be put on If this fails, the strapping is removed, and with the patient anesthetized general mobilization movements are carried The patient is then treated as before for several days, when massage and passive movements are commenced. At the end of a week strapping is applied and the patient allowed to be up, provided the ability to begin double-leg lifting has returned

TRIAL BY JURY

There is probably no feature of Anglo-Salon institutions more distinctive or more characteristic of a liberty-loving race than trial by jury. This system comes to us from the very dawn of English history. It is predicated upon the belief that there resides within the breast of the ordinary man an innate sense of justice, and that in the long run, our lives, our liberty and our property are secure within the keeping of any twelve of our fellow countrymen. The system brings into the administration of justice the human touch. It alleviates the asperities and rigidities of the law through the application of what might well be called "the equity of common sense."

In this day of rapid change, when all of our institutions are in the crucible of scrutiny, it is not infrequently asserted that the jury system is a failure, and that the administration of justice could more adequately be carried on, were cases to be decided by those trained in weighing proof. It has been frequently declared that the adjudication of disputes could be more scientifically made, were a judge or a court of judges to decide both facts and law, instead of leaving factual disputes to the determination of twelve men From a long observation of the courts, and from the constant trial of cases over a period running back nearly twenty years, the writer feels constrained emphatically to dissent from the suggestions Juries do not always of these innovators render justice Yet it has been our observation that where the trial is adequately conducted by the presiding judge, incompetent or irrelevant testimony has been rigorously excluded, and the issue is left to the jury under a plain, clear charge incapable of being misunderstood, that in the long run, the verdict which the jury renders represents a fair decision and one consonant with justice in its truest sense

Men trained in the ordinary activities of life, whether they be salesmen, clerks, executives, storekeepers, businessmen, or whatever the calling which may claim them, have learned much of human nature, of human kindness and of selfishness, of the motives of self-interest, of greed and avarice, and especially they have built up an intuitive discrimination that enables them to sift out truth from falsehood, and thereby to reach a conclusion as to where

is the real fundamental right and merit of the The wisdom and the penetration with which ordinary jurors usually approach their work, is sometimes a matter of surprise to the lawyer, who feels that by his training and education he is better equipped for these things than any juror could be A lawyer has neglected much of the education available for him who has not seized upon his opportunity to discuss his case with the jurors after their verdict has been rendered,-both where he has triumphed, and where his efforts have resulted in an adverse verdict He will find from such interviews that the weaknesses of his own case have not been overlooked, nor have the flaws in the contentions of his adversary gone unnoted He will hear many shrewd observations as to why this or that witness was or was not believed. He will find that the narrative rendered from the witnessstand has been tested, not only by the observation of the witness as he testified, but by a comparison with what was or was not under all the circumstances inherently probable or The lawyer who has embraced ımprobable the opportunities afforded by such discussions will come to take a different outlook upon his future cases, and perhaps will equip himself to form a shrewder and more penetrating judgment as to the real merits of some future case He will come to see it as twelve jurors will be likely to see it when finally they retire for their deliberations in the jury room

Were the writer to be asked as to possible beneficial additions to the curricula of the law student, he would say that every man who contemplates an active career at the bar as a trial lawyer, should be compelled during at least one month of his apprenticeship to serve as a trial juror. He would thus learn much of that which is nowhere written down, for in all the legal literature there is little that will guide him as to how and in what way in actual practice a jury of twelve men will consider and decide a controversy

It is not often that a juror is as articulate as Lawrence W Rogers, whose interesting article "Gentlemen of the Jury" appeared in the Sunday supplement of the New York Herald Tribune of July 8th, 1928 Many of his reflections are worth quoting "Two points," he says, "are burned into the juror's mind

1062 LEGAL

early in the game First never go to court unless you have facts to sustain your feelings Flimsy evidence prejudices a jury against you Second, if you are going to court obtain the best counsel you can get The lawyer who is not alert and 'on to his job' has little chance when he gets in the company of those who can play all around him in court procedure An inefficient trial lawyer is, in fact, woefully out of luck unless there chances to be a member of the jury with the peculiar combination of sympathy, intelligence and personality to plead his case for him all over again when it reaches the jury room. While this sometimes happens, it is a most uncertain thing to depend upon Many just claims are undoubtedly lost by blunders, together with failure to detect and seize upon the proverbial psychological moment."

An interesting, if rather sobering sidelight on the way in which expert testimony is sometimes regarded is thus referred to by Mr "In one damage suit, two profes-Rogers sional witnesses, a bone specialist and an x-ray specialist took an armful of human spines and x-ray plates and proved the plaintiff had an incurable disease that could have come from only the accident named The defendant then put on the stand two similar specialists, who both declared the x-ray plates to show no diseased condition and insisted that in any event the disease could not possibly have been caused by the accident in question 'Some of these professional witnesses do take the cake,' impatiently remarked one of the jurors when the case had finally reached us after three dry, tedious days 'What ghost of a show have we, anyhow? The question for us to settle is, who lies?' 'I think they are full of banana oil,' spoke up another, 'and I suggest that we kick their evidence out and stick to the point of whether or not there was negligence on the part of the railroad' 'Second the motion' shouted the crowd, and the case was decided on the non-professional evidence"

The importance of conservative and of truthful statements in court, both by litigant and counsel, is further emphasized in this article "An extravagant first statement," says Mr Rogers, "unless substantiated with convincing evidence, will live to damn the lawyer or client who makes it Some juror is sure to bring it up and prejudice the whole case A girl had been knocked down and trampled by a crowding mob on a flight of stairs leading from an upper to a lower station level and had brought suit against the transit company been hurt and seemed sincere, the jurors were deeply moved 'We agree that the girl is injured,' said the defendant lawyer, an ingratiating fellow visibly touched, 'but it is one of those tough things of life Crowds are

everywhere, and you cannot stop them People will push and shove in spite of all you can do We feel that we cannot be held liable, as we are doing everything humanly possible to meet congested traffic conditions' This latter statement caused trouble When brought up in the jury room it opened a train of discussion that led the jury to conclude that the transit company positively was not doing 'everything humanly possible to meet congested traffic conditions' With this claim punctured, it was a quick sequence to the belief that there should have been a guard at the head of the stairs to direct traffic properly and a verdict for cash damages was reached"

An interesting observation for the trial lawyer, expressing a truth which the writer has often emphasized, was contained in this article in these words "In the long run, I have observed, jurors prefer the lawyer who respects the court and opposing counsel and who can present his facts in a simple, clear-cut manner and keep hammering them home until they get under the skin. They love the fellow who is a good sportsman and who "knows his onions"."

A previously unwritten chapter of what occurs in the jury room, of how jurors actually reach their determination, and how the recalcitrant or unreasonable members are sometimes overborne, is here given "A contrary streak in human nature," writes Mr Rogers "often crops out in the jury room. In one instance, after the patience of most of the jurors had been exhausted, one of the enraged ones sprang to his feet, shook his finger in the face of the obstinate member, and asked 'Didn't the judge tell us that if there was negligence shown on the part of both defendant and plaintiff, the verdict must go to the defendant? 'Yes,' answered the objector 'Have we not established the actual fact that both parties were negligent?" 'Yes' 'What else can you do, then, but vote for the defendant?' 'That's all,' admitted the recalcitrant one 'What are you hanging out for, then?' 'Well, I'd like to give the plaintiff a little something, and I shall hold out here all day unless we do it!' 'Like hell you will,' snapped the angered juror you don't vote for the defendant in the next two minutes you'll get a bung on the nose!' Such men sometimes have to be jounced into line, especially when they agree in the main with the majority, but want to hang out on petty details"

But some captious critic of the jury system may observe How can twelve ordinary men be competent to decide a case? What do they know of the canons of decisions? How possibly can they be versed in the nature of the judicial process? Such critics might abandon this attitude were they to read those fascinat-

ing essays which have just come from the Columbia Press, and whose author is the distinguished Benjamin N Cardozo called these interesting pages "The Paradoxes of Legal Science" "When," he says, "I asked an American judge, who is widely admired both for his skill and for his impartiality, how he and his fellows formed their conclusions, he * * * laughed, and said that he should be stoned in the street if it were known that, after listening with full consciousness to all the evidence, and following as carefully as he could all the arguments, he waited until he 'selt' one way or the other" If that is the way in which judges decide, surely there can be no just criticism of jurors when they employ the same method

After all, justice is a thing "felt" and perceived, rather than defined. It is not administered in accordance with the rules of Euclid but in conformity with the principles of life and human nature. "The sacred rights of mankind," said Alexander Hamilton, "are not to be rummaged for in old parchments or in musty records. No, for they are written as with a sunbeam in the whole volume of human nature, where they can never be obliterated or obscured by mortal power." Edmund

Burke somewhere said in substance that the ultimate purpose of all taxation, of all armament, of the navy and of the army, and of government itself, was to bring twelve honest men into the jury box

The jury system is protected in the United States courts by the Federal constitution, and in our State courts by the constitution of our May we never lose it! In the court-State room before twelve men, there is daily unfolded the thrilling drama of human life Kindness and malice, affection and hate, good faith and chicane, duress and fair dealing, run through the texture of the plot like the warp and woof of some fascinating priceless tapes-There rivaling all the emulations of the stage, the book of life is daily opened, where even those who run may read Were the jury system to be eliminated, much of the drama, the color, the thrill and the romance of trials and courts would be taken with it But were this system of administering justice to be changed, there would likewise go one of the greatest guarantees of liberty which Anglo-Saxons were able to devise, and which their descendants appreciated and retained in the fundamental laws of both the nation and the state

FAILURE TO ATTEND AT DELIVERY

An obstetrician had been consulted by a patient on June 5th and upon examination he found that she was pregnant. The patient gave him a history of having given birth to three dead children The obstetrician found that the patient's pregnancy did not correspond with her history of menstruation He prescribed lutein extract in capsules On June 12th the patient telephoned the obstetrician that she was spotting and staining and the patient was advised to enter a hospital That evening the patient was seen by the physician at the hospital On the following morning when he called he found that she had expelled a dead fetus of about four months' gestation Thereafter he called upon her daily until June 16th, giving her the necessary care and attention for her condition On the following day the physician left for Europe, leaving the patient in The patient was never the care of his assistant thereafter seen by the obstetrician He was not paid for his services and in an attempt to collect for the services a suit was instituted by him which resulted in a malpractice action

In this action it was charged that in May, when the plaintiff was pregnant with child, she had engaged the defendant obstetrician to render her all necessary professional services in connection with her expected confinement, and that the defendant as such physician and surgeon under-

took to render this service to the plaintiff she was requested by the defendant to notify him when she experienced labor pains, and that on June 12th she had notified the defendant of this condition That she was directed to enter a hospital where the defendant would attend her was charged that the defendant did not render the necessary services to the plaintiff, but failed and neglected to do so and that shortly after entering the hospital the plaintiff was delivered of a dead male child by the head nurse of the That after the delivery of the child the defendant had called upon her at the hospital and that she requested him to render her the necessary treatment, but that he failed and refused to do so and permitted her to be without service or treatment of any kind. The patient further charged that the defendant had failed to render the necessary services in connection with the delivery of the afterbirth That she was confined in the hospital for a period of eight days during which time the defendent wholly failed and refused to render any services That she was compelled to be in bed for four weeks after leaving the hospital and that by reason of the inattention upon the part of the defendant, her health became undermined and impaired, that she lost considerable blood and suffered great pain in her abdomen and back

1064 LEGAL

The action came on for trial and on cross-examination of the physicians who testified in behalf of the plaintiff, it was shown that the results complained of by the plaintiff were the natural consequences of her pregnant condition and the delivery of the

dead fetus That there was no negligence or carelessness upon the part of the defendant and nothing that he had done or failed to do was the cause of her alleged injuries. The trial resulted in a verdict in favor of the defendant

SCALP WOUND—SUBSEQUENT CELLULITIS

This was an action brought on behalf of an infant patient. The complaint charged that in the month of July the child was struck on the head, as a result of which, he had sustained a severe gash on the scalp That the defendant physician had represented himself as a skillful and competent physician and was employed to operate and did operate upon the infant patient in his endeavor to cure him of his wounds. That the operation and treatment of the defendant were negligent and careless and he permitted filth and dirt and other foreign substances to remain in the scalp, as a result of which the infant patient sustained a cellulitis causing the patient to be confined in a hospital for about six months and otherwise causing him injury and damage

One action had been instituted in this matter and after the joinder of issue was placed on the calendar. However, when it was about to be reached for trial it was marked off the calendar and no steps were taken by the plaintiff to restore it for trial. On behalf of the defendant a motion was made to dismiss the case for lack of prosecution. Thereafter a new action was instituted which finally came on for trial. The plaintiff, after making numerous attempts to procure a settlement, and being unsuccessful discontinued the action.

One July afternoon there came into the office of the defendant physician a boy about ten years of age who had a scalp wound about an inch in length and about a quarter of an inch deep. The skull was not touched, nor were any arteries severed. The parts around the wound were shaved by the doctor and cleansed with tincture of green soap and water. After the wound had been washed, it was sterilized with a 2% solution of lysol, thereafter dried and tincture of iodine applied. Three sutures were taken in the wound, the needle being sterilized before being used and the sutures were silk worm gut. A sterile dressing was then applied to the wound. The patient

was directed to return within forty-eight hours Upon his return the dressing was removed and the wound inspected, which appeared clean and in good condition. There was no evidence of any infection or inflammation, no swelling, no pus

Tincture of iodine was again applied to the wound and a sterile dressing placed thereon. At each of the times that the child was seen by the physician, he and his mother were instructed that the wound, the bandage and the parts around it should be kept clean. After the second visit the child was instructed to return in about four days. At this time there was no bandage on the wound. However, the wound had healed by first intention and the sutures were then removed. Iodine was again applied to the wound and a dry dressing placed over it, and the patient discharged from further care.

Two days thereafter the child, accompanied by his mother, returned to the doctor stating that the child had a temperature The physician exammed the heart, lungs and abdomen of the child and found everything normal, except a slight intestinal disturbance. At this time the doctor's attention was not directed to the wound and no examination was made of the wound and no complaint made by the mother of the child with respect to it The physician prescribed for the intestinal disturbance and it was the last time that the child was seen by the physician About two months later several men called at the doctor's office demanding money from him, charging that he negligently and carelessly treated the child They stated that it was necessary to send the child to a hospital, that the mother had no money to meet the hospital expenses and demanded that the doctor meet these expenses These men and the mother becoming abusive and insolent, the doctor ordered them from his office Thereafter this malpractice action followed which subsequently terminated in his favor

NEWS NOTES

THE LAKE KEUKA MEDICAL AND SURGICAL ASSOCIATION

The twenty-ninth annual meeting of the Lake Keuka Medical and Surgical Association proved to be one of the greatest gatherings of its kind ever held in this part of the country. First of all the registration of physicians was two hundred and seventy—a record attendance, besides, many guests, including wives, filled the meeting hall to capacity. The meeting hall, by the way, it out over the water and the view one gets out of the open windows is quite well worth mentioning. It is undoubtedly one of the prettiest spots in America.

Also the program this year was of excep-

tional character

Friday morning, July 12th, the meeting was officially opened by Dr Albert M Crance of Geneva, president of the Association, who called upon Dr James Vander Veer of Albany, president-elect of our state society to bring the greetings from the State Society Harry Trick of Buffalo, president of the State Society, was also called upon for a few remarks which were well received by the large audience Incidently, the chair recognized several prominent state society officials in the front row and made mention of each name These included Past President Dr George Fischer of Utica, Past President Dr James Sadlier of Poughkeepsie, Dr John Card, Speaker of the House, and Dr Joseph Lawrence, executive officer for the State Society

The scientific program opened with a splendid address on "The Recognition of the More Obscure Cases of Prostatic Obstruction," by Dr Arthur L Chute of Boston Discussion was opened by Dr Elmer Hess of Erie, Pa, followed by Dr James N Vander Veer, of Albany, Dr Ernest Watson of Buffalo and Dr Caryle Haines of Sayre, Pa The meeting adjourned for a delightful dinner which included Lake Keuka trout served in excellent style under the management of Mrs B M Young, proprietress of the Keuka Hotel

The afternoon session opened promptly at 1 40 with the meeting hall filled to capacity Three excellent addresses were given during the afternoon Dr Frank Lahey of Boston, gave an address on "Goiter" Discussion was opened by Dr Marshall Clinton, of Buffalo, Dr Donald Guthrie, of Sayre, Pa, Dr William Johnson of Batavia, and Dr Frederick S Wetherell of Syracuse, N Y Dr William Allen Pusey of Chicago gave an excellent address on "Eczema" Discussion by Dr George M Fisher of Utica, N Y, Dr Earl D Os-

borne, of Buffalo, N Y, Dr Albert MacFarland of Rochester and Dr Herbert H Bauchkus, of Buffalo, N Y Dr E Livingston Hunt of New York City, gave an excellent moving picture clinic on Locomotor Ataxia Discussion was opened by Dr G Kirby Collier of Rochester, N Y, Dr Eugene N Boudreau of Syracuse, N Y and Dr David C Wilson of Clifton Springs, N Y Following the first day scientific session, the doctors enjoyed swimming, motor boating and all of the various sports at this resort. In the evening dancing took place in the same hall out over the water

The Friday morning session opened at 10 A M with the largest attendance on record for the second day session, and we listened to a wonderful talk by Dr Isidor Rubin on 'Sterility and Infertility" This was discussed by Dr Thomas Farmer of Syracuse, Dr James King of Buffalo, Dr Stuart B Blakely of Binghamton and Dr George Gelser of Rochester

Lastly, a splendid address on the "Control of Cancer" was given by Dr Joseph Colt Bloodgood of Baltimore Dr Bloodgood's views on cancer alone were well worth hearing and many pronounced it the most wonderful address on this subject that they had ever heard Exceptional discussions were led by Dr John Swan, of Rochester, Dr Walter Machemer of Buffalo, Dr Arthur S Chittenden of Binghamton, Dr Otto K. Stewart of Hornell and Dr Arthur Booth of Elmira, N Y

As is customary, following the Thursday afternoon program all the chairmen from the twenty-one counties included in this society plus all the past presidents in attendance assembled to transact the business of the association. At this meeting the following officers were elected for 1929 President, Dr Joseph R Wiseman of Syracuse, N Y, Vice-President, Dr William J Tracey of Hornell, N Y, Secretary-Treasurer, Dr John A Hatch of Penn Dr Hatch will succeed himself for the sixth time as Secretary-Treasurer of this organization, and before closing, the entire society owes to him many thanks for his untiring efforts in putting this large meeting over, and more so this year than on any previous occasion

The new officers, it is understood, are already at work on the program for next July, and we dare say that the next meeting will be still larger than the one of this year which has broken all previous records. Doctors are beginning to realize that the Lake Keuka meet-

ing gives them two days of outing combined with a scientific program made up of men who are authorities and widely known in our profession, selected from all parts of the country. The speakers feel that they have been highly honored to be asked to address this association.

The association furthermore is a help to the state society and has for the past few years realized this fact by giving a place on the program to the president-elect so that more physicians may get to know him and thereby create a deeper interest in the relation between the physicians and the State Medical Society

NEW YORK ACADEMY OF MEDICINE ACTIVITIES

of Medicine has nearly completed its plans for the two-weeks' course in the medical problems of old age, which was announced in this Journal of July 15. A description of the course and a post card for reply were sent to every doctor in New York City and a radius of one hundred miles, and over 3,000 replies and inquiries have already been received. Physicians have shown an exceptionally great interest in the course, and the prospects are that it will be eminently successful.

The course will extend over the two weeks beginning October 1st. The mornings will be devoted to hospital chines. Lectures will be given in the late afternoons and in the evenings in the Academy Building at 103rd Street and Fifth Avenue. Supper will be served in the Academy on the days of the lectures.

The practical scope of the lectures may be judged from the following examples chosen from nearly fifty lectures which compose the complete course

Dr George E Vincent, President, Rockefeller Foundation "The Doctor-Trainer or Healer?"

Dr Alfred S Warthin, Professor of Pathology, University of Michigan—Carpenter Lecture "Pathological Processes in Aging"

Dr Solomon Strouse, Associate Professor Medicine, Northwestern University "Food and Food Habits"

Dr Menas S Gregory, Director Psychopathology, Bellevue Hospital "Psychoses in Old Age"

Dr Harlow Brooks, Professor Clinical Medicine, New York University and Bellevue Hospital "Angina Pectoris"

Dr Russell L Cecil, Visiting Physician,

Bellevue Hospital "Arthritis and Old Age"

Polionivelitis Serum—The New York Academy of Medicine is making a study of poliomyelitis, and has appointed a special committee to study the disease. One phase of the work of the Committee is described in the New York Medical Week of August 4, as follows.

'This committee has determined to procure convalescent serum which will be placed in the hands of a number of physicians in the five boroughs, who will act for the committee in obtaining a complete record of each case in order to determine the effectiveness as well as the most satisfactory method of administering the serum Reports from different observers have shown that, if convalescent serum is administered prior to the onset of paralysis, good results are obtained in many instances The serum is administered either intraspinally and intravenously, or intraspinally and intramuscularly, and a few observers have reported favorable results with the administration either intravenously or intramuscularly alone

"The committee has arranged to distribute to each of the physicians whose names and addresses are given below one or more doses of the serum, and they may be called upon by any physician in Greater New York for the administration thereof. The committee points out that the supply of serum will be very limited, that it is of very doubtful value after paralysis has been noted, and that, although the diagnosis is difficult, it may be made prior to the onset of paralysis. These physicians may be called upon to aid in the diagnosis.

"The Academy will charge \$25 for the administration of the serum, which is less than the cost of obtaining and administering it"

SUFFOLK COUNTY MEDICAL SOCIETY

From the June issue of the Monthly News Letter, published by the Suffolk County Medical Society

Those meetings of the Suffolk County Medical Society which have been held in the Central Islip State Hospital have always been well attended, and the last one, which was held on May 31, was no exception

There were present staty practising physicians from various parts of the County in addition to ten or fifteen members of the Staff of the Central Islip State Hospital Also, there were present a majority of the public Health Nurses of the County and a number of wives of the members, so that the total number who sat down at luncheon

at 1 30 o'clock was eighty-eight The Suffolk County Medical Society has followed the unique practice of inviting public health workers to its meetings. The physicians of Suffolk County feel their responsibility in all forms of public health work, and they realize their dependence on the Nurses and Parent-Teachers' associations and other societies for the education of the people in all lines of preventive medicine The Nurses are prepared to understand the programs of the Suffolk County Medical Society meetings, for nearly all of them have taken public health courses which physicians who have not studied the subject would have difficulty in follow-It is not that the Nurses are learning to practice medicine, but they are learning methods of carrying on educational work among the They are also learning how to conduct epidemiological investigations, and it is the Nurses on whom the public health officials must depend for the discovery of mild cases when epidemics break out.

The meeting on May 31 was of peculiar interest to Nurses as well as to the physicians, for the principal speaker was Dr W H Park, and his subject was Poliomyelitis, or Infantile Paralysis Dr Park reviewed the present state of our knowledge of the cause of this disease. One point which he stressed was that, while the disease is always with us and it has been unusually prevalent during the past year, yet he saw no reason to anticipate any such widespread epidemic as spread in 1916.

Dr Park reviewed, also, our knowledge of the virus of the disease and of the methods inducing immunization His views are of special value since articles frequently appear in the Journals, both medical and lay, that the cause of the disease has been found and sure methods of its control have been developed As a matter of fact, the standard methods which were developed and adopted in 1916 still apply at the present time The principal point for the doctors and nurses to consider is that on them lies the responsibility of the detection and prevention of the disease Mild cases are constantly occurring, and if they are recognized promptly and are controlled, the spread of the disease will probably be effectually

prevented Experts from the State Hospitals at Central Ishp and Kings Park will be available to any physician for diagnosis and consultation

Another feature of the meeting was the exhibition of moving pictures illustrating neurological conditions in the patients of the Central Islip Hospital These pictures showed gaits, reflexes, tremors, facial expressions and other symptoms and signs by which diseases of the nervous system They have the special value of are recognized enabling the physicians to visualize the conditions which are described When a patient is brought before an audience, there is considerable delay in getting a response to the doctor's suggestions and questions, but the moving picture shows the action within a few seconds, and it can be repeated over and over, as often as desired Those who saw the pictures will be able to visualize the conditions of the patients much better than by an observation of the patients themselves

The program included clinical reports from the general hospitals of the County Drs David H Hallock and David Edwards described a case of osteomyelitis which occurred in the Southampton Hospital, and showed X-ray pictures of the condi-The striking point about the case was that the patient, a boy, had slight bone trouble and stiffness of his arm which developed into an abscess in the bone in the course of three or four The nature of the process was not perceptible by the X-rays at first, and a diagnosis was difficult until the stage of destruction of the bone had been reached The impression left by the description of the case was that physicians should have the disease in mind when they are confronted by obscure signs of tenderness or other conditions of the extremities

Dr Shlimbaum described a case of hemorrhage in the pleural cavity of a new-born baby in the South Side Hospital at Bay Shore. The treatment adopted was the hypodermic injection of fresh blood from the mother. This treatment is standard, and is nearly always immediately effectual.

After the luncheon the Nurses and ladies in attendance were shown the occupational therapy work in the Central Islip State Hospital Occupational Therapy has a very great value in the rehabilitation of the mentally deranged, and many of them are normal mentally while their hands are occupied. The patients are pleased with the opportunity to occupy their minds and hands and the occupation is a great factor in making the patients contented and happy.

It is coming to be a fact that most patients in the hospitals for mental diseases are happy and contented. This is as it should be, for mental disease is as susceptible to treatment and cure as that of the physical body.

MEDICAL WARES

BAKING POWDERS

The wholesomeness of baking powders has been often questioned Insinuations regarding their hygienic quality originated principally among rival manufacturers, each seeking to promote the sale of his own product by disparaging another's powder Doctors and dieticians have little or no criticism of the standard baking powders that are on the market, but they consider all the popular brands to be wholesome

All baking powders act by liberating carbon dioxide gas from sodium bicarbonate by an acid constituent in the powder. The old fashioned leavening consists of soda alone, and a liberation of the gas was done by the lactic acid of sour milk. These soda and sour milk mixtures are still used as leavening by many expert housewives.

A modern baking powder consists of soda mixed with an acid product which will liberate the carbon dioxide gas in the presence of water. The three acid constituents which are in common use are (1) tartaric acid or its acid salts, especially cream of tartar, (2) calcium acid phosphate, and (3) sodium aluminum sulphate kidneys and may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation. However, the quantity of tartrate a cake made from baking powder is far small may produce some degree irritation.

The United States Department of Agriculture has adopted the standards for a baking powder and require that it shall yield not less than twelve per cent of carbon dioxide gas by weight. The common baking powders actually yield fourteen or more per cent when they are fresh, but containers are not air-tight and they admit some air containing moisture and so there may be a slight evolution of gas. In order to prevent this chemical action, starch that has been thoroughly dried under heat, is added to the powder. Since the starch is somewhat hygroscopic, it absorbs water more readily than the other ingredients of the powder and so protects them.

White of egg is also added to some powder for the special purpose of enabling anyone to make a rapid test of the amount of carbon dioxide that the powder will produce. When a teaspoonful is placed in a drinking cup of water and two or three teaspoonfuls of water are added, carbon dioxide gas will be evolved for a minute or two, and will form bubbles which will fill the cup. The white of egg makes the water viscid and so renders the formation of the bubbles possible

Much has been written about the menace of 'alum' No baking powders contain alum, and none produce alum as a residue. The scare

about alum has been advertising propaganda put forth by those who use other acid ingredients in place of an aluminum salt. When the sodium aluminum sulphate of a baking powder acts upon soda bicarbonate, it produces sodium sulphate, which is Glauber's salt, and aluminum hydrate, which is mert in the body

When calcium acid phosphate unites with soda in baking powder, it forms phosphates of calcium and soda similar to those that exist in all the tissues of the body, especially the bones

The claim has been made that tartaric acid powders are especially safe, because they are "purely vegetable" As a matter of fact, tartaric acid is not oxidized in the body to mert carbonates, as are other acids, such as citric and malic acid, but they or their salts are excreted by the kidneys and may produce some degree of irritation. However, the quantity of tartrates in a cake made from baking powder is far smaller than the therapeutic dose of cream of tartar.

A self-raising flour is simply flour to which baking powder has been added. There is no government standard for a self-raising flour, or any supervision over it as there is for baking powder. Any kind of baking powder may be used, and the flour may be stored for months or years until all its gas has been evolved and it is no longer self-raising, and yet it may be sold with impunity

Baking powders differ in the rapidity of their action. A tartaric acid powder is rapid and begins to evolve gas as soon as water touches it. A sodium aluminum powder is slow and requires the heating of the powder to start its action. A phosphate powder has a speed intermediate between the other two.

When a batter or dough made with a rapid baking powder is placed in a slow oven, all the gas may escape before the heat has hardened the mass, and then the cake will collapse and be sodden and soggy. When it is made with a slow baking powder, and is placed in a hot oven, the heat may harden the crust before the gas has been evolved and then the pressure of the hot gas bursts the cake open.

The wholesomeness and attractiveness of a cake or loaf made with baking powder will depend upon the skill of the cook rather than on the constituents of the baking powder. From a medical point of view, all baking powders of the U.S. government standard are equally good and wholesome

M

THE DAILY PRESS

DRINKS, COLD OR HOT?

One of the principal rules of health stressed by the older school physiologies was a warning against ice cold drinks, but their general use in this country has not been followed by the dire results that were predicted

The New York *Times* of July 16 has an editorial comment on the use of cold drinks on hot days as contrasted with the prevalent custom of the English in India to take hot drinks for their cooling effect. The editorial reads

"Doubtless doctors and those who have lived in the tropics will take issue with the Assistant Surgeon General who warns against the use of hot tea in hot weather. This flies in the face of long experience in tropic lands

"To be sure, we in the northern part of the United States have steadfastly refused to consider our summer climate tropical, despite the fact that on many days temperature and humidity exceed the average in equatorial countries We have also a tradition of cold drinks to uphold,

having for generations delighted in chilling our summer beverages

"But the English and others who have long lived in the tropics and have tried drinks both hot and cold have learned the danger of loading too much very cold liquid into overheated stomachs and the advantage of taking plain, hot tea instead. The theory is that, although the hot tea produces a momentary excess of heat, it is followed by increased activity of the pores which, in turn, produces an agreeable sensation of coolness.

"To most Americans this idea is not attractive. The suggestion that a hot drink can be cooling they regard as laughable. But it would be a pity if the 'rules' issued in Washington should deter people from using this tried and successful method of mitigating the discomforts of excessively hot weather."

The whole theory of heating and cooling the body is being turned topsy turvy. We light the gas under the refrigerator, and now we will put the teakettle on the electric range in order to brew a hot drink that is cooling

HALF COOKED VEGETABLES

Every discovery in foods leads to new theories regarding cooking and food serving. Vitamines are impaired by long cooking not because of the length of time, but because of oxidation. Now comes the cult of the half cooked vegetable.

The New York *Times* of July 26 discusses this resurrected cult in an editorial as follows

"For certain foods it is an excellent plan to keep them at or near the boiling point for hours. But many meats and most of the green Summer vegetables are spoiled by too much cooking. Steaks, chops and roast beef are not only more fully flavored but more digestible if lightly cooked. That mysterious element, the vitamin, is destroyed in long cooking. Dr. Ruth Okey of the University of California is trying to educate people to demand their vegetables rare.

"Instead of ordering a 'blue-plate,' with a steak cooked to leather and green peas in a mush, a man is expected to demand a minute steak, ac-

tually on the fire a minute, and green beans, cabbage, spinach or carrots out of the kettles in fifteen minutes. Potatoes are an exception, but even they should not be allowed to go on cooking after they are tender."

Who wants to eat a beanpod cooked for only fifteen minutes? Every farmer boy of the old type knows that succotash and samp are not really edible until they have simmered on the back of the stove for three days. If their vitamines are destroyed, he will be willing to eat dandelion green because they are "good for the blood"

Much of the popular writing on dieting gives the impression that every dish must constitute a balanced diet and must contain a proper balance of vitamines and mineral salts. But normal people will prefer to eat what they want and how they want it, and are not willing to eat food "that is good for them' more than once a day

PROVINCIALISM

Where would you look for the best example of provincialism? The New York Times makes out a good case for New York City when its issue of July 16 makes editorial comment on the death of an employee of the Consolidated Gas Company for seventy-two years who had been to the Battery once and to 125th Street once The Times comments

"No doubt this is a highly exceptional case If there is one thing that New York seemingly connotes, it is mobility, with its inward and outward subway tides on weekdays and its vast migrations to the beaches in the Summer Nevertheless there are great masses of people in New York who know little or nothing of their city outside the routines of their work and their pleasures Greenwich Village has its own restricted circuit and the midtown Broadway popu-

lation its own Were it not for the discovery of Harlem as an esthetic sensation, it is a rare member of the literati who would ever be found north of 110th Street"

New York is provincial without doubt The average citizen follows his own rabbit path from his home to his factory and his club. The subway is a mystery to him. The word mystery is derived from the Greek mus, mouse, and terion, place, that is, a mouse hole,—and a mouse hole is a mystery, for no one knows where it goes. No one seems to know where all the subways go, and no guide book tells. Possibly some day a research worker will patiently trace the subways and map them for the benefit of rural visitors whose cosmopolitanism has not been contracted into the provincialism of the metropolis.

LENGTHENING SPAN OF LIFE

The New York Times of July 6 discusses a report on population studies made to the National Committee on Mental Hygiene by Dr Ira S Wile, Chief of a children's psychiatric clinic at Mount Sinai Hospital, New York Dr Wile is quoted as saying

"The population of this country today seems much younger that it did fifty years ago, because it is actually much older

"This apparently contradictory conclusion finds its explanation in changes in the habits and circumstances of life from 1870 to 1920. The crux of these changes lies in the fact that the birth rate has declined while the expectation of life has increased about fourteen years. As a result the average age is much higher, and there are today proportionately many more persons over 30 than there were in 1870.

"In 1870," Dr Wile reasons, "it was more of an achievement to reach old age, and therefore the aged were revered and their backward-looking outlook on life was emulated

"Today there are proportionately half as many persons again over the age of 50 as there were in 1870, he estimates Since they are less of a rarity, they have been ousted from the position of pace-setters for the population and they no longer try to make the number of their years conspicuous

"The other half of this picture is the consequence of a diminished birth-rate. The diminishing proportion of children has turned the spotlight of comparative rarity, and consequent comparative preciousness, upon the young. The infant of today is precious because of his rarity, as was the old man of 1870 for the same reason."

BOOK REVIEWS

TROUBLES WE DON'T TALK ABOUT By J F MONTAGUE, M D 12mo of 248 pages Philadelphia and London, J B Lippincott Company, 1927 Cloth, \$200

This well-written volume of 241 pages is a popular treatise on the more common ano-rectal afflictions, and is dedicated by its author "to those who suffer in silence and carry on in despair." The author deserves the gratitude of all proctologists and all those interested in better rectal surgery for his timely warning to the general public, on this much neglected subject. While diseases of the nose, throat, teeth and other foci of infection have received more than their due publicity at the hands of health authorities, and the lay press, ano-rectal diseases, by far the most important focus of infection in the body has been utterly neglected. Thus through the patient's false sense of modesty plus the physician's indifference, many incurable but avoidable diseases occur in that region

His chapters on the indiscriminate use of stomach pills, rectal suppositories and self-medication in general are particularly instructive. On the whole, the book makes for easy and useful reading to the lay public, and can be recommended as a valuable addition to one's library

One could wish, however, the author didn't "rub it in" quite so hard into the "other doctor". The book abounds in all sorts of criticisms and phrases derogatory of other surgeon's methods, and highest praise of the author's own methods. This may be all very well if stated at its proper time and place, namely at a meeting of a medical society, but on the lay mind it may have the effect of undermining his confidence in "other doctors" altogether

However, the qualities of the book by far outbalance the above-mentioned faults, and is therefore to be highly recommended.

MICHAEL CANICR

BACTERIOLOGY AND SURGERY OF CHRONIC ARTHRITIS AND RHEUMATISM WITH END-RESULTS OF TREATMENT BY H WARREN CROWE Quarto of 187 pages, illustrated London and New York, Oxford University Press, 1927 Cloth, \$9.00 (Oxford Medical Publication.)

This book by the author of a previous volume on the treatment of these diseases presents a somewhat different classification from the one the most used at present in this country. This is the division of chronic arthritis into rheumatoid arthritis, osteoarthritis and mixed arthritis. The type called rheumatoid arthritis corresponds in a general way to the degenerative arthritis of Nichols and Richardson as adopted by Cecil and others and the osteoarthritis to the proliferative arthritis of the American writers. A particular type of staphlococcus called the micrococcus deformans is believed by the author to be the cause of rheumatoid arthritis and he describes in detail the bacteriological technique he uses to identify this organism. Osteoarthritic symptoms are believed to be due to streptococci and in mixed arthritis both organisms are present

The writer quotes from the book of Weston Price on Dental Infections and Degenerative Diseases to show that radiograms can never be relied upon to prove the absence of dental infection and also to show the difference in reaction around infected teeth in different people, as apical granuloma and condensing osterits. The former is said to occur in resistant individuals and the latter in

susceptible ones

The intestine is believed by the writer to be quite as important as a focus of infections as are the teeth, but he states that he is not convinced of the etiological relation ship between tonsillar sepsis and these diseases The volume is an interesing one and evidently the result of much careful work but presents ideas different in many respects from those generally held in this country

W E McCollom

Medical Insurance Examination Modern Methods and Rating of Lives for Medical Practitioners, and Insurance Officials By J Paterson MacLaren, M.A., B Sc Octavo of 312 pages New York, William Wood & Company, 1927 Cloth, \$575

PART I Given up to the Examination of Applicant, Inspection and First Impression, with a method of cross-examination to bring out the past physical history where such information is frequently held

PART II Physical Examination of Applicant, taken up in the routine way Some attention is given to labora-

tory methods

PART III A compilation of the usual insurance impairments with special attention to Build Tables, Blood Pressure Tables, and the More Usual Impairments frequently met with in the average applicant for Life Insurance Some attention is given to the Rating of Lives with the present methods in use.

The book contains nothing new, but is simply a compilation of the methods used in routine physical examinations and the method used in the selection and rating of impaired lives, and should be of value to any Life In-

surance library

G HOLBROOK BARBER

THE HARVEY LECTURES Delivered under the Auspices of the Harvey Society of New York, 1926-1927 Under the Patronage of the New York Academy of Medicine By Dr Fred Neufeld, and others Series XXII Octavo of 164 pages illustrated Baltimore The Williams & Wilkins Company, 1928 Cloth, \$400

This volume of Harvey Lectures represents the twenty-second of the series. It will be profitable to enumerate

the contents of this volume.

1 Origin and Dissemination of Tuberculosis According to Recent Investigations Dr Fred Neufeld, Director of the Robert Koch Institute, Berlin, Germany

- 2 The Nature of the Living Cell as Revealed by Microdissection Dr Robert Chambers, Prof of Microscopic Anatomy, Cornell University Medical College, N Y
- 3 Some Problems Concerning the Gastric Juice. Dr Leonor Michaelis, Prof of Physical Chemistry Applied to Medicine, Friedrich Wilhelm University, Berlin, Germany

4 Analysis of the Action Potential in Nerve. Dr Joseph Erlanger, Prof of Physiology, Washington Uni-

versity, St. Louis

- 5 Health and Activity Dr Edgar L. Collis, Prof of Preventive Medicine and Public Health, University College of South Wales and Monmouthshire, Cardiff, Wales
- 6 Organic Chemistry, Its Relation to Medicine. Dr Richard Willstatter, Prof of Chemistry, University of Munich, Munich, Germany
- 7 The Exchange of Material between the Erythrcyts and its Surroundings Dr Merkel H Jacobs, Prof of Physiology, University of Pennsylvania Phila.

The papers present the modern scientific views in important fields of medicine. The above men are distinguished and their point of view most comprehensive.

HENRY M FEINBLATT

Physical Diagnosis By Charles Phillips Emerson, AB, MD Octavo of 553 pages, with 324 illustrations Philadelphia and London, JB Lippincott Company, 1928 Cloth, \$700

Physical diagnosis, the author says, is, and doubtless will remain, the primary and the fundamental method of diagnosis. Every advance in scientific medicine, he thinks, makes its problems greater, therefore harder Physical diagnosis is the second step in the proper study of a patient, and follows the first, which is the symptomatic exploration of the patient. The latter is made interesting by a fine knowledge of physiology, and the former by an equally fine knowledge of pathologic processes.

Physiology and pathology have a fabric which interweaves them, so that there is a sort of network to a study of physical diagnosis, the anatomy of the endeavor, so to speak Emerson fails to furnish evidence that he has ever seen this network in his mental processes, as he jumps from physical signs to headings of clinical diagnoses without any reason. He does not take a physical sign or a group of signs and work the problem toward its significance, but he vacillates first one way and then the other. To try to make himself emphatic he rushes into sprinkling the paragraphs with heavy black ink. This is most annoying to a reader, and lessens the influence of the writer.

The book is replete with all of the material which is to be found in all really good books on the subject but contains no new material of import, and often fails to consider advances of importance. Electrocardiography is placed in a status as if it were not of great use in the daily examination of patients. He is not familiar with its use from a personal standpoint, therefore, it is not important. If he had been conversant with its value, his discussion of auricular fibrillation would have been much more illuminating. The use of the X-ray as an aid in physical diagnosis receives scant consideration, while a large section is taken up with a sketchy presentation of dermatology, which is given much better in many other books.

Perhaps, subsequent editions of this book will result in the development of a philosophical way of presenting the subject matter, rather than following in the footpaths of books that are really stupid, and not at all helpful when a doctor is in the presence of a physical finding, the significance of which he is ignorant

J ARTHUR BUCHANAN

THE EVAMINATION OF THE CENTRAL NERVOUS SYSTEM By DONALD CORE M D 12mo of 248 pages, illustrated, New York, William Wood and Company, 1928 Cloth \$3 50

The book is intended for the use of medical students and especially for those who are beginning their neurological instruction. A chapter is devoted for such subjects as electrical reactions, the cerebrospinal fluid, the blood pressure, the history of the patient, speech, the psychosomatic and trophic disorders, the cranial nerves, and the sensory nervous system. Four chapters are given to the motor system, one for the voluntary muscle power, another for muscle tone, a third for reflexes, and still another involuntary muscle movements. It is a small book, but a good one, and one that covers a good deal of ground. Not only will the medical student find it useful, but the general medical practitioner will find it in excellent reference for general neurological examinations. On account of its compactness and accuracy of contents it is a really valuable little book.

I J SANDS

HANDBOOK OF DISEASES OF THE NOSE, THROAT AND EAR FOR STUDENTS AND PRACTITIONERS By W S SYME, M D 12mo of 400 pages, illustrated New York William Wood and Company, 1927 Cloth, \$500

This small volume is the second edition of the original

printing which appeared in 1920. It is primarily intended for the use of students and practitioners, but a careful reading discloses that nearly all of the more common and interesting phases of oto-laryngology have been touched upon. The author has made his text an expression of his own practical and long experience, so that questionable theories and treatment have been eliminated from the book.

The subjects on the direct examination of the air and food passages, X-ray examination, and diatherm are written in elementary style to acquaint the reader with

their possibilities

There are many X-ray photographs illustrating pathology in the sinuses, bronchi and oesophagus

The colored illustrations are helpful in understanding the text

There is a chapter setting forth the more common formulae used in therapy

This excellent volume can be recommended to any one who feels himself deficient in an understanding of the principles of oto-laryngology

BENJ H ABRAHAMS

THE MEDICAL DEPARTMENT OF THE ARMY Its History Activities and Organization By James A Tobes Octavo of 161 pages Baltimore, Md, The Johns Hopkins Press, 1927 Cloth, \$150 (Institute for Government Research Service Monographs of the United States Government No 45)

This is one of a series of monographs published by the Institute for Government Research which is an asso ciation of citizens for co-operating with public officials in the scientific study of government with a view to promoting efficiency and economy in its operations and advancing the science of administration. This volume of 160 pages deals with the history, activities and organization of the Medical Department of the Army An historical review of this Department occupies the first third of the volume and presents many of the difficulties which have been overcome in the present organization. The activities necessary for proper functioning is next given, and this is followed by a presentation of the Department as it is at present. Six appendices are given, one of which is a compilation of the laws relating to the Medical Department. This monograph is comprehensive and presents many valuable suggestions which may or may not be accepted by our legislative bodies.

HENRY M MOSES

THE PEARS OF MEDICAL HISTORY AN Outline of the Evolution of Medicine for the Use of Medical Students and Practitioners By Charles L Dana AM, MD Second Edition Octavo of 105 pages, illustrated New York, Paul B Hoeber, Inc., 1928 Cloth, \$300

That there is a growing interest in books pertaining to the history of medicine is evidenced by the fact of the appearance of a new edition of this work so shortly after the publication of the first edition

In this revision Doctor Dana has taken the opportunity to correct some minor typographical errors which occurred in the initial edition and to include some additional illustrations

For those wishing a brief, interestingly written account of the outstanding facts in the development of medicine from the earliest times to the nineteenth century, we heartily recommend this handbook

THE THYROID GLAND AND ITS DISEASES By NORBERT ODEON BOURQUE M D Octavo of 250 pages (Chicago The Author, 1927)

To borrow the titles of Dr Joseph Collins one may name this book "The Surgeon Looks at the Thyroid" In 250 pages the author has made a practical survey of our present knowledge of the thyroid gland including

its surgery. From an enormous mass of information, Dr Bourque has succeeded in crystallizing the important material and presented it in a practical yet scholarly form.

It is true as he states that nothing new is added, but the method of presentation is original. The usual anatomical points are cited with significance. The pathology and bacteriology of goitre are likewise practically presented. Clinical signs and symptoms, classification and differential diagnoses are clearly stated, and the reviewer was impressed with their unbiased and thoughtful elucidations.

The value of the Goetsch and basal metabolic tests is for reasons given, minimized X-ray and radium treatments are not encouraged Glandular therapy is advised when indicated There are valuable chapters on the Thyroid Gland in Pregnancy, Cancer of the Thyroid, the Relation of the Thymus to Thyroid Disorders, and, of course, a good bulk of the volume is devoted to thyroid surgery

The internist will find in this book a concise presenta tion of thyroid disease, and the surgeon—an invaluable guide to indications, technique, and management of thy

roid surgery

JOSEPH S BENDETSON

Mosquito Surveys A Handbook for Anti-Malaria and Anti-Mosquito Field Workers By Malcolm E. Mac-Gregor. Octavo of 293 pages, illustrated New York, William Wood & Company, 1928 Cloth, \$5.50

This publication is a well written and well illustrated handbook for Mosquito field workers. For those interested in the subject of mosquitoes, particularly in the islands of Mauritius and Rodriquez, this work, which contains so much information in so small a volume, should prove very valuable.

MAX LEDERER

PATHOLOGICAL PHYSIOLOGY OF INTERNAL DISEASES Functional Pathology By Albion Walter Hewlett, M D Revised in memoriam by his colleagues, Thomas Addis, and others Under the editorial supervision of George DeForest Barnett Octavo of 787 pages, with 164 illustrations New York, D Appleton and Company, 1928 Cloth, \$8 50

In this third edition the original form of the book has been followed by the associates of the late Dr Hewlett Recent advances in clinical physiology have been included. The original author was well qualified to write a book of this kind as he was first a trained physiologist and later professor of Medicine in the Stanford Medical School

It is a study of disease from the standpoint of function and as applied physiology is the basis of modern medicine, is a valuable book for the practitioner

The work is recognized as a standard one and will be found to be a valuable reference book of the whole

field of physiology as applied to medicine

W E McCollom

Understanding Human Nature. By Alfred Adler. Translated by Walter Beran Wolfe. Octavo of 286 pages New York, Greenberg, Publisher, 1927 Cloth, \$3.50

A collection of lectures on individual psychology prepared for the general reader with a view to help self-understanding and adaptation to difficult situations Unfortunately, the value of the book is largely undermined by verbosity, lack of clarity and long stretches of platitudinous text.

Frederic Damaau

TREATMENT OF DISEASES IN INFANTS AND CHILDREN By HANS KLEINSCHMIDT, M D Authorized translation of the fifth German edition with additions by

HARRY M GREENWALD, M.D. Octavo of 359 pages Philadelphia, P. Blakiston's Son & Company, 1928 Cloth, \$500

Dr Greenwald, the translator as well as editor, is to be commended for making available in English the wellknown book of Prof Kleinschmidt, which reflects the therapeusis practiced at Czerny Clinic in Berlin, of which Prof Kleinschmidt was formerly a member

The style is admirably terse, and the author does not permit himself to cloy the book with extraneous discussion. Considerable space is devoted to infant feeding and the management of nutritional disturbances, all from

the point of view of the Czerny Clinic.

The therapeutics of practically every disease occurring in infants and children is presented clearly and succinctly. Minute instructions are given for the mode of procedure in each disease, and useful prescriptions are appended. A commendable feature of the latter is the comparative paucity of untamiliar proprietaries, which mar the usefulness to American physicians of more than one German text-book.

Dr Greenwald has interspersed in the form of Translator's Notes, a considerable amount of material that should prove of great value to the American physician

The translation is admirably done.

Every practitioner who treats infants and children should find this "VADE MECUM" a useful addition to his medical library

Post-Mortey Appearances By Joan M Ross, MD Second Edition 16mo of 225 pages London and New York, Oxford University Press, 1928 Cloth, \$250 (Oxford Medical Publications)

We have often been asked by medical practitioners who have ocasion to do a post-mortem examination, whether we know of any small book to which they could refer for guidance in the technique and interpretation of the findings which they find at the autopsy table. We had to confess that we were not aware of any such publication. The standard text-books on pathology devote a chapter on post-mortem technique. But the volumes apparently seem too bulky for the average practitioner. In this small book of about two hundred pages Dr. Ross describes the post-mortem appearances in the various diseases in a short and concise manner. In the appendix are given, the average anatomical normals, length and weight of the fetus weight of the organs in newborn child the dates of ossification of the various bones and the ages of eruption of teeth. This booklet should fill the want.

EDWARD H NIDISH

THE PRINCIPLES OF INFANT NUTRITION AND THEIR PRACTICAL APPLICATION By K. H. TALLERMAN, M.C., M.D., and C. K. J. Hamilton, M.C. Octavo of 183 pages London, William Heinemann, Ltd., 1928 Cloth 10 shillings, net

The writers give in a concise form a summary of this very important subject, taking up first of all, Bacteriology and Physiology, then the Nutritional Requirements of the Child Next there is a chapter on Breast Feeding followed by one on Nutritional Disturbances in the Breast The Premature Infant is then taken up, Fed Infant and Artificial Feeding and Nutritional Disorders of the The final chapter concerns Weaning and the Infant Diet, then there is the appendix appearing with the Preparation of the Various Formulas and Foodstuffs It would seem that there is no fundamental difference in the feeding of the children by Pediatricians in England and by those on this Continent. The bibliography is placed at the end of each chapter and its extensiveness bespeaks a very thorough combing of literature

WM HENRY DONNELLY

OUR NEIGHBORS

OBSTETRICS IN CATHOLIC HOSPITALS

Physicians wish to respect the religious beliefs of their patients, especially when those The practice beliefs are founded on reason of obstetrics frequently involves decisions regarding the life of either the mother or the child or both The Roman Catholic Church has formulated principles of action which are well stated by Dr Walker Gossett, of Louisville, in the July number of the Kentucky Medical Journal, who states that he has consulted eminent church authorities for the statements contained in his paper Since his presentation is unusually clear and reasonable, the following quotations are chosen with the recommendation that the entire paper be consulted

"When is the human fetus viable? When it is capable of living outside of the uterus"

"At what period is it lawful to effect premature delivery of the fetus as a means of saving the mother's life? Only when the fetus is viable, that is, at the end of the 26th week of gestation in hospitals properly equipped to care for the newly born In private practice, under the ordinary conditions, not before the end of the 28th week"

"What is direct abortion? It is that which is procured as an end, or as a means to an end, in other words the direct killing of the fetus Is it ever lawful for any purpose whatsoever to procure direct abortion? No "

"If it is morally certain that a pregnant mother and her unborn child will both die if the pregnancy is allowed to take its course, but if, at the same time, the physician is morally certain that he can save the mother's life by removing the inviable fetus, is it lawful for him to do so? No, it is not Such a removal of the fetus would be direct abortion In case of pernicious vomiting, which endangers the mother's life, is it ever lawful, as a means of saving the mother's life, to empty the uterus before the fetus is viable? No, for such a procedure would be a direct abortion is the same in cases of eclampsia before the fetus is viable After the fetus is viable in such cases it is lawful"

"If the membranes rupture before the fetus is viable, is it lawful to administer a drug to bring an abortion? No As long as child is alive, not by drugs or any other means"

"Hemorrhage from placenta previa that endangers the mother's life, before the fetus is viable, is it lawful to empty the uterus as a means of checking the hemorrhage and thereby

saving the mother? No, because to do so would be to procure direct abortion hemorrhage which endangers the mother's life may be controlled by tamponning the vagina this is not a direct attack on the child If the bleeding persists with separation of the placenta and death of the child it is not due to any direct attack on the life of the child, but as a result of abnormal conditions within the uterus, the vaginal tampon protects the mother and gives nature a chance to save the child if such be possible, if such be impossible the removal of the pregnancy products can be undertaken in safety to the mother when it is certain that the fetus is dead"

"In cases of threatened abortion the cautious administration of morphine is lawful, even though its use involves a real danger to

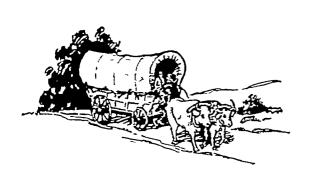

the child

"As to operations upon the pregnant woman Any operation that is necessary for the welfare of the mother and does not have as a direct result the death of the fetus is lawful fetus is present in the mother's uterus as the result of her own free will and such consequently can not be considered in the light of an aggressor The fetus has a right to life equal to that of the mother since both are living human beings, morally one may not be sacrificed that the other may benefit by such If, however, conditions arise, such for instance as appendicitis, cholecystitis, ovarian cyst with twisted pedicle, which threatens the life of the mother, operation upon such to save the life of the mother is lawful, even though abortion may result, since the loss of the child's life is an indirect result of such operation and not the result of a direct attack upon its life In the case of ruptured tubal pregnancy or of tubal abortion resulting in the death of the fetus in extra-uterine gestation, operation is lawful"

"In the presence of an unruptured tubal pregnancy there is a difference of opinion among theologians, some holding as unlawful the removal of such This presupposes the possession of greater knowledge and skill than is accorded to most physicians, namely, the ability always to recognize tubal or ectopic pregnancy and further to know whether or not such contains a viable fetus"

"Sterilization to avert a future danger is not lawful"

"At the time a cæsarean section is performed, (Continued on page 1076-adv xvi)

You Are Not Pioneering When You Prescribe

DRYCO

for Infant Feeding

- 1. Years of international clinical history have established its merit.
- 2. Current medical literature bears frequent reference to its efficacy.
- 3. Thousands of physicians know from experience that it can be depended upon for good results.

There is as great a difference between Dryco and ordinary dried milk as there is between certified and other liquid milk. The results obtained with the use of Dryco have made it an incontrovertible fact that Dryco is ideal for infants deprived of breast milk and is of especial value in difficult feeding cases.

CHESTER FORD DURYEA, M.D. DIRECTOR

(Continued from page 1074)

the uterus gives evidence of being infected, it is lawful to remove it, but never lawful to remove an uninfected uterus in order to forestall the danger of infection or produce sterility"

"At what period is it lawful to effect premature delivery of the fetus as a means of saving the mother's life? Only when the fetus

is viable"

"Is it ever lawful, under any circumstances, to administer a treatment to a pregnant woman, or to perform an operation upon her, that might cause an abortion, or might result in a killing of the fetus? Yes, it is lawful During pregnancy, before the fetus is viable, if a woman is suffering from an illness that does or does not endanger other life, it is lawful, in seeking to relieve such an illness, to administer a treatment that involves only a slight risk of causing an abortion or if indirectly resulting in the death of the fetus"

"In a case of threatened abortion before viability, in which the hemorrhage does not actually endanger the woman's life, it is not lawful to use a tampon. In an inevitable abortion, in which the hemorrhage does endanger the mother's life it is lawful to use a tampon"

"In a case of a threatened abortion the cautious administration of morphine is lawful even though its use involves a real danger to the fetus"

"It is never lawful to perform Embryotomy, Craniotomy, or any other operation directly destructive to the life of the fetus, whether the fetus is viable or inviable"

"During a delivery, the child dies, is it lawful to complete your delivery of the dead child in any manner that you may see fit, as embryotomy, craniotomy, etc? Yes, it is lawful if you are positive the fetus is dead. In such a case would advise with the Sister in charge of the delivery room."

"Catholic doctrine teaches that baptism is necessary for the full enjoyment of heaven and further that as soon as the ovum is fertilized, a life separate from that of the mother exists which possesses a soul, consequently in any medical or surgical illness which results in the premature expulsion or removal of the fetus, baptism should be administered to the latter before its death when such is possible Premature delivery before the period of viability, removal of the pregnant uterus on account of the presence of tumor, removal of pelvis mass which proves to contain an ectopic fetus are instances in which this can and should be done, in each giving the fetus to the Sister in charge, as soon as it is removed from the mother, for the performance of this rite the event of ectopic or uterine gestation re-

Please mention the JOURNAL when writing to advertisers

(Continued from page 1076-adv xxx)

moved for cause, the mass is to be opened immediately upon removal from the mother and the fetus exposed to view for this purpose

"In conclusion I would advise that the religious beliefs of Catholic patients must be taken into consideration where there are conflicts with obstetrical practice Also when in doubt concerning some moral problem consult the chaplain in charge of the hospital. If an emergency case then consult with the Sister in charge of the delivery room or operating

CATTARAUGUS COMMENT FROM TENNESSEE

The July number of the Journal of the Tennessee State Medical Association comments editorially on the Cattaraugus County Health Demonstration as follows

"The medical profession of the state of New York, particularly the profession of Cattaraugus County, have had experiences with the Milbank Health Demonstration which we have deemed of sufficient importance to warrant at-From the reports received it seems that the work touched every phase of medicine There was no limit to their activities, though they were supposed to be along the line of

preventive medicine "There frequently is no line of demarcation between the work of the sanitarian and the private practitioner of medicine In recent years vast sums of money have been appropriated by states, counties, municipalities, the tederal government and public spirited citizens for the promotion of the public health The motives which actuated these appropriations and donations cannot be criticised executives placed in charge of the expenditure of these funds and the workers under these funds are often deserving of criticism The activities of persons engaged in such work has brought about an animosity between the profession of medicine and some of these public health agencies Such a condition is not only useless but deplorable No physician has ever raised his voice against any legitimate effort at disease prevention Physicians are finding it necessary to protest actively against some of the policies of some of the public health agencies

'Some years ago the phrase 'public health is purchasable was comed. It has become a stock phrase. It is used very extensively. It is used sometimes to convey the idea that the more money that is spent in public health activities the more results will be gotten, but such is not the case. In the case of Cattaraugus County, New York, results commensurate

Brooklyn Newark Boston Springfield Detroit Chicago Wilkes Barre (Continued from page 1077-adv xyn)

with the expenditure are not apparent. It must be remembered that biologic laws and human equations are encountered which will not yield to padded statistics nor financial ap-

propriations

"The sane adaptation of practical means to practical ends will work. The employment of improper means or the improper employment of the proper means will bring disaster. For example, a moderate amount of money properly expended in the rearing and education of a boy will be of great advantage to him. An increase in the amount of money beyond the legitimate requirements of necessity may result in harm rather than benefit. The expenditure of ten thousand dollars per year on the boy might bring disaster when the expenditure of five hundred dollars per year would be very beneficial.

"There certainly is a limit to the amount of public health one man or agency can purchase for another man or a group of men

"We are prone to forget that the prevention of an overwhelming majority of diseases today is within the power of the individual and that the power of the state or public health agency to deal with many of the factors which enter into the production of disease is limited. It necessarily follows that improvement in the public health situation will be in proportion to individual effort and ability rather than in proportion to the money expended or the number of workers engaged in public health activities

"If the expenditure of a large sum of money in a given locality has the effect of disrupting and deranging the local community agencies created by that community for care of its sick, such harm will far outweigh any good such expenditures can do"

The Editor of the Tennessee Journal does more than state general principles,—he prints six pages of reports including the following

1 The eight principles adopted by the House of Delegates

2 The report of the Cattaraugus County

physicians

3 Address by the Secretary of the Cattaraugus County Medical Society before the Erie County Medical Society

4 Address of Dr L L Bigelow, President of the Ohio State Medical Association, before the Cattaraugus County Medical Society

5 Report of the AMA Trustees on health demonstrations by volunteer health agencies

The six page comment in the Tennessee Journal is a demonstration of the great importance which is imputed to the Cattaraugus Demonstration by physicians outside of New York State

THE MEETING OF THE AMERICAN MEDICAL ASSOCIATION

The July issue of Northwest Medicine, the official organ of the Medical Societies of the States of Oregon, Washington and Idaho, discusses the A M A meeting in an editorial which may be helpful to the physicians of New York State in planning their annual meet-

ing The editorial says
The atmosphere of the technical exhibits is somewhat different from that of the section meetings They bring together the manufacturers' representatives who present an orderly, well arranged, instructive showing of dependable products with trained attendants to explain their uses and advantages The greatest number of displays this year seemed to be of the physiotherapy and roentgen-ray apparatus trained experts were present at each booth to answer questions and explain problems of The latest models of apparatus for diagnosis, anesthesia and other uses were represented Problems pertaining to the special food diet of infants and invalids were considered, with experienced men ready to explain the advantages of their preparations Publishers' exhibits showed thousands of medical books, displayed in an attractive manner fact, one could have spent the whole time at these exhibits and profited by each minute

"The scientific exhibit presented names of exhibitors and descriptions of exhibits, arranged according to classification and then alphabetically according to the name of the ehibitor One of the outstanding exhibits was that on fractures It comprised an exhibit of practical interest to practitioners on the following fractures Fracture of the clavicle, supracondylar fracture of the humerus, fractures of the leg, fractures of the ankle joint, plaster-of-paris bandages (a) how to make them, (b) how to store them, (c) how to use them The committee secured the services of seventy-five physicians who gave continuous demonstration throughout the entire meeting daily from 9 to 1 and from 2 to 5 These consisted of well recognized methods of handling practically every fracture that may occur in any bone of the body The medical depart-The medical department of the United States Army contributed their part of this demonstration. In each booth the demonstrations consisted of a living model, with the necessary appliances for treating the fractures specified The Section on Radiology cooperated with the fracture exhibit by means of film displays, covering the fractures to be discussed in the year's exhibits Any physician who was at all interested in fractures could well have spent his entire time with the fracture exhibit and been benefited by it

NEW YORK

CHICAGO 59 E. Madison

(Continued from page 1079—adv xix)

"The booth on morbid anatomy was under the direction of Dr Elevius C Bell, Professor of Pathology and head of the department of Pathology, University of Minnesota Medical School Fresh pathologic material was shown daily from the hospitals of Minneapolis and St Paul, supplemented by material from the schools of veterinary medicine at Minneapolis I hese gross specimens were demonstrated, one after another, as rapidly as one group of men would move on to allow another group to listen in"

It would seem that the subject "Fractures," would be a proper one for the scientific exhibit at the next meeting of the Medical Society of the State of New York. It should arouse great interest among physicians, especially if various forms of fracture apparatus were demonstrated on living models, and extensive publicity were given to the exhibit through the Journal, the committee on Public Health and Medical Education, and the county medical societies

NEBRASKA PUBLIC HEALTH ASSOCIATION

The June issue of the Nebraska State Medical Journal contains the following news item

"Pursuant to call about fifty persons interested in the formation of a public health association met in Lincoln, May 14, and organized the Nebraska Public Health Association. The object of the association is to protect and promote public health by the closer correlation of all health activities, fostering and supporting constructive legislation and aiding in the dissemination of correct information with regard to public health.

"This movement should be supported by all high minded professional and lay people

'Any person interested in the movement may aid the cause by obtaining membership at the nominal cost of one dollar

"The officers of the association are Dr W H Wilson, Lincoln, president, F B O'Connell, Lincoln, J H Beveridge, Omaha, Miss Catharine Justesen, Neligh, Mrs Edna C Anderson, York, Dr Rachel Long, Holdrege, Dr F W Plehn, Scottsbluff, vice presidents, H P Letton, Lincoln, is secretary-treasurer"

The Journal also carries the following item in connection with the meeting of the State Medical Society

"Public Health Week was observed in Hastings—the program arranged by the chairman of the public activities committee Speakers presented medical and public health problems

(Continued on page 1081-adv xxi)

(Continued from page 1080-adv)

to every organization in Hastings during the week

"The registration reached 315, which is good for any city, although from fifty to seventy-five short of the probable number that would have registered in Omaha or Lincoln"

MEDICAL ARTICLES IN NEWSPAPERS

The July issue of the Journal of the Medical Association of Georgia contains the minutes of the annual meeting held May 9-11 in Savannah It records a brief address of Dr E W Patton, of Chattanooga, the official visiting delegate from Tennessee, who said

"Some of us have felt that the profession was not doing its whole duty to the laity, that we are lacking in that we have not allowed the laity to keep up with us in matters of medical You know how many of the newspapers are carrying articles by doctors all over the country New spaper men tell us that these articles are eagerly sought by the laity, and that we are derelict if we do not take part in them At our last meeting we adopted a measure that has been used successfully by W1sconsin for two years The Secretary is empowered to ask any man he may wish to write articles on popular lay topics, then a lay editor is given an opportunity to put this information in language that can be understood by the lay public, and it is then returned to the Secretary so that he may see that the meaning has not been lost in the editing. No man's name is connected with it, and there is no chance of any one using it as propaganda. It all comes from the State Association, and we feel that it will be a wonderful help It is certain that if this is not done by reputable physicians, men who do not have a high sense of medical ethics, and perhaps small knowledge of medical matters will, for the price paid, write articles for the publications I have been told that a man in New York recently turned down an offer of \$2,500 for a single article for the American I hope the State of Georgia and others will adopt a similar plan, for it has worked successfully in Wisconsin and we are going to try it out. It is not an expense to the association, the only expense is to the lav editor, and is a small item "

DOCTORS IN RURAL COM-MUNITIES

The question of medical service in rural communities is receiving consideration all over the country, and was discussed in the annual meeting of the American Medical Association Concerning that meeting the Teras State Journal of Medicine, in its July issue, comments as follows

"The Scarcity of Doctors in Rural Communities received rather unusual and extended consideration President Dr Jackson acknowledged the existence of a shortage of the sort, but insisted that there were ample economic reasons therefor, and that the medical profession could not be blamed and could not be expected to correct the situation at once He pointed to the fact that the source of income to the medical profession through a large variety of diseases such as typhoid fever and malaria had helped to drive doctors from rural to urban communities This being purely an economic problem, the doctor must serve where he can receive a living income, and one comparative to the dignity of his position in the community He must either have a wider territory or a denser population to serve, and one in which there is money The cost of medical education in both time and money, requires that. The tendency of the time is to resort to the specialist at once, when there is an illness coming under his specialized service. That reduces the doctor to a status comparative to that of the broker in business He distributes the patients to the specialists the general practitioner upon whom the rural community must depend for service

ROSS SANITARIUM Inc.

Brentwood, L. I., N. Y. Telephone, Brentwood 55

An ideal place for convalescent, semi invalids and those needing rest and quiet. ¶ Resi dent medical and nursing staff 1 Delightful homelike surroundings. I Good food. I Rooms with and without bath. Rates \$3500 to \$75 00 per week.

An ethically conducted sanitarium established thirty-one years

W H. ROSS, M.D., Medical Director

HOMES

For convalescents or those who wish a more permanent establishment Fully equipped, nursing and domestic service

SOME FACTORS IN THE INFANT MORTALITY PROBLEM*

By CHARLES HERMAN, M D., NEW YORK, N Y

ROM the standpoint of health 1927 was a record year The death rate in infants under one year in New York City was less than 56 per thousand births Chart 1 Even more remarkable that in the Boro of the Bronx was less than 41 per thousand If we consider this Boro with its one million inhabitants as a city, it would have the honor of having the lowest infant mortality rate of any large city in the world Although the greater part of this splendid result may fairly be considered as due to infant welfare activities, other favorable factors must also be mentioned The Boro of Manhattan which has a rate about fifty per cent higher, has a less homogeneous population, certain nationalities whose rates are above the average are more fully represented, and more than ten per cent of the population are colored

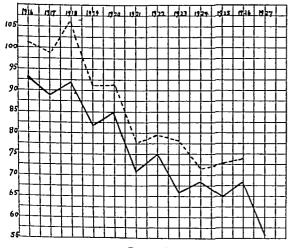

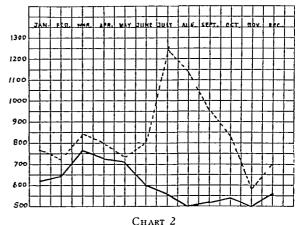

CHART 1
Infant mortality under 1 year 1916 to 1927 Dark line
in New York City Dotted line in U.S. Reg. Area

The curve of infant mortality has changed radically during the last twenty years Chart 2. The highest point is now reached in the spring,

and summer is the healthiest time of the year for infants. There has been a marvelous reduction in the deaths due to digestive diseases, which as the weather conditions have not changed, must

Infant mortality under 1 year Dark line -New York City 1927 dotted line - Vew York City, 1910

be attributed to an improved milk supply, and the education of mothers in infant feeding and hygiene. The infant mortality in the spring of 1927 was relatively low, because infectious catarrhs, and especially measles were not prevalent. If we take a series of years, we find that the mortality during the spring months has been only slightly reduced. However this must be recognized as a relative gain, since formerly weak infants who were born in the summer and died of digestive disturbance, now survive and often succumb to respiratory infections the following spring.

In Chart 3 showing the causes of death in infants under one year in the U S Registration Area, the deaths from digestive diseases are still greater than those from respiratory diseases. However during the last three years the former have been still further reduced, and a large proportion of the deaths attributed to influenza, measles and whooping cough are really due to the complicating pneumonia. In almost all sta-

^{*}Read before the American Pediatric Society Washington May 1 1928

tistics the number of deaths attributed to cerebral hemorrhage, tuberculosis, syphilis, and pneumonia are too low, those to congenital malformations, more especially those of the heart, too high. Unfortunately in the respiratory diseases we have no certain means of controlling the infecting

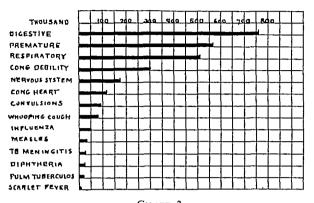

CHART 3

to 1923

medium, the air From the day of birth, infants are highly susceptible to infectious catarrhs and to whooping cough Chart 4 Fortunately in large centers of population, infants under five months are relatively immune to measles, but toward the end of the first year of life, it becomes

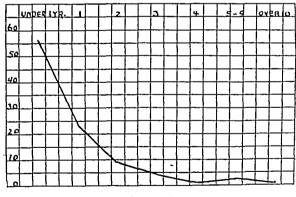

CHART 4

And distribution of deaths from schooping cough U S

Reg Area 1910 to 1913

a very serious disease, Chart 5 so that the death rate is even higher than it is during the second year. The prevalence of measles determines the number of deaths from bronchopneumonia. Between the curves of measles and bronchopneumonia there is a parallelism which is not present in the other communicable diseases. Chart 6 Although certain climatic condition with their effect on the susceptibility of the individual favor the devent of both infections, the effect of measly the prevalence of catarrh as

shown in Chart 7, for in 1926 with measles epidemic we had a large number of deaths from bronchopneumonia, while in the spring of 1927 with very few cases of measles, the deaths from bronchopneumonia were also few. I believe that this susceptibility of young infants to respiratory infections is not due to anatomical peculiarities, but is biologic. Breathing by means of lungs, the development of the respiratory tract from the endoderm is a later and therefore younger structure from the evolutionary standpoint, and less able to cope with unfavorable extrauterine conditions

There has been little or no reduction in the death in early infancy. At present it is very difficult to compare the causes of neonatal deaths as given by different observers, so that there is urgent need for a standard classification. Prematurity and congenital debility are only predis-

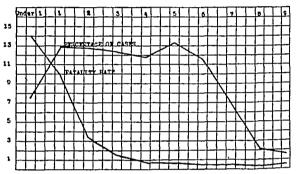

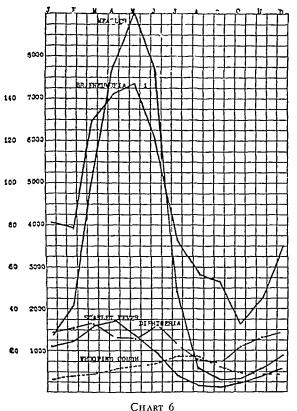

CHART 5

(Crum)

posing causes As more and more women are being delivered in institutions where there is every facility for careful examination and accurate diagnosis, together with autopsy control in a large percentage of deaths, it ought not be difficult to determine the real causes of neonatal It will probably be found that many deaths recorded as due to prematurity and congenital debility are really associated with pathologic changes, syphilis, pneumonia, atelectasis, or cerebral hemorhage Environmental factors have little influence on neonatal deaths, for they have These deaths depend prinot had time to act marily on the character of the stock, and due to some defect in the germ cells If the defect is extreme it results in an abortion, miscarriage or stillbirth, if less marked the newborn may be viable but so inferior in quality that it succumb shortly after birth or in early infancy. It migh be better to use the term congenital interiority rather than debility, because the latter suggests ar acquired weakness, whereas it is usually present at the time the ovum is fertilized Under similar environmental conditions the deaths in early infancy vary in different races and nationalities Chart 8 The superior viability of those of better stock continues to manifest itself in a lower death rate from digestive and respiratory diseases throughout the first year Some years ago Chapin pointed out that the death rate in infants in New York City was lower in certain poor and con-

gested districts on the lower East side of Manhattan than in certain well-to-do districts on the upper West side

The limitations of prenatal care should be recognized Care of the mother during pregnancy and better obstetrics will reduce the neonatal deaths due to syphilis, prematurity, the toxemias of pregnancy, and many of the accidents and injuries of labor, but there still remain a large number of miscarriages, stillbirths, premature births and neonatal deaths which cannot be prevented by any method now at our command, because as yet we have no certain and safe means of directly influencing the developing ovum New Zealand, Chart 9, partly on account of a favorable climate and a large percentage of parents of English stock, the infant mortality from digestive and respiratory diseases is very low. However notwithstanding a certain amount of prenatal care, the deaths in early infancy have not Leen reduced The slight reduction during the last few years is more apparent than real, for it will be noted that the deaths attributed to malformations has increased. This is probably due to more accurate diagnosis of anomalies by means of roentgenographic and autopsy control.

NEONATAL DEATHS

Deaths from measles (dark line), and bronchopneumonia (dotted line), New York City, 1926 and 1927

In the above table the causes of neonatal deaths as recorded by Holt (based on 10,000 consecutive births at the Sloane Maternity), in the entire City of New York, and at the Maternity Center, are given As we should expect the rate for the city is somewhat higher The Sloane Maternity with better obstetrics, has a lower rate for the accidents and injuries of labor, and on account of greater facilities for accurate diagnosis, a smaller percentage of deaths in which the cause With the addition of prenatal was unknown care there is no doubt that its rates will be dim-The low rate for prematurity in the ınıshed Maternity Center group is due to prenatal care The higher percentage of malformations in the city as against institutions is only apparent, since

prenatal care can have no influence on such anomalies. It is probably due to the tendency to consider cyanosis as a symptom of congenital heart disease, when in reality it may be associated with cerebral hemorrhage, at electasis or pneumonia. If we consider what portion of the neonatal deaths may be prevented, we find that even if all the deaths due to syphilis, accidents, injuries of labor, asphyxia, at electasis were eliminated, there would still remain about 20 per thousand births which could not be prevented by any means now at our command. With a neonatal death rate of twenty, it would be possible to obtain an infant mortality of 50 per thousand births.

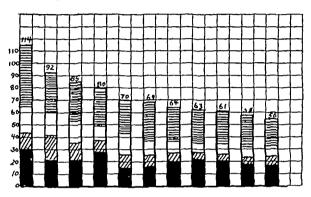

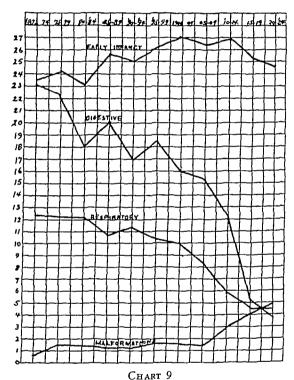

CHART 8

Infant mortality by color and country of birth of mother U S Reg Area, 1924 In order of columns (1) Negro, (2) Polish, (3) Austr, (4) Canad, (5) Ital, (6) Ire, (7) Ger, (8) U S (9) Brit (10) Scand, (11) Rus The markings from the bottom up indicate early infancy, digestive, respiratory, all other

That the death rate among breast fed infants is decidedly less than among artificially fed infants is beyond all doubt. To determine just how much is due solely to the character of the food, is not It is not sufficient to compare a group of breast fed with an equal number of artificially fed, even if they are of the same age, nationality and social position A mother who nurses her baby successfully gives it something more than Her infant receives not only a subreast milk perior food, but it inherits favorable unit factors which have a distinct survival value of only one way in which the exact degree of superiority of breast milk could be conclusively If one of duplicate twins was given breast milk and the other cow's milk, the environmental conditions remain the same for both, it would be fair to assume that any advantage in growth, development, and in reaction to infections was due solely to the superiority of the food Perhaps some enthusiastic pediatrician will be able to carry out this experiment

Writers on infant mortality have usually stressed the importance of such factors, as occupation of the father, income, number of rooms, rental, working out of the mother Ethel Elderton has called attention to a very important

distinction between caused by and associated with, and has shown by refined statistical methods that a high infant mortality is not necessarily caused by, but rather associated with some of these fac-It was not an accident that Franklin in his well-known couplet linked together "healthy, wealthy and wise", for these are correlated and usually associated with good habits, industry and intelligence If we except a few unfortunates, poverty is usually found with ill health, bad habits, or lack of industry and intelligence From my own observations in the poorer districts of New York, I should say that the infant mortality among the offspring of parents physically, mentally and morally defective cannot be reduced by providing a dole As stated previously in some of the poorest districts with imperfect environ-

Infant mortality under 1 year, New Zealand, 1872-1924

mental conditions the death rate is below the average

The personal equation All men are not born physically, mentally or morally equal If there are no two individuals with finger prints exactly alike, what an enormous number of combinations are possible with so many different parts. It has been shown that differences can be detected in infants a few days old. As most of our present methods are crude and inexact, the personal equation still contains many unknown quantities, but as our knowledge increases and new instruments of precision are devised, it will become possible to determine the equation with more and more

accuracy Even at present we have some exact methods and measurements, functional and intelligence tests, so that it is possible to examine, score, and determine the individual's standing physically, mentally and morally

The human body is not like the celebrated "One Hoss Shay" of Oliver Wendell Holmes, it does not go to pieces in all parts at once Each individual has a weak spot, a sort of Achilles heel This congenital, inherent point of least resistance, or lack of vital endurance may not manifest itself for years, so that ordinary tests are successfully met, but depending on the degree of inferiority sooner or later it will show itself unequal to the task. The various organs and systems are so inter-dependent that a functional inefficiency of one organ is sufficient to upset the perfectly harmonious action of other parts, so that deterioration and eventually death results

Summary

- 1 From the standpoint of health 1927 was a record year The infant mortality under one year in New York City was less than 56 per thousand births, that of the Boro of the Bronx less than 41 per thousand
- 2 The curve of infant mortality has undergone a radical change. The highest point is reached in the spring, the lowest in the summer
- 3 Epidemic catarrh, measles, and whooping cough are the chief exciting causes of respiratory infections, and have not been controlled to any great extent
- 4 There has been little or no reduction in deaths in early infancy Environmental condi-

tions have very little influence on neonatal deaths, which depend primarily on the character of the stock, and are largely due to some defect in the germ cells. An extremely defective embryo does not mature and results in an abortion, miscarriage or stillbirth. One less defective may be viable but being of inferior quality the individual dies shortly after birth or in early infancy.

- 5 Under similar environmental conditions, deaths in early infancy vary with the race and nationality of the parents, that is with the character of the stock. This also determines to a great extent the number of deaths during the rest of the first year.
- 6 The limitations of prenatal care should be recognized. Care of the mother during pregnancy and better obstetrics will reduce the deaths due to syphilis, prematurity, the toxemias of pregnancy, and the accidents and injuries of labor, but a large number of miscarriages, premature and stillbirths and neonatal deaths cannot be prevented by methods now at our command.
- 7 A mother who nurses her baby successfully, gives it something more than breast milk. Her infant receives not only a superior food, but it inherits favorable unit factors which have a distinct survival value.
- 8 Ultimately the solution of the infant mortality problem, like so many of our social problems, will depend on preventing the birth of those who are defective physically, mentally or mortally
- 9 Nothing in the foregoing should be construed as a lack of appreciation of the value of improved environmental conditions

PAINLESS CORONARY OCCLUSION*

By ALFRED M WEDD, CLIFTON SPRINGS, N Y

UT of the many investigations in recent years on the general subject of cardiac pain there may be said to have come, among other things, a re-discovery of coronary occlusion as a clinical entity. It has been observed by a few authors, and these have been often quoted, that this accident may occur without pain Krehl¹ pointed out that it sometimes happened without any symptoms of which the patient was aware and that he lived for years Leyden² recognized two groups of acute coronary thrombosis, one in which the onset was with "angina pectoris" and a second, with acute heart failure. According to Vaqueza, it is rare to have pain altogether absent in coronary thrombosis It is doubtless true as Leyden stated that, although there are severe

cases which do not present the picture of "angina pectoris" but run their courses with general weakness, cardiac weakness, or pulmonary edema, perhaps in these cases there are invariably some indications of "angina pectoris" which are not striking, because the other symptoms outweigh them The literature, however, contains very few detailed examples of painless coronary occlusion. On this account, the following cases seem worthy of being reported, as they clearly show the less common, non-anginal mode of onset first instance, the patient felt slight transient substernal discomfort twenty-four hours before death but the minor pain which occurred was certainly not related to the thrombosis itself In the second case the individual had suffered from true angina, but the acute circulatory collapse, later shown to have resulted from coro-

^{*} Read before the Ontario County Medical Society at Clifton Springs N Y, April 12 1927

prenatal care can have no influence on such anomalies. It is probably due to the tendency to consider cyanosis as a symptom of congenital heart disease, when in reality it may be associated with cerebral hemorrhage, atelectasis or pneumonia. If we consider what portion of the neonatal deaths may be prevented, we find that even if all the deaths due to syphilis, accidents, injuries of labor, asphyxia, atelectasis were eliminated, there would still remain about 20 per thousand births which could not be prevented by any means now at our command. With a neonatal death rate of twenty, it would be possible to obtain an infant mortality of 50 per thousand births.

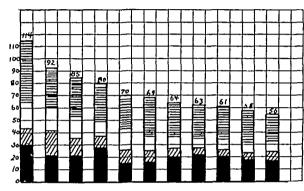

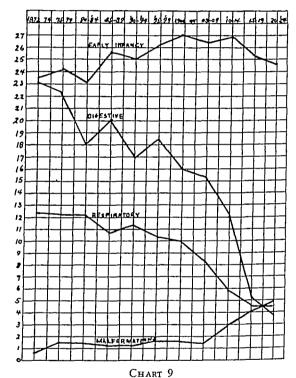

CHART 8

mental conditions the death rate is below the average

The personal equation All men are not born physically, mentally or morally equal If there are no two individuals with finger prints exactly alike, what an enormous number of combinations are possible with so many different parts. It has been shown that differences can be detected in infants a few days old. As most of our present methods are crude and inexact, the personal equation still contains many unknown quantities, but as our knowledge increases and new instruments of precision are devised, it will become possible to determine the equation with more and more

ent. Beginning at noon, vomiting occurred at frequent intervals and he rapidly became weaker At 6 P M the blood pressure was 80-40 His mind was clear and he felt stronger Forty minutes later death occurred following an attack of vomiting

Necropsy was performed at once The heart, with the aorta and some mediastinal tistue, weighed 900 gms, the increased size being due to hypertrophy of the left ventricle. There were old pericardial adhesions but no recent pericarditis. The left border of the left ventricle was rounded and the upper portion of firm consistency. Anteriorly, beginning just to the left of the interventricular septum was a triangular zone, 3 cm. in width at the upper

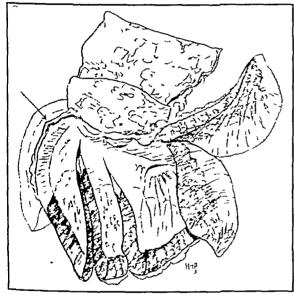

Figure 1

A drawing of the heart of Case 1 The shaded portion indicates the area of infarction. The arrow points to the site of occlusion.

portion and 45 cm at the apex of the heart, which was of brighter red color than the adjacent muscle and to the touch felt soft and Just above the apex, the surface was flattened and somewhat depressed revealed a greater area of softening than was indicated by the surface changes The wall of the left ventricle was 25 cm thick. Where it felt soft, the cut surface was dull and lusterless, and of mottled reddish-brown color Softening was more marked at the apex vertical incisions on the left ventricular side of the interventricular septum showed an upward continuation of the infarcted area to a point 15 cm from a sharp angulation of the left coronary artery This angulation occurred 2 cm from the mouth of the vessel and the narrowing of the vessel was further increased by the presence of a heavy calcareous plaque

In the lumen at this point was a small irregularly cylindrical plug or soft fibrin-like material which had completely occluded the vessel and was responsibe for the infarction previously described. The infarcted area also extended downward to the apex of the right ventricle. The left coronary artery contained many calcareous deposits throughout its course, and to palpation felt like a string of small beads. The intima showed extensive chronic nodular endarteritis, with atheroma. The right coronary artery showed changes of similar kind but of less advanced degree.

The tricuspid and pulmonary valve cusps were normal. The mitral orifice was stenosed, being 9 cm in circumference, and the cusps were uniformly thickened. The aortic cusps were thickened, especially the posterior one,

and incompetent

The ascending aorta showed aneurysmal dilation. Just above the aortic valve were many hard brittle plaques. The intimal surfaces showed superficial atheromatous areas. A few small puckered scars were visible, but in the gross, the arterio-sclerotic changes obscured the syphilitic. Microscopic study showed the presence of well-defined syphilitic mesaortitis.

There were no other findings of interest save the presence of free fluid in the pleural cavities, 400 cc in the left and 100 cc in the right. The liver was somewhat congested but of normal weight. The kidneys were practically normal.

The second patient was a physician seventyfour years of age who came to Clifton Springs on March 31, 1927 Just one year before that date while attending a patient, he suddenly collapsed, but did not lose consciousness. He suffered from great air hunger, stating that he struggled to breathe There was profuse sweating and later, vomiting The accident, however, was entirely without pain. He was taken to a hospital where it was found that his systolic blood pressure, normally 140 mm, had fallen to 118 mm After a week there he returned home and rested in bed for two months, following which he resumed his work He was short of breath on evertion and often had severe dyspnea after several hours of office work, but he did not become incapacitated until six weeks before coming to this hospital

For a short period, about forty years before the recent trouble, he suffered from attacks of substernal and precordial pain which were attributed to true angina pectoris. He was entirely free from pain until four years ago when typical anginal attacks recurred. They usually occurred after meals. The last painful seizure was experienced in February, 1926, six weeks before the severe circulatory accident that has been described. It has been em-

nary thrombosis, was entirely painless and because of the absence of pain, coronary occlusion was not suspected by his physician. Moreover this man experienced no further cardiac pain during the remainder of his life. The complete cessation of pain following coronary occlusion is frequently observed. Mackenzie has pointed out that following the development of auricular fibrillation, anginal symptoms usually disappear, and Wenckebach has emphasized that "what damages the heart muscle wards off angina." It would seem that this phenomenon should receive more attention by those who would explain the mechanism of cardiac pain.

Allbutt has utilized these cases of painless coronary occlusion to further his argument in favor of the aorta, in opposition to diseased coronary vessels, as the site of origin of angina pectoris. In the first case presented, there was found syphilitic aortitis and extensive intimal aortic arteriosclerosis, chronic myocarditis, advanced coronary sclerosis with calcification and thrombosis, resulting in infarction of a large area of ventricular muscle, and myocardial failure, in fine, every structural and functional change that has ever been suggested as the underlying basis for pain, and yet pain was strikingly absent.

The patient was a commission merchant 58 years of age His general health had always been good, he had had no serious illness and no reason to suspect the presence of cardiovascular disease He was married were no children in the family In 1913, a cyst was removed from the right frontal sinus and a second operation was performed in November, 1923, because of recurrence Following that, according to his wife, he had been very nervous and crying spells often occurred on slight provocation As the operative wound did not heal, the patient frequently reported at the hospital On the afternoon of January 23, 1924, the wound was dressed The following morning about four o'clock, he awoke and said that he was dying, dyspnea was extreme, there was profuse sweating and the color was described as "ashy" The administration of aromatic spirits of ammonia, and soda gave re-The attack was attributed to indigestion He remained in bed until noon of that day and then went about as usual On January 29th, it was observed that he was very short of breath on going upstairs and throbbing of the neck was noticed for the first time following afternoon he again came to the hospital Just after a small dressing had been applied to the wound, the patient collapsed, supposedly from acute dilatation of the heart

The patient was taken to the ward where he was examined at 4 15 P M He was propped up in bed suffering from extreme

dyspnoea, and using all the accessory muscles of respiration to alleviate the air hunger At first, pallor was striking, later he became cyanotic The pupils were dilated and unequal, the right being larger The jugular veins were engorged There was forceful pulsation of the carotid vessels The heart was enlarged to both left and right At the apex there was a systolic murmur which was transmitted to Over the manubrium, systolic and diastolic murmurs were heard. The heart rate was 144 per minute and was subject to vagal The blood pressure was 210 mm. systolic and 55 mm, diastolic There were rales at the bases of the lungs and the liver edge was just palpable Strophanthin and morphine sulphate were given subcutaneously

At 4 45 P M the heart rate was 174 skin was moist Respiration was irregular He complained of thirst By 5 30 P M the rate had fallen to 130 The pupils were smaller and respiration was regular. Morphine and strophanthin were again given and the patient passed a fairly comfortable night. The next day, January 31st, the rate was 104, blood pressure, 170-50. The general condition was much improved On February 1st, the heart rate was 120 when quiet, but on talking or slight exertion it increased to 140 The blood pressure was 160-40 The pupils were small and equal The reflexes were exaggerated, the plantar response was normal The specific gravity of the urine was 1020, albumin was present but no casts The blood Wassermann reaction was strongly positive. A teleroentgenogram gave the following cardiac diameters MR, 51 cm, ML, 135 cm, aorta, 92 cm, the cardio thoracic index was 070 The electrocardiogram showed deep inversion of T₁ and T₂ Certain ventricular complexes of the third lead suggested the muscle injury curves seen in coronary occlusion, but were not definite, partly because of respiratory movements. This record was also modified by the strophanthin and 5 cc of tincture of digitalis which had been given previously The day was passed in comfort and with considerable improvement

Suddenly during the night of February 1st, the patient became much worse. The pulse rate fell to 64 and there was excessive sweating. For a short time, he was conscious of substernal discomfort, a sense of constriction at the level of the fourth rib, together with slight precordial pain. This was the only painful sensation experienced and it continued for about one half hour. On the morning of February second his general appearance showed conspicuous change. The eyes appeared sunken. The color was ashen, but there was no increase in cyanosis. The blood pressure was 105-45. Cheyne-Stokes respiration was pres-

occluded by a gray granular, laminated thrombus which extended over a distance of 5 mm The clot was closely adherent to the vessel wall and the intima at that point was absent The area of myocardium supplied by that artery was not softened The right coronary artery was also thickened and tortuous, but its lumen was patent throughout The intima of the base of the aorta showed numerous yellow streaks The kidneys were normal

SUMMARY

Two cases of coronary occlusion and ventricular infarction in which the onset was characterized by shock and cardiac weakness but absence of pain have been recorded ample of "angina pectoris" fatal in the first attack and its relation to coronary occlusion has also been described

STUDIES OF THE RELATIVE INTENSITY OF DISTRIBUTION OF THE RAGWEED POLLEN DURING A PERIOD OF THREE YEARS*

By SALVATORE J PARLATO, MD., BUFFALO, N Y

T has been generally accepted that the great majority of cases of autumnal hay fever and asthma are caused by the inhalation of the pollen of both the giant and small ragweeds The syndrome known as seasonal hay fever or pollinosis is a manifestation of hypersensitiveness of the individual to the pollen which he is exposed to when the plant is in bloom. The most approved method of treatment has been to produce hyposensitization by administering hypodermic injections of the pollen extract before the onset of symptoms (preseasonal or prophylactic) and also

during the hay fever season The results of this specific therapy have not altogether been uniformly good in the hands of the general practitioner Some have tried it, were not satisfied and soon discarded it Others still feel that it is something which has not yet emerged from the experimental stage and so they continue to use various palliative treatments has occurred to me that in order to handle this problem more effectively, it would be necessary to obtain more data about the ragweed pollen, particularly in and about the city or town where one practices Since the pollen of these two ragweeds causes at least 85 percent of autumn hay fever, the need of becoming thoroughly acquainted with this weed and its pollen becomes self evident. As Chamberlain states in his recent paper1 "Greater attention is being given to a more careful and complete study of the hay fever plants and pollen distribution in various localities"

Among the few workers who have made such studies are Scheppegrell in New Orleans2, Koessler and Durham in Chicagos, Durham in Kansas City, Missouri and Robert A Cooke in New York City 5

*From The Buffalo Eye Ear Nose and Throat Infirmary—Wettlaufer Clinic.

I have completed a botanical survey of Buffalo, its suburbs and neighboring parts of Canada but I shall only undertake here to present the most important observations which have proved helpful in obtaining better results in the treatment of The studies of the relative ragweed pollinosis intensity of pollen distribution of both the giant and small ragweed were made during the summer and fall of the years 1925, 1926 and 1927

As the ragweed pollen is readily carried by the wind even for the distance of 5 or 6 miles, it can be collected on glass slides or plates set up For one of these sites, the at suitable places tower of the Liberty Bank Building was chosen because of its central location and its height (325) feet from the street level) which permitted free

exposure to the winds

The following method was used for collecting the pollen Two ordinary glass slides measuring 3 inches in length and 1 inch in width were stood up in a specially constructed contrivance which had a slot whose diameter was a trifle greater than the width of the glass After being smeared on one side with boiled linseed oil, one slide was set up in the slot, facing the wind and the other facing in the opposite direction Should the direction of the wind change after they were so arranged, the glass slides would swing around so that one of them would always be in the path of the wind The whole apparatus was weighted so as to avoid damage by the wind and rain. The U S Weather Bureau reports were daily consulted and used as a guide in this work

I found that the prevailing wind was the southwestern and that it carried the most pollen The greater the rainfall, the more marked was the drop in amount of pollen in the air The slight changes in temperature and velocity of the wind which occurred had very little effect on our

readings

phasized that this attack was not accompanied by any pain, nor was pain experienced at any time during the following year. There was nothing else significant in the past history except chronic indigestion and occasional "bilious attacks." The doctor, a country practitioner, said that during his active career he had done the work of three men

The physical examination revealed a large heart, the heart sounds were of fair quality, without murmurs or abnormal accentuations. The rate varied between 80 and 100 per minute. The blood pressure readings were normal, 130 to 145 mm, systolic and 80 to 90 mm diastolic. There was marked sclerosis of the peripheral vessels. All the signs of myocardial insufficiency were present general anasarca, with gross edema of the legs, thighs, and back, cyanosis, congestion of the lungs, liver and kidneys.

During the last week of life the patient suffered greatly from dyspnea Rest could be obtained only by opiates There was progressive retention of fluids and mild uremia developed On the morning of April 7, he died with symptoms of acute pulmonary edema

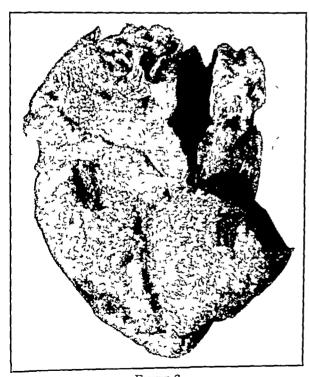

Figure 2

A photograph of the heart of Case 2 Description is given in the text

The heart weighed 400 grams The pericardial surfaces were smooth A large area including the left anterior surface and extending to the apex of the left ventricle represented

a healed infarct. The muscle tissue in this area was of a lighter brown color, definitely softer and more homogeneous than the myo cardium elsewhere The wall of the aper of the left ventricle was 5 mm in thickness Throughout this area was extensive white fib rous tissue formation This is well shown in the accompanying photograph, a section has been made through the old infarct and the anterior surface turned back. At a point 08 cm from its mouth was a calcified ring where occlusion of the main left coronary artery had The artery was blocked for about occurred 3 cm below this point and had been practically converted into a fibrous cord There was extensive endocardial and subendocardial fibrosis throughout the left ventricle and the interventricular septum An irregular thrombotic mass was present in the apex of the right ventricle The mitral and aortic valves were somewhat thickened

The first portion of the aorta was thickened and there were numerous plaques. In the abdominal portion there was extensive calcification.

In the right lung were three distinct infarcts, and there was one in the lower lobe of the left lung

The gall bladder was constricted in the midfundus region, and contained a mass of stones

and precipitated bile salts

The clinical diagnosis of coronary occlusion, whether there be pain or not, rests on the appearance of signs of myocardial insufficiency, the first of which is usually air hunger pain attending coronary occlusion is often no more severe than that which occurs in attacks of "angina," so that it is not until there are signs of congestive heart failure (or a pericardial friction rub is heard) that the real The diagnature of the trouble is revealed nosis can be made with greater certainty when the symptoms, either severe pain or acute cardiac weakness, occur unexpectedly in one Doubtless inthought to be in good health creasing experience will show that the majority, if not all cases of "angina pectoris" that terminate fatally in the first attack are in reality due to coronary occlusion. An example of this type will be described briefly

A physician thirty-eight years old, who, as far as could be learned from his friends, had been in excellent health, fell on the street in an attack of severe substernal pain and was carried to a drug store where he died a few minutes later. He was a very large man, weighing 235 pounds. The heart weighed 375 grams. The left coronary artery was thick walled, tortuous and presented many fatty streaks, and beneath the intima were numerous fibrous plaques. At a point 66 cm from its origin, the artery was very narrow and was

Vol. 28, No. 18 September 15, 1928

of pollen extract for each patient can thus be more carefully calculated In this way only, the process of hyposensitization can be made more effective and the results of our treatments prove much more satisfactory

THE MEDICAL SOCIETY'S SHARE IN PROTECTING THE CHILDREN OF SCHENECTADY AGAINST DIPHTHERIA*

By HOWARD A. GILMARTIN, MD, SCHENECTADY, NY

S Secretary of the Diphtheria Committee of the Schenectady County Medical Society, I hope a preliminary report of that Committee will be of interest to you In previous public health campaigns, undoubtedly some methods of procedure used by medical and lay organizations have been responsible in a large measure for what might be considered a lack of cooperation on the part of the Medical Profession Schenectady a unique campaign has been at work, first to immunize the pre-school group against diphtheria and, secondly, to coordinate organizations interested in public health work, collect data and try to develop a plan of campaign based upon principles which could be applied in any com-In spite of all scientific knowledge regarding diphtheria, the average death rate for the past ten years has remained approximately the same Medical leaders in public health work have for some time advocated reaching the group where the mortality is highest, namely, the preschool group

While Dr Charles Gordon was Chairman of the Committee on Public Health and Medical Education of the State Society, that Committee advocated a definite plan of campaign, and selected Schenectady for the demonstration

Our local health commissioner had just organized a committee for a Diphtheria Campaign in conjunction with the state-wide movement However, he immediately so directed his activities to

cooperate with the proposed plan At the regular April, 1926, meeting of the County Medical Society, a resolution was offered to form a committee of eight members representing the Medical Society during the period of the Anti-Diphtheria Campaign This resolution provided, first, a means of assuring the cooperation of the Medical Profession and supplying aid and advice to any or all organizations responsible for the active conduct of the campaign Secondly, to collect data pertaining to all phases of the

work, especially the social, psychological, financial and organizational factors involved

The first meeting of the Diphtheria Committee was held in April, 1926, and a program was arranged, based on the essential points advocated by the Committee on Public Health and Medical Education This program called for a three-year campaign divided into three stages with special emphasis on the pre-school group All cases during the first stage were referred to the family The establishing of a clinic marked the beginning of the second stage, at which time the parent had an opportunity to have the immunization given gratuitously by the family physician or at the Health Center The third stage will be in the nature of a "round-up" or an attempt to reach as many as possible of the pre-school children who still have not been immunized

The Girl Scouts within a comparatively short time copied over 8,500 names of the pre-school Duplicate cards were made from this list containing the name and address of the parent, and the name and age of the pre-school children in each family The white cards served as a permanent office record, filed alphabetically, and the yellow cards were filed according to street and district for the nurses' record

The City is divided into eight school districts and a nurse from the Department of Health covers each district, making contact in conjunction with her regular line of duty She was requested to note on the card the reaction of the parent If in favor of immunization, they were to sign the white card giving the name of their family physician, if opposed the nurse ascertained the reason The obviously poor were advised regarding diphtheria prevention, listed for the clinic. and these cases were notified when the clinic The Public Health Nursing Association made contacts and gave publicity throughout the County similar to the City plan

It was decided to send one nurse into a district to gather statistics and also information needed to definitely instruct the other seven nurses

^{*}Read at the Annual Meeting of the Medical Society of the ate of New York, at Albany N Y May 22 1928

The characteristic size and shape of the ragweed pollen enable one to readily identify it Lugol's solution as a stain was used in cases of some doubt in identification. In order to secure an accurate count, twenty-five consecutive low power fields of the microscope were examined and the total number of pollen counted in these spaces was recorded as the relative amount for that day. The plates were changed daily

In all, nearly 500 pollen plates were collected and examined and the number of pollen grains The results of these tabulations are shown in the accompanying charts The latter reveal many interesting facts They have disproved the popular but erroneous idea as to the time of onset of the hay fever season patients will tell you that their symptoms commence regularly each year on a specified day of August It may be anywhere from the first week in August to the 2nd or 3rd of September Naturally one would think that the pollen makes its appearance in the air on that particular day They will also tell you that their hay fever subsides during the latter part of September and attribute it to the coming of the first frost glass slides showed that ragweed pollen gets into the air as early as the 26th of July and this was confirmed by visiting various parts of the city where the weeds were found in full bloom. However, the amount of pollen was comparatively scanty until the latter part of August The charts show that the time when a substantial amount of pollen gets into the air varies from year to year, maintains a high level for about 15 to 20 days and then there is a distinct drop observations coincide clinically with the symptoms of a patient whose degree of suffering is dependent upon the amount of pollen in the air The subsidence of symptoms which usually occur during the third week in September is not caused by any frost because the Weather Bureau has reported none during September of any of these three years On the other hand, when one returns to the fields, he will find that the ragweed has finished pollination and has completed another step in the propagation of the plant

In the year 1925, the amount of pollen in the air was small an insiderably less than that of the last twent by the pation of the light season are been was confirmed clinically by the pation of the light season are been with slight symptoms. But in 1926, was distinctly greater. In 1927, there was a comparatively late start, undoubtedly due to the frequent rainfalls during August. But once pollination set in, there was a greater quantity of pollen thrown into the air During these three years, it was remarkable to see that with the rise in the pollen count, there corresponded an increase in the number of patients who came for treatment for the first time

When the physician realizes that the extent of symptoms is directly proportionate to the degree of hypersensitiveness and to the amount of pollen in the air, he can readily appreciate the ineffectiveness of administering the treatment according to any particular set of rules or directions The intradermal and ophthalmic tests with pollen extracts made according to the method of Coca and Milford have proved of the highest value in diagnosing our cases By using extracts of varying concentration as indicated by their nitrogen content, one can determine the extent of hypersensitiveness and classify the cases according to their reactions I have correlated these findings with my daily pollen counts. Through such means, I have truly individualized the treatment for each patient. The size and number of dosages were arranged according to the amount of pollen in the air When the count was high, I gave increasing doses at shorter intervals, sometimes daily for two or three successive days This method has proved particularly successful in our new cases who came for treatment after the hay fever season had started pollination subsided as shown by the low count of our glass slides, the dosage for each injection was correspondingly decreased and the interval between treatments was lengthened By following this method, one can avoid the mistake of giving an inadequate amount of extract which produces insufficient hyposensitization to the pollen and consequently the results as measured by the relief of symptoms, will be unsatisfactory Then again, one can also avoid the error of too large a dose with its sudden and even alarming constitutional reactions

Summary

1 Studies of the ragweed pollen made in Buffalo and its vicinity during the years 1925, 1926 and 1927 have shown that the relative amount of pollen found in the air varies from one season to the other and also from day to day during the same season, depending upon the prevailing wind, the amount of rainfall and other meteorological factors

2 There can be no fixed date as to the onset of the hay fever season because the period of time when pollen is found in the air in sufficient quantities to produce symptoms, varies from year to year. This fact should emphasize the importance of preseasonal treatment, especially the perennial method as proposed and used by Aaron Brown.

- 3 The severity of hay fever symptoms is dependent upon the degree of the patient's hypersensitiveness and the amount of pollen which is found in the air as recorded by daily pollen counts
- 4 By correlating this data, one obtains a greater insight into the activity of the ragweeds and their pollens, the biggest factor in the etiology of fall hay fever. The dosage of every injection

John Hancock Life Insurance Companies, several thousand copies were printed for distribution. The Medical Society's official seal appeared on the cover page above its printed endorsement. The insurance companies' advertisement appeared on the inside of the cover page.

Through the efforts of the sub-committee a \$550 contribution was secured from the Committee on Tuberculosis and Public Health, and a \$500 contribution from the Schenectady Chapter of the American Red Cross These contributions were made to cover the expense of a direct mail program. Every parent of pre-school children received three personal letters along with a diphtheria pamphlet, the first letter reaching the parent in May and the last in July, 1927

The second stage of this campaign began June 1, 1927, with the opening of a clinic three days a week, held at the Health Center during the regular medical clinic hour. The immunization is administered by physicians receiving a salary from the Department of Health The nurses carry a blue card which reads "I am unable to bear the cost of immunization and desire the same to be given by the family physician or at the Health Center" It had been previously ascertained that approximately 5% of the cases to be immunized might be considered as "City charge cases," and the committee believes that the nurse, who is familiar with her district, is qualified to issue and certify these cards

During the vacation period, June to August, the physicians reported 77, 27 and 63 cases completely immunized For the same period the clinic reported 53, 70 and 187 cases, or a total of 169 done by the physicians and 310 done at the clinic ginning with the month of September the next seven months showed a decided increase in the number done by the physicians During that time they immunized 1,090 cases, a monthly average of 156, against the clinic's total of 157, a monthly average of 22 These figures are not particularly startling, but very significant when one considers that this average has been maintained in the absence of publicity since July, 1927, except for the nurses' contact The nurses during this seven months' period made 1,658 actual contacts This cannot be considered high pressure publicity compared to 973 actual contacts made in one month by the same number of nurses Surely the combined cases immunized by physicians and at the clinic totaling 1,247 did not all come from the 1,658 contacts made by the nurses

I do not intend to minimize the work done by the nurses, but rather to emphasize the point that some other factor has also been at work. It appears to me that the physicians of Schenectady are actively rather than passively interested, in contra-distinction to the claim that physicians in general are lethargic and indifferent to public health measures. Furthermore, one death from

diphtheria in a population of 95,000 during the past 20 months cannot be considered an alarming death rate. To substantiate the physicians' interest, a recent survey reveals that there are 117 physicians in Schenectady County, 27 of whom specialize, 7 are unable to do the work, only one claimed to be too busy to send in reports and 82, the remainder, are immunizing and rendering reports. The present rate of immunization in the pre-school group is about equal to our birth rate.

The Department of Health nurses have issued approximately 650 blue cards since the clinic opened, 550 were referred to the clinic and 100 referred to the family physician. Ten months later out of 508 received at the clinic, 485 have been completely immunized. A recent canvass of physicians shows that no parents who accepted a blue card for gratuitous service by the family physician have availed themselves of this opportunity. Throughout the county, exclusive of the city, 859 parents were interviewed, only one accepted a card and that was for the clinic, all others favoring immunization preferred going to the family physician.

Provided matters under consideration turn out as hoped, we expect to start the third stage of the campaign June 1, 1928, and continue through the vacation period. Although the details have not been definitely worked out as yet, the committee believes the physicians should be compensated for their services, but this will depend upon available funds. At this time we expect the parents to give enough information to fill in a card for statistical purposes

In behalf of our committee, I wish to acknowledge the cooperation extended to us by individuals and organizations. We fully recognize that any benefits which may develop from this demonstration will be largely due to the efforts of our local Health Officer, who made possible the organization forming the hub around which this campaign revolves. The nurses representing the Department of Health and the Public Health Nursing Association have rendered valuable service, and throughout the campaign we have not heard one word of criticism regarding the manner in which they have handled their work

The executive secretary of the State Medical Society has expressed his interest in the campaign by meeting the members of the diphtheria committee in conference from time to time, and offering suggestions, which have been extremely valuable

In conclusion, the opinions as to the success or failure of our efforts are undoubtedly divided, and will depend upon the value given by different individuals to the different factors in the situation. If success is to be measured by the number of children immunized by revival meeting methods, then we have failed. On the other hand, we have in Schenectady an alert medical profession always on the lookout for diphtheria, actively interested.

before starting their canvass This nurse in a very short time made 632 visits and found that 291 had moved, were not at home, or the children were attending school leaving 331 actual con-Of this number 114 were in favor and would either consult the father or their physician, 149 signed to have it done by their physician, 4 refused and 3 were obviously poor The mother's were interested in the cost of immunization when informed that it would require three This seemed to be . visits to the doctor's office a problem which required immediate attention and at the May, 1926, Medical Meeting a resolution was offered providing for a uniform fee of \$500 for three injections for one child, \$700 for two children and \$900 for three or more This fee was not intended to interfere with the physician's private practice and only applied to office calls in those cases of limited means which were referred by the nurse with that understand-However, with very few exceptions the physicians adopted this fee and applied it to practically all of their cases

The Committee was particularly anxious to enlist the interest of the Medical Profession, then lay organizations, and finally prepare a publicity program. The first attempt made to interest the medical profession was in the form of a dinner given May, 1926, to Dr. Joseph Regan, who came from Brooklyn to talk to the physicians on the subject of Diphtheria and Its Prevention, 79 doctors attending this dinner. Since then their interest has been maintained by regular circular letters with information concerning the activities of the Committee and the Campaign.

The Diphtheria Committee was ready to function May 1, 1926, and as originally planned, had no intention whatever of dominating the picture, but rather wished to furnish the cooperation which lay organizations interested in public health work have so long recognized as essential to the success of lay projects At this point, however, the Committee encountered its first difficulty, there being no lay organization available to assume the financial and other necessary obligations to conduct such a campaign and by force of circumstances the work has been carried on very largely through the efforts of the Medical Society's Committee and the City Department of Health, with such help as could be obtained from time to time from other organizations local Health Officer made an appropriation from his department and the nurses began their canvass August 1, 1926

During the first four months, August to November, the nurses made 4,180 visits or an average of 1,000 per month. On October 1st we began telephoning the physicians for their monthly report. The number of immunizations steadily increased from 97 to 208 per month with a total of 486 completed immunizations. On or about December 1st Schenectady experienced a sudden

outbreak of measles which interrupted our program for the next four months and from December to March, only 195 visits were made by the nurses The number of immunizations done by the physicians dropped from 486 to 235

In the meantime, plans were considered for future activities. The Committee views Diphtheria Prevention as a community problem, that is, if the people of Schenectady desire protection against diphtheria, organizations interested in public health work should advocate, organize, raise funds and then call upon the physician, the logical one to do the work, and compensate him for his service. Furthermore, the Committee believes that organizations collecting public funds, for public health work, and those companies which benefit directly from such activities should support such movements

In order to devise a means of cooperating with such organizations, a sub-committee was formed January 1, 1927, composed of one member representing each organization, such as the Department of Health, Committee on Tuberculosis and Public Health, Public Health Nursing Association, Red Cross, Welfare Department of the General Electric Company, Metropolitan and John Hancock Life Insurance Companies, and one member of the Diphtheria Committee represent-

ing the County Medical Society

The members of the sub-committee are in accord with the principles upon which this campaign is based and immediately assumed the responsibility of raising funds and giving publicity The executive secretary of the Committee on Tuberculosis and Public Health gave publicity to the campaign, according to a plan approved by the Medical Committee Although our program called for newspaper items, motion pictures, etc, we tried to avoid as much as possible the sensational type of publicity depending more upon talks by physicians to parent-teacher associations, mothers' and service clubs Articles were written for the bi-monthly news of the General Electric Company and human interest stories appeared in the daily press, written and signed by local physicians

It was found in answering questions following talks to lay organizations, that the meaning of the Schick test and toxin-antitoxin were confused in the mind of the layman Further consideration led us to believe that confusion breeds criticism and this criticism is thrust upon the Medi-Anticipating the possibility of cal Profession some other preparation being used by 1930, such as toxoid or ana-toxin, the sub-committee undertook to prepare a diphtheria pamphlet avoiding the term "toxin-antitoxin" and substituting the word "immunization", on the ground that immunization, or protection against diphtheria should be urged, but it still remains within the province of the physician to determine the method used Through the courtesy of the Metropolitan and

the purpose of isolation for group study hospital is thoroughly equipped to give X-ray therapy for cancer for we have two machines with a maximum voltage of 250,000 volts we are equipped to treat with radium having in solution two grams of radium"

Question A Will your hospital admit cases of cancer for operation in the early stages?

1 Hospitals with a bed capacity of less than Yes, 70, No, 4

2 Hospitals with a bed capacity of 100 and

over Yes, 26, No, 1

One of the hospitals in class 1 specifies that early cancer cases are admitted for operation "in private rooms" Of the three other hospitals in class 1 to which early cancer cases are not admitted for operation, one superintendent of a hospital with 20 beds writes "We do not handle any kind of cancer cases" and another writes "Our hospital is in a small village only open about 5 months in the year to accommodate local patients temporarily." This hospital has a bed capacity

The one hospital of class 2 to which early cancer cases are not admitted for operation is a hospital for incurables with a bed capacity of 118

Question B (1) Will your hospital admit late

cases of cancer for operation?

Hospitals with a bed capacity of less than 100 Yes 56, No. 15, no answer, 3

2 Hospitals with a bed capacity of 100 and

Yes 25, No. 2

One of the hospitals in Class 1 that will not admit late cases for operation limits the reply by saying that such cases are admitted "when justified " Another has already been quoted as not admitting any kind of cancer case The others make no remarks concerning their policy of not admitting late cases for operation Of the hospitals in Class 2 that will admit late cases for operation one will do so "when advisable" One of those that will not admit such cases is the hospital for incurables The other says admission "depends upon circumstances, conditions, etc"

Question B (2) Will your hospital admit late

cases of cancer for X-ray treatment?

Forty-five hospitals will admit cases for X-ray

Forty-six hospitals will not admit cases for X-ray therapy

Ten hospitals did not answer the question One hospital refers patients requiring X-ray treatment to another hospital in the same city

Question B (3) Will your hospital admit late cases of cancer for treatment with radium?

Twenty-seven hospitals will admit patients requiring such treatment, sixty-one will not admit such cases Twelve do not answer the question and one refers patients requiring treatment with radium to another hospital in the same city

As it is well known that an insufficient dose of X-ray or radium will stimulate the growth of malignant tumors, questions E and F were included in the questionnaire

If your hospital is equipped to give X-ray treatment for cancer, please indicate the character of the equipment including the maximum voltage vour transformer will give

The answers to this question are far from uni-Some institutions give the voltage in kilivolts, others in volts Some give the spark gap Only eight give the type of equipment. One superintendent says his hospital has "all modern

equipment "

Summarized Of the forty-five hospitals that will admit patients for treatment with X-rays, one is equipped with apparatus that will develop 90,000 volts, one that will develop 80,000, one 100,000, two, 110,000, three 120,000, one 125,-000, one 160,000, three 200,000, three 220,000, three 250,000 One superintendent reports 300 K V , one, 200 K V , one 100-140 K.V , one 325 K V, one 220 KV, one 131 KV Eleven state that they can give superficial treatments only The type of apparatus is reported in ten instances only Snook, 1, Victor, 2, Kelly-Koett, 3, Acme, 1, Wappler, 1, Victor-Snook, 1 One superintendent reports "Reconstructed Scheidel-Western machine giving 12-inch spark"

The hospitals that profess to give deep X-ray for cancer are situated in Albany, Broome, Clinton Dutchess, Erie, Genesee, Monroe, Montgomery, Oneida, Onondaga, Otsego, St Lawrence, Schenectady, Steuben, Wyoming and Yates Counties In thirty-eight counties there is no provision for deep X-ray therapy

Of the twenty-seven hospitals that are equipped to give radium treatment, two have 50 milligrams each, two have 65 milligrams each, 4 have 100 mg each, one has 117 75 mg, one has 136 mg, one has 225 mg and one 2 grams One has five ten-milligram needles and two ten-milligram plaques, one has fifty mg steel needles (five needles of 10 mg each) In the others radium is owned by members of the staff and is available for use in the hospital These hospitals are situated in Albany, Broome, Clinton, Dutchess, Erie, Jefferson, Monroe, Oneida Onondaga, Otsego, Rensselaer, St Lawrence, Schenectady, Tompkins, Ulster and Washington Counties In thirtynine counties there is no radium available in the

Question C Will your hospital admit cases of chronic cancer, complicated with sepsis, which require frequent surgical dressings and a comfortable place in which to die?

Forty-four hospitals will admit such cases, forty-two will not admit such cases, and the answers from fifteen are equivocal One hospital superintendent did not answer the question forty-four hospitals that will admit cases of chronic cancer represent a total bed capacity of Seven have a total capacity of 100 beds or more, the other thirty-seven have a capacity of less in reducing the mortality and constantly advising the immunization of the pre-school child. Our community is enlightened regarding diphtheria and educated to the fact that the family physician can administer this treatment at a cost within the reach of 95% of the population. If these factors are important, then perhaps our efforts have been worthwhile

THE CANCER SITUATION IN THE STATE OF NEW YORK III

The Hospital Facilities for the Diagnosis and Treatment of Cancer

By JOHN M SWAN, MD, ROCHESTER, N Y

Chairman of the New York State Committee of the American Society for the Control of Cancer

HE National Office of the American Society for the Control of Cancer is often asked for information concerning the facilities for the study and treatment of patients suspected of having cancer or of those in the terminal stages of the disease. The National Society has reached the conclusion that the facilities in the country at large for the diagnosis, and particularly for the treatment of cancer in its various stages are entirely inadequate.

The New York State Committee, which is carrying out the policies of the National Society in the State of New York, has undertaken to estimate the facilities in the State available for the cancer patient. To that end during the latter half of the year 1927 the following letter was sent to the Superintendents of the hospitals in the 54 up-state counties. The list was compiled from the Directory of Hospitals and Dispensaries published by the State Board of Charities of the State of New York in 1925. "To the Superintendent

In 1926 6,536 persons died of cancer in the State of New York outside of New York City It has been estimated that the average duration of the life of the cancer patient is three years. If this estimate be correct, there must be between nineteen and twenty thousand cases of cancer in up-State New York all of the time

The New York State Committee of the American Society for the Control of Cancer desires to make an estimate of the facilities in the State of New York for the treatment of these patients In order to obtain the necessary information, may I ask you to answer the following questions

Will your hospital admit cases of cancer?

(a) For operation in early stages?

(b) Late cases for operation?

For X-ray treatment?

For treatment with radium?

(c) Cases of chronic cancer complicated with sepsis, which require frequent surgical dressings and a comfortable place in which to die?

(d) If you admit patient in class C how many beds are available in your hospital for such cases?

Are they situated in Wards? Semiprivate

Are they situated in Wards? Semiprivate wards? Private rooms?

(e) If your hospital is equipped to give X-ray therapy for cancer, please indicate the character of the equipment including the maximum voltage your transformer will give

(f) If your hospital is equipped to treat cancer with radium, please state how much radium you own or whether you apply radium emanation

Any remarks you may have to make on the

cancer situation will be appreciated"

The letter was sent to 135 hospitals having a total bed capacity of 10,599 in a population of 4,642,388 Thirty-one of these hospitals have a capacity of 100 or more beds each, with a total capacity of 6,078 The remaining 104 hospitals have a bed capacity of less than 100 each, a total capacity of 4,521

/ Answers have been received from 102 hospitals, or 75.5%, the remaining thirty-three hospitals, or 24.5%, had not answered the question-

naire at the end of five months

In analyzing the replies it has seemed best to use 101 as the basis for calculation. The reply of the Director of the New York State Institute for the Study of Malignant Disease is published as received because that institution fills a special place in the cancer field and is organized and administered for a specific purpose

"As you probably know, we have a small hospital of 25 beds and the primary purpose is research in the treatment of malignant disease However, as we have about 1,500 new cancer cases each year you can readily see that it would be impossible for us to hospitalize them all Therefore, we do not take advanced cases but use the hospital largely for the care of patients who come here for treatment and are able to return home in a few days. We do not invite surgical cases as we do not care to compete with the general surgeon and we believe that surgical treatment has practically reached its limit. We accept cases for the treatment by X-ray or radium or both but consider that operation is useless in As mentioned above, we do not take Therefore, we have chronic cancer cases here no beds available for class C patients Our hospital is divided about equally between private rooms and small wards However, these are for

LYMPHOCYTOSIS, ITS CLINICAL IMPORTANCE*

By KENNETH R McALPIN, MD

Presbyterian Hospital New York N Y

TN discussing any of the various diseases characterized by changes in the blood, there is more than a little danger that the listeners will at once settle themselves for a This is due to the fact that anything hematological has had a tendency to call forth a veritable smoke screen of long words, some of which seem only vaguely familiar, and as one scans the face of strangers in a distant land, so one seeks in vain for some well remembered friend such as a lymphocyte Even a well developed and easily recognizable myelocyte would be welcome, but now the myelocyte is accompanied by brothers and sisters of varying ages and these are in turn called pro— and meta—, while the self respecting "Transitional" has acquired as many different names as a basophile has granules Has everything to do with blood cells, then, become involved in a highly developed nomenclature as complicated as astronomy and almost as difficult to understand? At times it would seem so but the present apparent confusion is only a phase in the natural evolution of a complicated subject, which as yet is far from its solution

Important as is the magnificent work being conducted today in some of the splendidly equipped laboratories, where highly trained observers have the most modern facilities, there still remains the routine blood examination which may be done by anyone who commands the use of a microscope and the simplest of stains and diluting fluids

Let us then consider for a little while Lymphocytosis, actual and relative. Here is a blood picture easily recognized but which has undoubtedly tremendous importance from the standpoint of diagnosis, prognosis and treatment.

Some of the conditions characterized by an increase in lymphocytes will be reviewed very briefly

LYMPHATIC LEUKEMIA

Is in itself a large subject and will be only mentioned as the classic example of great increase in lymphocytes. Formerly said to be found in both acute and chronic forms, it is now generally admitted that the acute-form is much more rare than formerly thought. This is due to the use of oxydase stain which has shown many cases of so-called acute lymphatic leukemia to be myeloblastic.

Although leukemia is always associated with an increase in the white count, Ordway¹ has pointed out that the so-called "aleukemic"

* Read at a meeting of the New York County Medical Society
New Lork Academy of Medicine—March 26 1928

phase may appear at any time and may last indefinitely

INFECTIOUS MONONUCLEOSIS OR GLANDULAR
FEVER

Is now generally accepted as an entity and during the last few years has received a considerable amount of attention. It is of interest chiefly because of the ease with which it may be confused with more serious diseases.

Young adults are those most frequently affected, and it is noteworthy that physicians and medical students seem unusually susceptible. This has no particular significance other than that this class of patients offers an excellent opportunity for study, and too, they are likely to be interested when they note their symptoms.

The onset is gradual, the patient generally complains of "not feeling well," there is usually a sore throat, weakness and fever, which may occasionally get as high as 103 or even 104 degrees

The pharynx is red and tonsils affected the superficial lymphnodes, especially the cervicals are enlarged and sometimes tender. In about 70 per cent of the cases the spleen is palpable but rarely reaches more than three fingers breadth below the costal margin, this too may be sensitive. The nodes and spleen increase in size gradually and the return to normal is slow.

The blood count is interesting White blood cells are increased, especially if the condition is well developed. One of Longcope's² patients had a count of 26,000 and Cottrell⁵ reported a count as high as 31,000

Such counts are unusual and the average will probably be nearer 15,000 although some cases never have more than 10,000

The differential count is characterized by the large proportion of lymphocytes, these cells make up from 40 to 70 per cent of all of the leucocytes. The cell with a kidney shaped nucleus or the so-called "Rieder" cell is as a rule present in large numbers.

The highest white count is usually at the end of ten days or two weeks, but the return to normal numbers as well as to normal proportions may require a month or two

The red cells are very little affected and much of a drop in haemoglobin is not expected

At first the diagnosis is not easy typhoid is often thought of, tuberculosis or even Hodgkins disease have been considered before the blood was examined, and acute is mphatic leukemia afterward. After a few days the diagnosis is much simpler, especially as the patients are rarely very ill

than 100 beds each Of course all of these beds are not available for cases of chronic cancer Therefore Question D was asked If you admit patients in Class "C" how many beds are available in your hospital for such cases? Are they situated in wards? semi-private wards? private rooms? The answers to this question are eminently unsatisfactory from the viewpoint of determining the number of available beds Fifteen of the hospitals give the number of beds available They add up to 195 The answers are as follows 20, wards and semi-private wards, 2, private rooms, 2 or 3, 10 to 20, wards and private rooms, 1, private room, 2, 8, semi-private wards and 6 private rooms, 4, wards, 10, semi-private and private rooms, 1 or 2, 13, 4, private rooms, 90, wards, semi-private wards, private rooms (the hospital for incurables), 2, wards, 2, semi-private rooms, 2 private rooms, 3 private rooms, 1, semiprivate ward or private room Many superintendents beg the question "No specified number," "Depends on the activity of the service," "Indefinite," "No number," "Whatever needed," "Depends on rooms available," "Wherever available," "As necessary," "No beds set aside," "Any number needed," "No means of isolation," "Depends on finances of patient," "The determining factor being how long they are likely to remain and the financial status of the patient," "No definite number of beds set aside We prefer to put these cases in private rooms whenever possible," "We have no stated number of such beds, nor are they situated in any particular part of the hospital, their rooms depending entirely upon their financial condition"

The equivocal replies to question C are as follows "Admit chronic cases for 6 weeks," "temporary in private rooms," "avoid receiving," "Have occasional case, whatever the patient can afford," "Doctors as a rule do not send them to the hospital," "doubtful, we do not admit incurable cases," "during the past year we have had but three cases which required frequent surgical dressings In regard to the number of beds available for such cases we can give no definite answer for we have no special department," "rarely No specific number of beds," "to date we have not had many cases in Class C and we have not any

special beds available It would depend on the severity of the case just where we should put them I do not think we could care for them in the wards," "not usually," "yes, if necessary," "prefer not to," "not sufficient room," "we do according to circumstances of the case-but we do not make a practice of admitting such cases Always to private rooms," "not as a rule"

As a result of this questionnaire the following

comment may be made

(1) The cancer patient, in the early stages of the disease, can be adequately cared for in the

fifty-four up-state counties

(2) When cancer has reached a more advanced stage and for cases of recurrent cancer the opportunity for adequate hospital treatment is reduced by a little over fifteen per cent, and then the patient is looked upon with some suspicion and beguis to be undesirable

(3) The opportunity for hospital treatment of the final stage of a case of cancer is definitely limited, a little more than forty-five per cent of the hospitals that will admit early and late cases will admit the chronic case. This is the period in the life of the cancer patient when sympathy and philanthropy are needed and in which they are likely not to be found

(4) The facilities for deep X-ray therapy are limited No such facilities are available in thirty-

eight up state counties

(5) The facilities for radium treatment are also limited, no radium being available, except purchased emanations, in thirty-nine counties

(6) There is definite indication of the desirability for standardization of the equipment to be installed by a hospital in which deep X-ray ther-

apy is to be given

(7) There is no reason that I can see why a hospital should not "handle any kind of cancer case" It is always "advisable" to admit a case of cancer when application is made for the admission of such a case. As cancer is not transmissible why should any hospital refuse to admit such a case because the patient cannot be "isolated '''

(8) There is but one hospital for incurables in up-state New York-an institution of 118 beds in

Albany County

cervical nodes, no signs were found. The blood counts told an important tale

The possibility of "agranulocytic angina' was of course considered, but notwithstanding the blood count, the rest of the picture did not seem to fit, for among other reasons, the patient was an elderly man, the onset was sudden, and the throat was not particularly sore He died two days after the sudden rise in temperature and a post mortem could not be obtained A blood culture showed Streptococcus Haemolyticus

A boy (69986) of three years was admitted to the children's ward with a history of fever Although the that lasted for five months temperature had been normal for a time, it did not stay down and when the child was admitted he was running a temperature of about 100 with an occasional jump up to as high as 104 One of the reasons for bringing him in was a slight swelling of the face With the exception of swollen cervical nodes and a marked anemia there was little to be found on physical examination The fever was a real problem On one occasion some of the nodes in the neck were incised with temporary relief Staphylococcus aureus was obtained from the

The hemoglobin varied from 45 to 65 Sahli, the red blood cells from 2,000,000 to 3,100,000

The white blood cells on admission were 2,100, Neut 32, Lymph 65, Mono 3 The last count was 1,200 WBC, Neut 8, Lymph 68, Mono 12, Smudges 12

For the last week of his life the temperature ranged around 105. There were signs of bronchopneumonia and purpuric spots appeared. Two transfusions helped a little for a time but he died 24 days after admission.

A blood culture showed Staphylococcus aureus, and on post mortem innumerable abscesses were found in the viscera, the organism was obtained from these abscesses as well as the blood

A boy of nine years came into New York Orthopedic Hospital for the treatment of a small sinus over the lower extremity of the left radius. His leukocytes were 13,000, the differential was not remarkable except that the proportion of lymphocytes was higher than might be expected. He was not operated on at once and in three weeks his white cells were

found to have suddenly increased to 66,000, with the following differential, Neut 37, Eos 9, Bas 1, Large Lympho 6, Small Lympho 47, a few of the small lymphocytes were undoubtedly of the Rieder type. There was no anemia, no lymphnodes nor spleen, and no symptoms whatever, except the sinus. But the white cells were climbing in a most alarming fashion.

The problem was should the boy be operated upon? There appeared to be three pos-

sibilities

1 Acute lymphatic leukemia

2 Chronic lymphatic leukemia 3 An abnormal blood count due to some irritant, presumably a sequestrum, which the surgeons felt sure caused the sinus

- 1 Acute lymphatic leukemia is of course rare in the young, but is by all odds the most frequent of any of the leukemias (Ward¹º) in those under ten years. But this boy was NOT sick and had none of the usual symptoms of the disease except for the white cell count.
- 2 Chronic lymphatic leukemia is rare in the young and was definitely ruled out because the boy had a normal count a few weeks before
- 3 Hence it became necessary to find something else to account for the abnormal blood picture. It is well known that children break all rules of hematology when it comes to lymphocytes, but such a count was far higher than a hurried search of the literature revealed under similar conditions. So, without much enthusiasm, it was decided to operate

Three days before the operation, the white cells were 52,000 A small sequestrum of bone which was unattached and surrounded by "dirty granulation" was removed. The day after operation the leukocytes were 12,500 and two subsequent counts showed only slight variation. It is now 18 months since the operation and the boy continues to be perfectly well

Hardly had the paint dried on a nice new sign when a young medico was tremendously flattered by having his opinion asked about a case with an unusual blood picture tient was a husky young man who had re-cently been "ailing" For some time he had been running a low fever with no apparent Typhoid had been ruled out and the attending physician intimated that there had been some symptoms referable to the rectum but there was nothing definite in the physical examination except a few moderately enlarged lymph nodes and a palpable spleen. The patient did not appear seriously ill. The red cells showed a slight anemia, but the leukocytes seemed to have a story to tell, they numbered 16,000 Neut 26 Eos 1, Myeloblasts 8, Large I vmph 53 Small Lymph 12

The prognosis is always good and there are no complications

There is little to do but keep the patient

in bed and as comfortable as possible

No etiological factor has been found but the portal of entry seems to be either tonsils or the upper respiratory tract (Longcope², Sprunt and Evans' and Blaeborn & Houghton⁴)

DISEASES WHICH MAY CAUSE LYMPHOCYTOSIS

An increase in the lymphocytes may be found in exophthalmic goitre and tuberculosis, and has been reported in cases of generalized carcinoma. A tremendous increase has been found in pertussis. Seitz³ reports three cases of over 200,000 and ten of over 100,000, the lymphocytes were usually over 50 per cent

A relative increase in lymphocytes is usual in typhoid fever, syphilis, malaria, and pernic-

ious anemia

Occasionally pneumonia will upset usual precedent by terminating with a low white count and relative lymphocytosis. Menningers' case had only 150 to 350 white cells with only 5 per cent granular cells. This was just before death. Pneumococci were obtained but group was not mentioned.

AGRANULOCYTIC ANGINA

Much interest has been aroused of late by this very interesting condition, which most observers seem disposed to regard as an entity As the name implies it is characterized by a great decrease in the granular elements of the white blood cells, and sore throat

Although there have been many theories as to the cause of the disease and various organisms have been present, it is as yet impossible

to say what the etiological factor is

The onset is gradual and the patient is not particularly impressed. The throat is sore and there is some temperature. There is usually backache and general malaise. In a day or two the temperature climbs up to 103 or 104, but often the patient is surprisingly alert and does not appear to be as sick as the chart would indicate. There may be jaundice, superficial cervical lymphnodes, liver and spleen may be palpable.

It is safe to say that most physicians think the case is a "bad sore throat" or possibly a Vincent's angina, if the throat is not sore as sometimes occurs, typhoid may be suspected. The first blood count comes as a distinct shock and is likely to be in the neighborhood of 2,000 white cells with granular cells 10 per cent or less. The red blood cells will show little or no reduction and there will be no

The course is rapidly down, the throat gets worse and terribly annoying, what was a small area covered with evidate becomes a great

dirty slough that may involve the soft palate and even the roof of the mouth and gums The prostration is marked and the temperature continues to soar reaching 105. The patient becomes progressively weaker and seldom survives the fourth week

The white cells almost disappear and the granular cells are few and far between It is perhaps not amiss to say that the work of the hemotologist on such cases is not pleasant, for nothing is much harder than looking for something that is not there.

Kastlin's excellent paper deals with 43 cases Of the 43, nine were males, this is interesting as it was usually thought the disease attacked only females. The average age was 46 years for females and 29 years for males. Forty of the forty-three cases proved fatal, twenty-five had sore throats and a similar number were jaundiced, the average white cell count was 1,200, the lowest white cell count was 100, the percentage of granular cells was between six and zero.

Moore and Wieder reported a case that had an attack and recovered, but in two years

another attack terminated fatally

Because of the nigh mortality treatment is aimed at the comfort of the patient, and is limited chiefly to treating the mouth and attempts to relieve the discomfort due to the hyperpyrexia Sedatives are sometimes indicated Transfusions seem to afford only temporary relief

Thus far an attempt has been made to touch on some of the more recent work that has had to do with variations in lymphocytosis. It might be of interest to consider a few cases which if they add nothing to the knowledge of the world, will at least offer an opportunity for speculation

It is possible to refer to these cases because of the courtesy of Dr Hibbs of New York Orthopedic Hospital, Dr Phillips of Englewood, and Drs Mason and Gile of Presbyterian Hospital

A man (70314) of 65 years was operated on by Dr Gile for abscess of the prostate He did fairly well after the operation, but was inclined to run a little temperature, which was to be expected A month after the operation he had a sudden rise in temperature and signs of pneumonia were found. This only lasted a few days and he improved somewhat. It should be borne in mind that he was not a first class surgical risk, was an old man, had a blood pressure of 190/120 on admission, and was having a rather hard time of it. So that when his temperature shot up to 105, about a month after his attack of pneumonia, his lungs were suspected, but proved negative. Aside from a red throat and a few enlarged.

These considerations suggested to us that it might not be unprofitable to study a group of epileptics with regard to the diseases of childhood considering the problem from the standpoint of blood examination supplemented by a survey of the personal history in search of a clue to the possible existence of any relationship between these two pathological conditions -if such there be These investigations involved blood studies, the technical nature of which will not be discussed in any great detail in this article Here we hope to present to you some features of these observations that we trust will prove not only interesting but also of some practical value

For the purposes of this paper we will review the results secured with observations on about 150 cases altogether In selecting our cases only those individuals were chosen whose past personal history was not too much complicated by the occurrence in the same person of too many of the diseases of childhood These cases were divided into two series, the idiopathic group and the non-idio-By the term idiopathic we mean pathic one those instances of epilepsy in which there is no definite evidence of any pathological condition which could reasonably be regarded as the cause of the epilepsy, and conversely, by non-idiopathic we mean those instances of epilepsy which can be attributed to a definite probable pathological cause, such as, for instance, trauma Each one of these major divisions was further subdivided into a number

of minor groups dealing with the incidence in the same individual of measles alone, whooping cough alone, measles and whooping cough together, measles, whooping cough and diphtheria together, and also measles and scarlet fever together as their occurrence appeared in the patient's past personal history In each of these sub-groups the present age, the age of onset, the duration, the number of seizures (both severe and mild), the hemoglobin, the clotting and bleeding times, the white count and the differential of these patients were considered as will appear in the tables subsequently shown In some of the instances studied the past personal history seemed to indicate that the individual had not suffered from any of these diseases while in others no satisfactory information on this point could be gleaned from the record The former collection of such cases serves as a control for the various sub-groups just enumerated Figures for these cases, therefore, have also been incorporated in the following tables. In these tables the total number of cases included in the different sub-groups is, it will be noted, not constant throughout the table This is because the variation in frequency of the childhood diseases mentioned above has rendered it impossible to make these sub-divisions numerically comparable in this report For this reason a weighted average has been obtained for the combined number of cases in a series of successive sub-groups and is shown in the table after this combined total, the average indicated

The increase in the white count, the marked increase in the lymphocytes, and the general physical findings suggested an acute lymphatic To be sure the myeloblasts were a trifile difficult to fit in the picture, but it was thought that perhaps they were not myeloblasts, but lymphoblasts So with due regard for the feeling of the family the young practitioner with what eloquence he could command, prepared them for the worst time his bill was paid and the budding specialist telt that after all it was an excellent plan to do a little special blood work on the side

He was not so sure of this when he learned that his patient had been operated on for an abscess of the rectum and was making an un-This was well over ten eventful recovery years ago and aside from serving in aviation during the war the erstwhile acute lymphatic leukemia has nothing to report

It may be far fetched to try to associate those two patients, but it is well to go slowly in making a diagnosis of lymphatic leukemia if there is any possibility of a focus of infection

The last case to be considered is one that would not be regarded as a case were it not for a blood count An active business man had a routine physical examination when it was discovered that he had an abnormal white cell count The white cells ran from 35,000 to 45,000, with Neut 13, Lympho (mostly small) 87, occasionally eosinophiles and transitionals were found. No anemia and no symptoms nor physical signs, active in business and is in his office every day Regards his occasional blood counts rather as a joke

What is the diagnosis? It is impossible to regard such a count without misgiving, but it certainly is not justifiable to make a diagnosis of lymphatic leukemia and give him the mental burden of such a hopeless prospect

Conclusions

A marked leukopenia and decrease in the granular type of blood cells was produced by streptococcus haemolyticus and staphylococcus aureus in two individuals of very different But here the similarity ended, one resembled agranulocytic angina, the other air aplastic anemia

There may be found cases such as the young man with the rectal abscess as it is not unusual for a focus of infection to upset the blood picture considerably Such cases may at times be more readily diagnosed in retrospect, however, it is always a pleasure to see anything as hopeless as acute leukemia turn out to be something else, even though the diagnostician's pride is somewhat damaged in the process

It is vain to guess as to the cause of the lymphocytosis in the man who has no other This may well turn out to be a typical lymphatic leukemia, but it has been suggested that it is the result of an attack of infectious mononucleosis of which the patient was not aware

Finally, lymphocytosis, actual or relative, should always be regarded with profound sus-

A routine examination of the blood is rarely diagnostic, it is rather a guide post, but taken with history, symptoms, and physical signs, may help point the way to the solution of a difficult problem

SOME OBSERVATIONS IN CONNECTION WITH EPILEPSY AND SOME OF THE DISEASES OF CHILDHOOD*

A Report Based Primarily on Laboratory Findings Supplemented by a Scrutiny of the Personal History

By HAROLD A PATTERSON, AM, MD, FAC,P, And SAMUEL M WEINGROW, MD

N general practice convulsions in childhood are frequently encountered Also meningeal and central nervous system involvements at times develop as sequelae of the diseases of infarley and childhood Moreover, the onset of

epilepsy often appears early in life is conceivable that changes subsequent to the diseases of infancy and childhood might bring about pathological effects which, although they do not readily manifest themselves, might be reflected in alterations in the blood picture

^{*} From Craig Colony Laboratory

will be observed that when whooping cough occurs in combination with measles, or with measles and diphtheria, the average age of onset in these instances is about that at which it occurs in individuals with no history of previous childhood disease This apparent inconsistency renders it rather dubious as to what influence, if any, whooping cough exerts on the age of onset of the epilepsy

There is also considerable uniformity in the

average duration of the cases studied

With respect to the (weighted) average number of grand mals per year the frequency is about the same in the idiopathic and the nonidiopathic divisions. With whooping cough the incidence of grand mal seizures seems to be higher than when the history shows no childhood disease and also exceeds the (weighted)

average for the group

In regard to the (weighted) average number of petit mals it appears that the frequency of these mild attacks is greater in the idiopathic than in the non-idiopathic series Furthermore, the relatively high incidence in instances where the previous history of childhood disease is negative tends to suggest that this greater frequency is a part of the picture of the nonidiopathic aggregation rather than a result of the influence of childhood disease within the

Table II presents data dealing with coagulation time, bleeding time and the total white

In determining the coagulation time we obtained blood from a skin puncture and used the capillary method The technique is as follows The puncture should be deep enough to insure free flow of blood in order to lessen contamination with tissue juices The first drop should be wiped off, and the second used for the test Time is counted from the appearance of the The blood is taken up in a small capillary glass tube about 11/2 mm in diameter If clean the tube fills readily by capillary attraction Short sections of the tube are then carefully broken off at half minute intervals after scratching with a file, and the ends are gently separated When coagulation has occurred threads of fibrin will be seen to span the gap between the broken ends Since some definite endpoint should be adopted we selected as that end-point the time when the fibrin thread would span a gap of 4 mm before breaking Coagulation consists essentially in the transformation of fibrinogen, one of the proteins of the blood plasma, into fibrin by means of a ferment called thrombin The presence of calcium salts is necessary The process is complicated and not fully understood and the theories which have been offered to explain it are many and intricate

Normally, when blood is secured from an

ordinary skin puncture, coagulation takes place in from 2 to 6 minutes after it leaves the vessels, usually about four and a half minutes The time is influenced by temperature, the size of the drop and other factors, such as meals Our data indicates that the coagulation time in both major divisions tends to fall within the lower limits of the normal and occasionally even to drop below the lower normal threshold In this connection, it may be noted in passing that, since the coagulation time is accelerated. excessive bleeding from accidental injury in epilepsy is not likely to occur. As may be seen from the table the variation in coagulation time in individuals giving a previous history of different childhood diseases is not sufficient to serve as a differentiating factor between these various conditions in the epileptic Moreover, except for the point already made, the acceleration in coagulation time is not significant in itself for Todd1 says that the shortening of coagulation time is not of much clinical significance in general except in relation to possible thrombosis

Todd² further suggests that the determination of the coagulation time should always be supplemented by the estimation of the bleeding Bleeding time is a term used by Duke³ to indicate the interval required for a small cut to cease bleeding It does not necessarily parallel the coagulation time of the blood for it is thought to be largely dependent upon the efficiency of the tissue juice in accelerating clotting, upon the elasticity of skin and upon the mechanical and chemical action of the blood platelets. In determining the bleeding time we obtained blood from the finger employing the following technique After proper aseptic precautions, the usual puncture, as for a blood count, was made with a blood lancet The site of the puncture was touched at quarter minute intervals with a piece of absorbent paper until the blood flow had ceased Estimations were further refined by calculating, from the size of the last two spots on the blotting paper, the approximate point at which this cessation had occurred instead of accepting an arbitrary endpoint. In our experience with this collection of cases we found it much easier to estimate the bleeding time from a lancet puncture than from a needle puncture, since blood did not flow freely from a wound of the latter type even when the needle was driven deeply into the tissues

The normal bleeding time is from one to three minutes, although it may be prolonged A perusal of the data in the to 8 minutes table dealing with bleeding time, shows that this falls well within the normal limits in both classes of epilepsy and that the variations in bleeding time in the different varieties of childhood diseases studied is neither sufficient

in the sub-groups is, of course, the arithmetical mean. For the sake of brevity let it be understood that any reference to the diseases of childhood is intended to include also those of infancy.

From the first of the preceding tables, it may be noted that there is little variation in the ages of the patients chosen so that the groups and sub-groups selected are fairly uniform in our series with the exception of these instances in which there is a previous history of whooping cough when the onset appears at an earlier age than the weighted average age of onset for the group. In this connection it is also interesting to contrast the average age of onset for the individuals with a history of whooping cough alone with that for those who have had no childhood diseases. On the other hand, it

will be observed that when whooping cough occurs in combination with measles, or with measles and diphtheria the average age of onset in these instances is about that at which it occurs in individuals with no history of previous childhood disease. This apparent inconsistency renders it rather dubious as to what influence if any, whooping cough everts on the age of onset of the epilepsy

There is also considerable uniformity in the

average duration of the cases studied

With respect to the (weighted) average number of grand mals per year the frequency is about the same in the idiopathic and the non-idiopathic divisions. With whooping cough the incidence of grand mal seizures seems to be higher than when the history shows no childhood disease and also exceeds the (weighted) average for the group

In regard to the (weighted) average number of petit mals it appears that the frequency of these mild attacks is greater in the idiopathic than in the non-idiopathic series. Furthermore, the relatively high incidence in instances where the previous history of childhood disease is negative tends to suggest that this greater frequency is a part of the picture of the non-idiopathic aggregation rather than a result of the influence of childhood disease within the series.

Table II presents data dealing with coagulation time, bleeding time and the total white count.

In determining the coagulation time we obtained blood from a skin puncture and used the capillary method The technique is as follows The puncture should be deep enough to insure free flow of blood in order to lessen contamination with tissue juices The first drop should be wiped off, and the second used for the test Time is counted from the appearance of the The blood is taken up in a small capillary glass tube about 1½ mm in diameter If clean the tube fills readily by capillary at-Short sections of the tube are then carefully broken off at half minute intervals after scratching with a file, and the ends are gently separated When coagulation has occurred threads of fibrin will be seen to span the gap between the broken ends Since some definite endpoint should be adopted we selected as that end-point the time when the fibrin thread would span a gap of 4 mm before Coagulation consists essentially in the transformation of fibrinogen, one of the proteins of the blood plasma, into fibrin by means of a ferment called thrombin The presence of calcium salts is necessary The process is complicated and not fully understood and the theories which have been offered to explain it are many and intricate

Normally, when blood is secured from an

ordinary skin puncture, coagulation takes place in from 2 to 6 minutes after it leaves the vessels usually about four and a half minutes The time is influenced by temperature, the size of the drop and other factors such as meals Our data indicates that the coagulation time in both major divisions tends to fall within the lower limits of the normal and occasionally even to drop below the lower normal threshold In this connection it may be noted in passing that, since the coagulation time is accelerated excessive bleeding from accidental injury in epilepsy is not likely to occur. As may be seen from the table the variation in coagulation time in individuals giving a previous history of different childhood diseases is not sufficient to serve as a differentiating factor between these various conditions in the epileptic Moreover, except for the point already made the acceleration in coagulation time is not significant in itself for Todd' says that the shortening of coagulation time is not of much clinical significance in general except in relation to possible thrombosis

Todd2 further suggests that the determination of the coagulation time should always be supplemented by the estimation of the bleeding time. Bleeding time is a term used by Duke to indicate the interval required for a small cut to cease bleeding It does not necessarily parallel the coagulation time of the blood for it is thought to be largely dependent upon the efficiency of the tissue juice in accelerating clotting upon the elasticity of skin and upon the mechanical and chemical action of the In determining the bleeding blood platelets time we obtained blood from the finger employing the following technique. After proper aseptic precautions the usual puncture, as for a blood count, was made with a blood lancet The site of the puncture was touched at quarter minute intervals with a piece of absorbent paper until the blood flow had ceased Estimations were further refined by calculating, from the size of the last two spots on the blotting paper, the approximate point at which this cessation had occurred instead of accepting an arbitrary endpoint. In our experience with this collection of cases we found it much easier to estimate the bleeding time from a lancet puncture than from a needle puncture since blood did not flow freely from a wound of the latter type even when the needle was driven deeply into the tissues

The normal bleeding time is from one to three minutes, although it may be prolonged to 8 minutes. A perusal of the data in the table dealing with bleeding time shows that this falls well within the normal limits in both classes of epilepsy and that the variations in bleeding time in the different varieties of childhood diseases studied is neither sufficient

SOME RADIOGRAPHIC AIDS IN THE DIAGNOSIS OF DISEASES OF ESOPHAGUS AND CARDIA*

By JOHN RUSSELL CARTY, MD, NEW YORK, N Y

■ISEASES of the esophagus and the upper portion of the stomach form an interesting and, at times, exceedingly puzzling group to diagnose It is the purpose of the author to discuss some of the radiographic signs which have been found useful in diagnosis and to add a few original observations

The gullet is probably not as fixed in position as is generally thought and is capable of enormous Normally there are five important points of narrowing, as follows at the introitus, the aortic arch, the crossing of the left bronchus, the hiatus esophagi and at the cardiac opening

Just before entering the hiatus esophagi the gullet describes a lateral and anterior curve to reach the stomach The esophageal opening in the diaphragm is simply a space between two muscle bundles which arise from the spine Mosher has shown that this portion of the esophagus moves in response to the respiratory movements, to the midline and forward on inspiration

The cardiac portion of the stomach hugs the diaphragm along its medial half but falls away in the outer half due to the interposition of the spleen and in asthenic individuals, the splenic flexure of the large gut The cardia closely follows the movements of the diaphragm, molding itself to the shape of the diaphragm. The gas bubble is of course familiar to all and varies greatly in size

A careful radioscopic examination is essential The radiograph should be used to check observations made while screening The dynamics of the part play a greater role here than in other portions of the digestive tract, hence the necessity of the screen examination

For routine work the ordinary barium meal will suffice. If no lesion is demonstrated a thicker mixture may be used If this fails, it is wise to have the patient swallow a dry cracker Spasm at the site of the lesion may thus be excited If the patient complains of dysphagia and can indicate the point of obstruction by placing the finger on the body corresponding to the level of the esophagus, a very careful and intensive study is made This is repeated if necessary

our experience this points strongly to an organic lesion of the esophagus

A definite routine is essential The patient is first examined upright and is placed in the right oblique position The central ray is directed over the gastro-esophageal area and the patient told to swallow a mouthful of the barium meal The first swallow is often the critical time for observing lesions in this region The remainder of the gullet can be studied subsequently

The patient is told to recline on the horizontal radioscopic table and the upper portion of the cardia is studied. During inspiration firm pressure is made on the anterior abdominal wall with the flat of the hand This increases the intraabdominal pressure, causing a herniation through the diaphragm if such a tendency exists prone position may be employed and sometimes

gives helpful information

As the meal passes down the esophagus there may be some slight hesitation, particularly at the normal points of narrowing mentioned above The heavier the meal, the greater the hesitation which may be more marked at the gastro-esophageal junction Normally, however, there is an initial spurt of the barium into the stomach If this spurt is absent, an early obstructive lesion should be suspected although the actual time taken in passing into the stomach may be the Regurgitation into the esophagus from the stomach is not uncommonly seen in normal individuals

Carcinoma -- Carcinoma of the esophagus generally causes an obstructive lesion. In the cardia two types are recognized a bulky, fungating adenocarcinoma and an infiltrating, fibrosing or scir-This latter type may be exceedingly rhous type difficult to detect

Malignant neoplasm is generally considered to be considerably more frequent in the lower half This has not been our experience Out of 100 cases of carcinoma, forty-six percent were situated in the upper half The location of the lesion is of little help

The character of the obstruction may be of some help While the presence of a smooth constriction does not rule out malignancy, still a serpentine course through the constricted area is suspicious of malignancy

nor constant enough to serve as a differential criterion in these conditions

In obtaining total white counts the usual technique was followed except that we employed varying concentrations of acetic acid, all of them stronger than the solution generally used as a diluent This modification, we believe, has the advantage of presenting a clearer picture since the other solid elements of the blood are more quickly and completely destroyed without any apparent injury to the leucocytes themselves than in the ordinary Scrutiny of the above table discloses the leucocyte count to be slightly above normal for adults (but not for children) in both the idiopathic and the non-idiopathic group Since it occurs in both series we assume that the slight increase in the total white count is not due to essential epilepsy itself but to some concomitant phenomenon connected with its manifestations, such as, perhaps, the mechanism of the seizure It may further be noted that the differences in the leucocyte count in the various childhood diseases studied is again not enough to be interpreted as a differential factor of any significance

The third table indicates the differential white counts in the different classes and sub-

groups

The percentage of polymorphonuclear neutrophiles falls within normal limits and shows no significant variation with the various childhood diseases

In general the percentage of lymphocytes is high. Moreover, this appears to be a result of the epilepsy since the percentage of lymphocytes is higher in those instances where there is no previous history of the childhood diseases mentioned than it is in the (weighted) average for the group. This fact is of interest in interpreting the blood picture in a case of whooping cough in an epileptic child, for although the lymphocytic fraction is not so high in our cases, Todd4 claims that a marked lymphocytic leucocytosis occurs in pertussis appearing early in the catarrhal stage and persisting until after convalescence and that it is of value in diagnosis

By endotheliocytes, or endothelial leucocytes, we mean phagocytic cells which take their origin from endothelial structures. These cells were formerly called transitional cells but this term is a misnomer since they do not represent an intermediate stage of development. Normally, they number from two to six per cent of the white cells of the blood. Here they are below the normal limit in both the essential and non-essential groups mentioned above and they occur in a much smaller percentage in the latter group than in the former. The significance of this, if it has any, is not clear to us. Furthermore, the percentage fraction is

relatively high in those idiopathic cases which have had whooping cough, but these instances however are too infrequent to induce us to risk an opinion as to their diagnostic value here

The eosinophils in the groups studied fall within the lower limits of the normal range and there is not enough of a difference between the numbers in which they occur in the various individuals with different childhood diseases to be noteworthy. This is interesting for two reasons In the first place, various other observers have reported the presence of eosinophilia in epilepsy and we ourselves have observed it, although it does not occur in the cases selected, in the second place, Todd says that scarlet fever is frequently accompanied by an eosinophilia which may help to distinguish it from measles Evidently this is a transient rather than a permanent increase in the eosinophils since we see no evidence of it in those individuals with a past history of scarlet fever But the frequent occurrence of eosinophilis in epilepsy must nevertheless be borne in mind in connection with the diagnosis of animal parasites, worms, and urticaria in epileptic children

On the whole the basophiles fall within normal limits as might be expected since a notable increase is limited almost exclusively to myelogenous leukemia

Unfortunately, as in other methods of approaching the problem, these blood examinations fail to establish any definite relationship between epilepsy and the diseases of infancy and childhood. While the results of this investigation must be couched largely in negative terms, we feel justified in submitting the following conclusions.

1 The influence of whooping cough, if it has any, on the age of onset of the epidepsy is uncertain for our results show an apparent contradiction between the effect of whooping cough on the onset when it occurs alone and when it occurs in combination with other child-hood diseases

2 In our series a greater number of grand mals per given period was found with whooping cough than with any other of the childhood diseases studied

3 As the coagulation time is accelerated in epilepsy, excessive bleeding is not likely to occur

4 The lymphocytic leucocytosis often present in epilepsy must be taken into account in interpreting the blood picture of pertussis where there is also a lymphatic leucocytosis

5 The possibility of an eosinophilia in epilepsy must be borne in mind in interpreting the blood picture in children when scarlet fever, worms, parasites or urticaria is being considered

6 In our group, the coagulation and bleed-

COUNTY DEPARTMENTS OF HEALTH

Those who are seriously engaged in official public health work are convinced of the necessity of county departments of health, modelled on plans suited to the peculiar conditions of New How Suffolk County secured a county department of health is told on page 1127

of this issue Two essentials of the campaign in that county were the leadership of physicians and the avoidance of controversy and argument The success of the campaign conducted by the Suffolk County Medical Society is its own justification of the methods used

There may be considerable dilation above the lesion especially in the upper half The dilatation is generally less than in cardiospasm. Fluid retention is rarely seen. If the dilatation is extreme, a picture resembling diverticulum may re-The dilated portion of the esophagus may extend along the point of obstruction, causing a pocket formation. In a diverticulum the barium is seen to pass into the pocket and spill out, while in the condition mentioned above the barium passes through the stricture and into the pseudodiverticulum at the same time

If coughing is noted as the barium reaches an obstructed area, the possibility of an impending tracheo-esophageal fistula should be considered Out of the series mentioned above, four cases giving this sign eventually developed a fistula

Much caution should be exercised when a suspected malignant lesion is located at the hiatus esophagi or at the junction with the stomach. especially if the findings are not marked Recently the writer has collected six cases in which a fairly confident diagnosis of carcinoma of the lower end of the esophagus was made three years they were all alive and in fairly good The patients were all over fifty and condition showed a slight irregularity of the posterior wall of the esophagus just above the hiatus was a small amount of obstruction with a slight dilation above

The history was that of an indefinite, unlocalized dysphagia with a slight loss of weight. The symptoms were of recent date. There was no evidence of liver disease. The other findings were negative No autopsy or esophagoscopic findings are available Reexamination of two of these patients showed essentially the same findings as at previous examination. The symptoms and physical findings were essentially the same

This condition might be due to a loss of tone of the esophagus and diaphragm with consequent slight constriction at the hiatus. The length of time elapsed should rule out malignant neoplasm The presence of dysphagia and a slight loss of weight in a patient of the cancer age is suggestive of carcinoma

In view of the above findings too confident a diagnosis of cancer should not be given in atypical lesions, but reexamination at a later date should serve to differentiate

Carcinoma of the Cardia has been particularly well described by Notkin The splitting and irregularity of the barium stream is exceedingly important The lack of pliability of the cardia, as shown by the absence of molding of the stomach to the diaphragm, has been given only pass-This may be the only sign in a ing mention scirrhous carcinoma Another way of estimating this is to compare the size of the cardia in the upright position with that in the supine position The normal cardia should expand as the barium runs in when the supine position is assumed There may be some limitation of motion of the dıaphragm

Diaphragmatic Herma—Hermations through the diaphragm are probably more common than the statistics give because undoubtedly many of the smaller ones are overlooked

The small hermae are generally seen through the hiatus esophagi. If the barium stream takes an upward curve just before or after entering the stomach, a hernia through the hiatus is strongly suspected A thorough study in the supine position will demonstrate the hernia if present Many of these small hermations show regurgitation into the esophagus with a small amount of dilation

The large hermiae are not so readily over-Very rarely there may be ulceration at looked the hernial ring, blocking the lumen When this takes place the stomach has the appearance of a truncated cone, the apex pointing upwards This sign is important only if there is a mass directly above having intimate relation with the diaphragm A large number of stomachs which have hermated through the diaphragm are smaller than normal and may be acutely flexed along the lesser curvature

SUMMARY

Salient points of the anatomy of the esophagus and cardia are described

Some diagnostic aids in carcinoma of the escphagus and cardia are given

A condition simulating carcinoma of the lower

end of the gullet is described

Several diagnostic signs in the diagnosis of diaphragmatic hernia are given

parent has followed the advice Also ascertain the mother's opinion regarding the physical progress and present state of the health of the baby

Second—We further recommend that a record of the social service calls on the babies be kept for three months and that the records then be studied with the view of determining what action if any should be taken

These recommendations are in line with an investigation which was made by the physicians of the South Side Clinical Society in April and May, 1925, the results of which were published in the Long Island Medical Journal for July, 1925—IVilliam H Ross M D, in the Monthly Bulletin of the Southside Hospital, August 1928

DR. JOHN ARCHIBALD SMITH

Physicians throughout New York State appreciate the characteristics of Dr John Archibald Smith, who died suddenly on August 20th from an acute heart attack Although he suffered from extensive tuberculosis, yet in his demeanor, as well as his personal appearance, he concealed his affliction Nevertheless his condition enabled him to deal with tuberculosis problems with a sane and scientific spirit which had a universal appeal to physicians Starting as a family doc-

tor and rural health officer, Dr Smith became Secretary of the New York State Department of Health, and later Medical Secretary of the National Tuberculosis Association. Yet he retained the friendly spirit of the best type of country doctor. Practicing physicians, and especially health officers, will remember him as the type of man which a public health administrator should be

OUR LONDON LETTER

The London letter of this issue is a felicitous. bit of writing done in the best style of English writers. It gives due credit to American speakers and sums up the cancer problem in

a few clear statements Its statement of the uncertainty of prognosis in the two fields of cancer and racing will appeal to the sporting instincts of Americans

LOOKING BACKWARD

This Journal Twenty Years Ago

Facilities for Tuberculosis Cases—The extensive anti-tuberculosis work of the present day is in great contrast with its meagerness only twenty years ago, as is shown by the following extracts from this Journal of September, 1908

"How poorly equipped the State is at present to deal properly with tuberculosis cases, is day after day vividly impressed upon those engaged in the campaign to secure control over the disease. Many cases might be cited to show the lamentable lack of facilities for caring for consumptives. The following is an illustrative case.

"A young mother with two infants of tender age, became ill A local doctor examined her and suspected that it was tuberculosis, but he could not be sure without having the sputum examined by a bacteriologist. The patient was too poor to pay the cost of such an examination, while the doctor did not know that he could have the examination made without charge by sending the sputum to Albany

Valuable time was lost before the examination was finally made"

The article describes the red tape and long delay in getting the patient examined for Ray Brook, only to be refused admittance because the disease was then too far advanced. The article continues

"If there were in this city, as there should be in every city and town in the State, a-dispensary, a visiting nurse or nurses, and a bacteriologist to make examinations of the sputum without charge, it is altogether probable that the disease in this case would have been discovered in its incipient stage and that the patient would have been promptly placed in the State Hospital, or under other conditions which would immensely increase the probability of her recovery and absolutely protect the family from infection When the well-approved measures for cure and prevention which it is the object of the campaign against tuberculosis to secure, are generally adopted throughout the State, such cases as these will be impossible"

SOCIAL SERVICE IN A VILLAGE HOSPITAL

The following report on the proposition to establish a Well Baby Clinic in the Southside Hospital at Bayshore, N Y, sets forth the principles of social service in a village hospital in a manner suitable for the editorial page of this Journal Editor's note

The need for a dispassionate study of existing facts and a calm analysis of results obtained as a basis for decision as to expanding activities in any kind of altruistic effort is unlikely to be controverted by anyone

One naturally asks what is the objective in social service and in the proposal to establish a Well Baby Clinic for the Southside Hospital? Is it to remove cases of distress by dealing with groups? or is it to give immediate relief dealing with individuals?

If something definite cannot be done in preventing future distress or in advancing health education as to what can be had in the prevention of disease, the giving of relief only will be endless and of no use beyond the immediate need To give immediate relief to the unfortunate is probably about as far as social service can go in the communities served by this hospital. There is limited opportunity for anything else and not much need to seek social reforms since little or no-general unfavorable economic conditions exist.

Is the conception of social work just case work—each piece separate and distinct from every other piece of work?

What is planned to be gained from the establishment of a Baby Clinic? Certain questions arise about it. What is the need? How many cases are there now of those born in this hospital or-in the practice of its doctors who do not go to their physicians once a month? How many are there who are neglected? We have never had a report of the need for a clinic. The facts surely can be shown Social service must not lose sight of the fact that it is now essentially philanthropy and that it might be repugnant to self-respecting persons as well as destructive to their self-inde-If the sociological effort in this hospital field keeps within charity limits, its work If it goes beyond this, it will put will be small the doctors into competition with the hospital and be destructive also of personal financial responsibility

Giving people valuable service without developing personal responsibility is always destructive of ,social morale and out of harmony with the usual conception of self-reliance

If a medical clinic could be confined to those who would not otherwise have scientific medical service, it should be commended. If it gives people service that they are able to pay for, it injures the medical profession upon whom the health of the community is dependent, and equally

destroys personal self-reliance and creates repugnance in self-respecting persons

Much social work is now being done throughout the country that is unethical, unnecessary, and injurious in taking from people the stimulation of personal initiative. Leading public health experts and teachers are nowadays discussing this phase of social work and counseling and stressing that public health education should be the primary object, and advising the individual to go and buy the service and become better citizens for doing it

Perhaps the only field for social service in this hospital will continue to be along lines of individual relief when distress occurs from causes beyond the control of anyone. There is here no question of a living wage, abolition of slums, child labor, the lack of economic opportunity, and other things understood in present day sociological effort.

There is, however, an almost open field to engage in public health education, and to quite an extent to engage in public health work by joining with other agencies, in informing people or individuals, whenever the opportunity presents, of what can be had in disease prevention

To aid in keeping well competent opinion has fixed upon about seventy-five health examinations throughout life For all of these the only one who is competent to render this service pathologically or physiologically is the family physi-No other agency can give any service comparable to that which a private physician can give to his patient Therefore, if careful analysis of the facts shows the need for a Well Baby Clinic, then it must be organized along lines approved by expert medical opinion Naturally, the competent source of medical information can come only from the medical profession—it is the only authoritative source of information regarding disease and its prevention

The establishment of a clinic needs a good deal of thought. Clinics may be good. Too often they are unnecessary. No clinic succeeds without the cooperation of the family doctor in his private practice. This fact must be kept uppermost. No clinic succeeds unless so conducted as to maintain the community's confidence in its medical profession.

The writer has had during the last year the opportunity of studying social work, clinics, and public health work in eleven places in six states. Some of the conclusions reached are used in this discussion

The Medical Board's specific recommendations are

First—That the 'social service worker visit every hospital baby within the first month after leaving the hospital and advise the mother to take the baby to her doctor, and make a second visit two weeks later and find out whether or not the

pseudo-influenza, while in a second group there were fever, vomiting, diarrhea, and in one case icterus Of nervous symptoms vertigo is mentioned and, pointing to infection, a chill with sudden rise of temperature of short duration rise may recur but the amount and height of fever play no role in the severity of the later disease. Just before supervention of the paralytic symptoms we may see headache and a meningeal reaction. The lack of a positive Kernig and a sterile liquor are not good but bad symptoms, for the two negative finds are common in acute poliomyelitis Other symptoms sometimes encountered were neuritis-like pains and tender areas in limbs which later became paralyzed Hyperidrosis, especially of the head and legs was often seen. It is of great interest to note that the special serum in use for the disease will control some of these early symptoms, especially those characterized by pain But these various symptoms cannot justify the diagnosis of incipient poliomyelitis, even if cases exist in the neighborhood Moreover, the disease not infrequently begins at once with the paralytic symptoms the present connection the subject of abortive cases is of interest. These are hard to recognize In the midst of an epidemic in Roumania there were many cases of isolated facial paralysis, associated with exposure. The prognosis was good, perhaps because the serum was ap-Sometimes this paralysis has set in with high fever As far as we know, the general sequence is somewhat as follows various symptoms pointing to general infection, a meningeal stage, and finally the paralytic stage—Klimsche Wochenschrift, August 5, 1928

Specific Prevention and Treatment of Epidemic Poliomyelitis -Simon Flexner and Fred W Stewart, writing in the New England Journal of Medicine, August 2, 1928, excix, 5, review the conditions under which infection and protection are promoted in experimental polio-Recently they have studied the effects of a preliminary intravenous injection of convalescent serum on the result of an intracerebral inoculation of the virus If as much as 15 cc. of the convalescent serum is injected into the blood of monkeys 24 hours before a suitable dose of filtered virus is injected intracerebrally, infection does not take place. The test is a severe one, because a lesion is produced in the cerebral tissue at the site of inoculation and also a locus of reduced resistance in which the virus rests is thus created. It is even possible that a-smaller intravenous serum injection may protect. On the basis of these tests it is proposed that convalescent human serum should be employed at times of stress and anxiety, when poliomyelitis is epidemic, for producing passive immunization The doses of convalescent serum suggested are 10 c c for children and 20 cc for adults, injected subcutaneously and repeated after a period of four to six weeks if the danger still continues recent experiment which Flexner and Stewart have carried out make it more than ever desirable to devote attention to the relative therapeutic value of convalescent serum when administered together, intravenously and intraspinally, alone intraspinally, and alone intravenously There is one point which should be borne in In the passive immunization tests in monkeys, several days - called the incubation period of the disease—elapse between the inoculation and the appearance of the first symptoms This period permits the immune antibodies to become well distributed throughout the central nervous system. In preparalytic or early paralytic poliomyelitis in man, the first effects of the virus have taken place, and the next events may There is, therefore, not follow very quickly the same periods of time provided for the immune antibodies in the blood to reach in concentration all parts of the nervous system. Hence it would seem advisable, theoretically at least, that one intraspinal injection of the convalescent serum should be given at the earliest practical moment

Is Diphtheria on the Increase?—Professor J von Bokav of Budapest, who has been in close touch with diphtheria and its serum treatment for the past 40 years believes that during the past two or three years the malady shows some tendency to increase in both frequency and sever-Curves plotted show rise of morbidity at 1890-2, 1903-4, 1915-16 and 1927 These intervals show some regularity. The mortality curve is much less striking for since the initial decline following introduction of serum treatment there have been no marked exacerbations although the mortality for 1927 is higher than for the preceding nine years Other statistics of much interest refer to the doses of serum in use at different periods Up to 1899 the average dose was about 1,500-3,000 units, but by 1905 it was 2,000-4,000 and by 1908 3,000-6,000 In 1918 it had risen to 6,000-8,000 During all of this long period the maximum given was not over 8,000, but in the past two years some severe cases have received specially large amounts. ranging up to 50,000 units! These Budapest figures, high as they are, have been exceeded elsewhere, as in Copenhagen, where 100 000 units have been exhibited to a single patient. Can this great increase in dosage be explained in any other way than that the disease is not abating in severity? Since the dosage of serum began to go up it has shown no tendency to come down again It is true of course, that the former doses are now generally regarded as absurdly small, while the increase was natural as soon as it became apparent that much larger doses could be tolerated and were the patients' right. If the

MEDICAL PROGRESS

The Newer Knowledge of Cancer Metabolism and Some Other Aspects of Cancer Research --- Writing in the New England Journal of Medicine, August 23, 1928, excix, 8, Eugene C Glover reviews two interesting theories of the origin of cancer The first is based on studies showing that cancer tissues contain much vitamin B and no vitamin A Cancer is, therefore, the result of whatever disturbs the vitamin balance of the tissues, so that vitamin B predominates over vitamin A to an abnormal degree The second theory is based on the work of Freund and Kammer who claim to have isolated a substance in the normal serum which destroys cancer cells. it is a dibasic saturated fatty acid with a molecular weight of 500 The serum of cancerous persons is said to contain a different substance which protects cancer cells from the lytic action of normal serum, this substance being an unsaturated fatty acid, which is combined with the nucleoglobin of the serum. The authors record that with increasing age of persons the cancer destroying power of the serum gradually dimin-Freund and Kamerin have isolated from the intestinal contents of normal persons a specific fatty acid which is supposed by them to destroy cancer cells, and have shown that the intestinal secretions can actually form this substance by acting on fats, especially palmatin. In cancerous persons, however, there is an anomalous condition which prevents the formation of this Glover describes the technique by which Otto Warburg studied the metabolism of resting tissues and of various tumor tissues in order to determine the relative importance of oxidation and of lactic acid fermentation of these tissues, and also their metabolism under aerobic and anaerobic conditions He found that all the tissues, both normal and malignant, had about the same amount of oxygen consumption, except the retina, and that whereas normal resting tissues and embryonic tissues produced little or no lactic acid in the presence of oxygen, benign tumors produced as a rule somewhat more, and frankly malignant tumors produced a large The reason why cancer tissue can produce lactic acid in the presence of oxygen is that the ratio of lactic acid production to oxygen consumption is so great that the oxidative processes are unable to furnish enough energy to transform any great part of lactic acid back into glu-More recently Cori and Cori reported experiments from which they conclude that probably a very low free sugar content is characteristic of malignant tumors in general In discussing the significance of his observations, Warburg regards cancer cells as present in all normal tis-

sues, and holds that the exciting cause of their exclusive proliferation is a sustained local lack of oxygen "Irritation" becomes anoxemia. This view remains without direct evidence in support or denial. It is definitely established, however, that malignant tissues utilize carbohydrates in a manner strikingly different from that of most normal tissues.

Sodium Oleate and Titanium-Lipase in Cancer Treatment —D Gardner comments on the decreased enzyme action in general and, in particular, decreased lipolytic action in the serum of cancerous patients, and calls attention to the chemical differences of cancerous and normal He has found that the Shaw-Mackenzie method of studying blood and tissue changes in cancer suspects gives very satisfactory results He thinks the public should be informed of the advisability of having the blood examined from time to time, and especially after operations Among the substances which foster lipolytic action is sodium oleate, with which Gardner has The contents of . obtained encouraging results a sterile ampule containing 2 cc of 2 percent sodium oleate, warmed to about 30° C to bring the solution into a more mobile state, is injected intravenously The duration of the treatment depends upon the individual case, to prevent recurrence the treatment is continued at a reduced rate, even after the blood test is no longer posi-Cancerous tissues reduced to ash show a marked increase in calcium and potassium over normal tissue, together with a disappearance of manganese and titanium and an imbalance in the iron content Experiments with various preparations led to the finding that a compound obtained by the action of a 10 percent solution of pure titanium tetrachloride on an aqueous solution of lipase gave promising results sidering that the rôle of lipase in its lipolytic action is to assist in digesting oils and fats and that there is a disappearance of titanium in the cancerous cells, this treatment of cancer seems opportune. In some cases a joint treatment with titanium-lipase compound, by mouth, and sodium oleate injections, was applied, and in cases of external cancer titanium ointment proved highly satisfactory - Journal of Tropical Medicine and Hygiene, August 1, 1928, xxxi, 15

Initial Symptoms of Infantile Paralysis— Dr Hans Cohn publishes a review of the recent interature of this subject, which shows an astonishing range of variability Etienne, for example, in a large material noted affections of the upper air passages, as angina, bronchitis, and five months after operation, the improvement continues to be satisfactory. The patient must of course be under the treatment for tuberculosis (the author neglects to state what if any other tuberculous lesions are present). She gives a strong reaction to tuberculin. The gain in weight is not over 3 pounds. Further implantations may be resorted to, and if human material is not available animal adrenals may be tested.—Münchener medizinische Wochenschrift, June 15, 1928

Perforative Disease of the External Ear -According to Dr P Jacques of Nancy, this name is suitable for cholesteatoma of the auricle However, the term is often misapplied to a condition which is nothing more than an uncomplicated chronic eczema and in any case has nothing in common with cholesteatomatous affection of the middle ear, although in both we see proliferation of epithelium and usury of bone along with a slight discharge In this condition the external ear, after evacuation and cleanliness, will be found unassociated with middle ear disease. But once the canal is clean it may appear wider than normal owing to a depression which is filled with exuberant granulations Fragments of exfoliated bone come away, but removal of these is not followed by pain or hemorrhage the affection is of such an insidious character that the patient ignores its existence brane may be intact but even if perforated or destroyed there is seldom any true otorrhea Briefly, we have here a torpid ulcer which is made possible by the thinness of the integument at this point, by its poverty in blood vessels and by the spongy character of the subjacent bone. It resembles somewhat perforating ulcer of the nasal septum Authors have regarded the condition as a purely accidental complication of eczema, as a manifestation of syphilis, etc., but it conforms better to our ideas of a trophoneurosis, as shown by the striking lack of pain and tender-Scratching, lack of cleanliness, etc, may play a minor rôle, but the condition agrees, as before said, with our ideas of a dystrophy author had a number of cases analyzed carefully as material for a graduation thesis by his student Revel, and the neuropathic factor was manifest in half of them, so that it may well have been involved in the others —Bulletin de l'Académie de Médecine, July 24, 1928

Familial Infection of Chronic Sinusitis, Its Clinical Import.—Patrick Watson-Williams says it would seem inevitable that chronic as well as acute catarrh should be contagious, yet this is not an easy quesion to prove in practice. If, as there is good reason to suppose, chronic nasal focal sepsis is a causal factor in appendicitis, gastroenteric catarrh, etc., we ought to find that such abdominal subinfections tend to prevail in families exhibiting a proclivity to chronic naso-

oral sepsis In an article published in 1921, the author reported that in a series of 90 consecutive unselected cases of definite infective nasal sinusitis, no fewer than 14 (over 155 percent) of the patients had undergone appendectomy Others in the series had had gastric or duodenal ulcer, so that of the 90 patients almost 19 percent had had operations for one or the other A child when the subject of nasal sinus focal infection rarely escapes infection of the adenoids and tonsils, and when these alone have been removed, the persistent reinfection of the remaining lymphoid tissue causes recurrence of the adenoids, perhaps once or twice This child will tend to infect brothers and sisters, it gets the credit of starting the family colds. If the child grows up and marries, the carrier parent is prone to infect members of his family. In some cases the author's investigation of such an unsuspected source of infection in children has revealed the fact that the parent has been the subject of a long-standing nasal sinus infection. What has been accepted as inborn familial constitutional weakness may perhaps be more correctly explained as "carrier infectivity" There is good reason to believe that early and effective treatment of parental nasal infection would save many serious abdominal operations, without taking into consideration manifestations of conveyed infection in other regions —Practitioner, August 1928, exxi, 2

Undulant Fever —R. H. Kampmeier observes that within the past few years there has been an increasing number of cases of Brucella melitensis infection reported in the United States. indicating a more common recognition of this disease, though without question it is often considered to be typhoid fever. He reports six additional cases, three of bovine origin, and the remainder presumably due to goat's milk Brucella melitensis infection is characterized by waves of fever alternating with afebrile periods-a fever with the peak in the evening and morning remis-Chills, sweats, anorexia, and loss of weight accompany the fever in almost all cases Arthritic pains and even swelling of the joints may be prominent in the picture Most of these symptoms were present in the author's cases The liver and spleen may be enlarged been the impression of several writers that the strain occurring in the goat will produce in the human a more serious type of the disease than In Kampmeier's cases this the bovine strain contrast seems to be borne out, there having been arthritic symptoms, splenic and hepatic enlargement, and more severe systemic manifestations than in the three cases of bovine origin interest to note that the white blood count was in all cases within normal limits and that lymphocytes may be the predominating cells -American Journal of the Medical Sciences, August, 1928. clxxvi, 2

dosage must be so high this is the greater argument for immunization by the Schick method, but like most Continental authorities the author is silent on this resource. As the mortality from the disease is still small the chief significance of the author's remarks is related to the future. Incidentally he is unable to connect any increase in virulence of the disease with mixed streptococcus infection—Deutsche medizinische Wochenschrift, August 3, 1928

Massive (Atelectatic) Collapse of the Lung -Leroy Sante, writing in the Annals of Surgery for August, 1928, laxxviii, 2, emphasizes the importance of making a clear distinction between atelectasis and collapse of the lung incidental to pneumothorax The term atelectasis should be reserved for cases in which there is collapse of a previously well aerated lung without mechanical obstruction from foreign body, tumor, or anomaly The condition is more frequently encountered as a post-operative complication of abdominal and rectal procedures, or after wounds or other injuries such as fractures of the pelvis or femur, it may follow apparently trivial injuries A number of theories have been advanced as possible explanations of the cause of the condition, most of which can be shown to be untenable. It seems most logical to suppose that the condition is due to a simultaneous inhibition of the cough reflex by some toxic or reflex stimulus in association with impairment of the respiratory muscles, either immobilization from a defense reaction or paralysis from toxic neuritis, which permits secretions to accumulate and block the bronchus, and atelectasis Neither alone is able to bring about this condition, a simultaneous occurrence is necessary for its development Roentgenographically, there is a dense consolidation corresponding to one or more lobes or to an entire lung, homogeneous in character and resembling consolidation from The narrowing of the chest on the pneumonia involved side, the approximation of the intercostal spaces, the elevation of the diaphragm, and the drawing over of the heart and mediastinal structures toward the involved side, make the condition readily recognizable The treatment consists in rolling the patient back and forth on the uninvolved side Ordinarily no other therapeutic agent is necessary In all instances (5) in which Sante has employed it, aeration of the lung has been promptly reestablished

Primary Spasmodic Dysmenorrhea and Its Treatment—C W A Emery (British Medical Journal, July 14, 1928, 11, 3523) points out that there are two factors at work in the production of primary spasmodic dysmenorrhea (1) The inability of the body of the uterus to assume the new and normal position at the commencement of menstruation (lifting of the

body as the result of increased intra-uterine tension, so as to form a continuing line through the cavity of the body and cervin, (2) the existence of too acute an angle between the body and the cervix Intra-uterine tension must overcome these factors Successful treatment depends upon increasing the intra-uterine congestion and distention so as to get as much straightening of the uterus and as great an "essential flow" angle as possible, the uterus is then made to contract in this position. First a good general tonic is administered between The author recommends the following Ferri et ammon, citratis, 1 drachm, liquoris arsenicalis, 1 drachm, aquæ chloroformi, 6 ounces, I tablespoonful three times daily after When the pain commences the patient should take a hot hip-bath and aspirin, antipyrine, or bromides Having ascertained how long the pain usually lasts, the following mixture is started a few hours before the pain ceases Liquid extract of ergot, 30 minims, potassium bromide, 5 grains (or tincture of chloroform and morphine, 3 minims), water 1/2 ounce If the pain lasts 36 hours or more, the mixture is given every two hours for six hours previous to its cessation, and then every four hours If the pain lasts about 24 hours, the mixture should be started four hours previous to its cessation If a relapse occurs it may be corrected by posterior lobe pituitary extract taken four hours before the cessation of the pain, following by the same mixture as before.

Implantation of the Adrenals in Addison's Disease -A Rinhart of Wiesbaden, states that in 80 per cent of cases the cause of this syndrome is destruction of the adrenals by tuberculosis The outcome is always fatal and until now the only benefit obtained has been from rontgen rays and limited to a few cases only at that Implantation has never been attempted although naturally it has been suggested The case tested by the author is so far as known the first on record It was typical, the patient being in an advanced stage of the cachexia Material for implantation is not rare owing to the number of tuberculous kidneys which have to be removed which comprise at least a portion of the adrenal In the present case the lower portion was removed from the kidney and at once embedded in a muscle pocket of the patient, outside the peritoneum The fragment was allowed to heal in and the wound was closed. After a latent period of a few days a remarkable reaction was seen appetite returned, the pigmented skin began to peel, and the blood pressure rose slowly from 85 before operation to 135 The amenorrhea of the patient gave way to a violent dysmenorrheic period which necessitated morphine, menorrhagia also being present Now

in which he was subprenaed, the court, as an additional punishment, may strike out his pleading" (New York Civil Practice Act, Sec 405)

As to those matters concerning which a physician is privileged to speak and those as to which his lips are sealed, we shall endeavor in a later editorial to discuss the law of that subject in detail

There is no doubt that the receipt of a subpœna works a hardship as to the person on whom it has been served. It involves the interruption of his duties elsewhere and of his life in general It is a nuisance The writer can well understand and sympathize with the feelings of annoyance which any physician or other citizen experiences when he has been subpœnaed But this subject requires a larger We hear much of "rights" We engage lawyers to defend them We are accustomed "to demand our rights," for the securing of our rights courts are instituted our free republic, the enumeration of our rights would fill many volumes, but the corollary of right is sometimes overlooked, and that corollary is duty. In consideration of our citizenship and our taxes, we expect to receive our rights but we also owe the state certain duties One of these duties, from which physicians fortunately are exempt, is that of serving upon juries. The writer is familiar with the complaints of business men when summoned for jury duty. Yet if we did not have juries, we could not have the jury system, we could not have a determination of our rights through the Anglo-Saxon method of administering justice. We have the duty of paying taxes. This also is onerous. We have the duty, in case of war of going out to defend the commonwealth by force of arms and if necessary, to lay down our lives for the republic. It is not pleasant to be bayonetted or to be shot apart by shell fire, but every able-bodied citizen of the republic may some time be called upon to endure this

The duty of obeying a subpæna is one of the duties of a citizen. It works a hardship on the citizen, on the other hand justice could not be administered without this important process. Everyone is entitled to his day in court and he cannot have it unless he can compel the attendance of those who can give evidence concerning the matters in controversy in his suit.

These suggestions may come as cold comfort, but they are in accordance with the law and in recognition of the fact that while the law protects the rights of the citizen, it demands from him the performance of certain duties

MASTOIDITIS—SINUS THROMBOSIS

The doctor was called by the parents to attend a girl five years of age An examination disclosed an acute bi-lateral middle-ear suppuration The doctor incised both ear drums and advised irrigation of the ears with boric acid solution For a time after the ear drums were incised the child's condition was improved, but one morning about two weeks after he first saw the child the mother telephoned him that the child had had a chill and her temperature had gone up to 106° doctor immediately went to see the child and made a diagnosis of bi-lateral mastoiditis and advised an immediate operation mother was undecided as to whether to permit the operation, but the doctor informed her that if an operation was not permitted he could assume no further responsibility in The mother said she would think it over, and several hours later she telephoned the doctor and told him he could operate The child was thereupon removed to a hospital where the doctor operated upon both mas-Because of the chill and rise of emperature the doctor suspected there might a thrombus in the lateral sinus, he accordingly uncovered the sinuses and found a thrombus in the right lateral sinus Pus was found in both mastoids The doctor evacuated the thrombus from the sinus and ligated the internal jugular vein The high temperature persisted and two days later the sinus was reopened and it was found that the clot had extended down into the jugular bulb The jugular bulb was opened and the clot removed from the bulb The high temperature still persisted, and several days later the sinus was opened for a third time, and the doctor found that the thrombus had extended back toward the torcular The clot was removed back as far as the mid-line of the skull was not possible to follow the clot beyond the mid-line because the interference with the blood circulation of the brain would undoubtedly have resulted in death

The child stood all these operative interventions very well, but as the high temperature still persisted, the doctor had several blood transfusions done on the child, and these transfusions improved her condition somewhat. The child was seen by the doctor two or three times a day for almost two months. On each visit the child was very carefully examined from head to foot. These examina-

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

THE SUBPŒNA-PEST OR PRIVILEGE

Among the many questions asked us by the various members of the medical profession, the one most frequently recurring relates to the subpœna "I have a subpœna here," some doctor will say, "must I go down to court and waste my time? I have an operation tomorrow morning and I can't go" Sometimes this will be varied by the statement made in pique, "I won't go"

Knowing something of the doctor's problems, the writer receives these questions and these occasional outbursts of irritation with sympathy and understanding, but his answer always is, as it must be, "Doctor, if you have been served with a subpœna, you must go'

Among the many irritations of modern life there is probably none greater than to be subpoenaed. Always this occurs at the most inconvenient moment and to a busy man never at a time that does not mean interference with the performance of his necessary work.

The subpœna reads "The People of the State of New York to 'John Brown' Greeting There seems something almost ironical in this word "Greeting" Certainly the recipient is anything but grateful And then this document continues "We command you, That all and singular business and excuses being laid aside, you and each of you appear and attend before," then follows the court where attendance is required and the date and hour "to testify what you and each of you may know in a certain action," then follows the name of "For a failure to attend" this the action document continues, "you will be deemed guilty of a contempt of Court and liable to pay all loss and damages sustained thereby to the party aggrieved, and forfeit FIFTY DOL-LARS in addition thereto" At the bottom of this awe-inspiring document appears the name of a Judge of the Supreme Court and the lawyer who has invoked the strong arm of the judiciary

The language of this document is significant and it means just what it says. A failure to obey it may render a person so failing guilty of a contempt of Court with the consequent liability to pay the damages which are sustained by reason of his faliure to attend, and in addition a \$50 forfeit

A subpæna is a "process to cause a witness to appear and give testimony" (Bouvier vol 3, p 3164. 37 Cyc 359)

Our New York statute declares that "a subpoena is a process in the name of the court, referee, body or other person authorized by law to issue the same, requiring the attendance of a witness at the trial or hearing of a cause or the hearing of a motion or before a referee or other person where proof or the production of books, papers or other documents is required" (New York Civil Practice Act, Sec. 403)

The statute defines the way in which a sub poena must be served as follows "1 The original subcepna must be exhibited to the witness 2 A copy of the subpoena, or a ticket containing its substance, must be delivered to him 3 The fees allowed by law for traveling to and returning from the place where he is required to attend, and for one day's attendance, must be paid or tendered to him" (New York Civil Practice Act, Sec 404)

The statutory fees provided are not handsome, but as this is a government of laws and not of men, the legal fees provided for are all that a witness can demand "A witness," says the statute, "in an action or a special proceeding attending before a court of record or a judge thereof is entitled, except where another fee is specially prescribed by law, to fifty cents for each day's attendance, and if he resides more than three miles from the place of attendance, to eight cents for each mile going to the place of attendance" (New York Civil Practice Act, Sec 1539) Dissatisfied with these fees, a physician in the case of Potter v Austin contended that he was entitled to more, but our New York court held that in the absence of a special agreement, he was entitled to the (Potter v Ausstatutory fee and to no more tin, 190 N Y Supp 712 [1921])

The penalty for non-attendance so ominously referred to on the face of the subpœna, is definitely provided for by law "A person so subpœnaed," says the statute, "who fails without reasonable excuse to obey the subpœna, * * * duly served upon him, * * * requiring him to attend and be examined, or so to attend and bring with him a book or paper, is liable, in addition to punishment for contempt, for the damages sustained by the party aggrieved in consequence of the failure, and fifty dollars in addition thereto. Those sums may be recovered in one action or in separate actions. If he is a party to the action

LONDON LETTER

INTERNATIONAL CONFERENCE ON CANCER

London, July 16th 20th, 1928

At the end of a busy week one has time to gain a perspective of the events which crowded this important Conference, and the first impression is one of most efficient organization This opinion was well voiced by Dr Franklin Martin of Chicago, President-elect of the Boston Congress of the American College of Surgeons, who, in congratulating the British Empire Cancer Campaign on the success of the Conference, made the very true statement "These Congresses do not arrange themselves" It was the opinion of all with whom I talked that, from the Reception, by His Majesty the King, of the International and Dominion Delegates, at Buckingham Palace on Monday morning, July 16th, to the visit to the Royal College of Surgeons, on Friday afternoon, July 20th, there was no single hitch in the arrange-

The social side began with a reception of the Delegates by Sir John Bland Sutton, President of the Congress, and Lady Bland Sutton, in their beautiful home in Brook Street, where we had an opportunity of renewing old friendships, and meeting, perhaps for the first time, men of international fame. I was delighted to meet again Dr. Max Cheval of Brussels (who had given an inspiring address to the Medical-Society of London earlier in the year), Professor Bastianelli of Rome, Professor Finsterer of Vienna, among the Continental giants, and Dr. Bruce and General Birkett of Canada, and Drs. Coley, MacCarty and Franklin Martin from the United States of America

The scientific work began on Tuesday, and meetings were held at the Royal Society of Medicine, and at its neighboring house the College of Nursing. A large gathering attended at the College of Nursing to hear Professor James Ewing of Cornell University open a discussion on the "Etiology of Cancer" It was here that Dr James B Murphy, of the Rockefeller Institute, in a paper on the "Nature of the Filtrable agent in Chicken Tumours" maintained that the causation factor was not a virus, but of the nature of an enzyme, in direct opposition to the views of Gye and Barnard, which caused so much stir three years From the bio-chemical side this was the event of the Congress, and it was seized upon by the lay press, which drew a picture of Dr Murphy awaiting with keen an liety receipt of a radiophone message from New York, to

tell him whether or not his last and conclusive experiment had confirmed or refuted his theories! When I had a chance to talk to Dr Murphy about this, he was full of admiration for the enterprise and invention of our newspaper reporters, but he regretted that there was no word of truth in it. He was quite sure that he would be hearily chaffed about it on his return to New York

After an opening address by Professor Regaud, head of the Radium Institute of Paris, on Tuesday, July 17th, at the Royal Society of Medicine, Dr Donaldson opened a discussion on the "Relative Values of Surgery and Radiation in the Treatment of Cancer of the Cervix" Sir Charles Gordon-Watson then attacked the problem from the point of view of cancer of the rectum On Thursday, the 19th, Professor Burton Lee of Cornell University, discussed the same problem as it referred to cancer of the breast, and Dr Douglas Quick, of New York, in its connection with the buccal cavity. An excellent and in some ways rather heated debate arose on Professor Blair Bell's paper on Lead Treatment, and very opposing views were held, and it is obvious that much remains to be done to obtain a less toxic agent for chemo-therapy

The last morning was devoted to two debates of great value Sir Berkeley Moynihan opened a discussion on the "Early Recognition and Treatment of Cancer of the Stomach," and Sir Thomas Horder spoke on "Diagnostic Methods in Relation to Cancer" It seemed that there is nothing new in the methods of investigation, and that earlier diagnosis must depend upon education, both of the public and profession Sir Berkeley Moynihan summed it up well when he said that cancer was at first a local disease which could be eradicated if treated sufficiently early, and the great enemy of successful treatment was the fatalism of patients suffering from the disease, and that the "fear of cancer' should be replaced by "the fear of the fear of cancer"

Every afternoon was occupied by scientific demonstrations, and operations in various hospitals. Dr Canti showed once more his Cinematograph Demonstrations of Living Tissue Cells in Vitro, and Dr McKillop, of Brisbane, tells me he has obtained a film for demonstration in Australia. It is hoped that the film will become readily available as it has unbounded educational possibilities.

Excellent work was seen at St Batholo-

1122 LEGAL

tions were directed particularly to the discovery of any metastatic abscesses in different parts of the body During this period of time the doctor called in two specialists in consultation, and they agreed with his diagnosis and treatment Several weeks later tenderness and swelling developed over the right hip A specialist called in consultation was of the opinion that pus might be present in the hip joint, and after watching the case for three or four days, the specialist incised the swelling and found a collection of pus about the hip joint The ear and neck wounds at this time had almost healed and the defendant relinquished the case, leaving the patient in the hands of the specialist who had been called in to treat the child's hip

The defendant sent the father of the child a bill, whereupon an action was brought or behalf of the infant, in which it was claimed that as a result of the defendant's careless and negligent treatment, the child sustained an in fection to her hip, necessitating four opera tions which would have been wholly unneces sary, except for the careless and negligent conduct of the defendant Damages were prayed for against the doctor in the sum of \$100,000 When the case appeared on the calendar, at the request of the plaintiff's attorney it was adjourned several times, but finally the plaintiff's attorney evidently realizing that the case was wholly devoid of merit, failed to go forward with the action, and the case was dismissed

ACNE VULGARIS-CLAIMED IMPROPER TREATMENT BY X-RAY

On September 19th, the plaintiff, a woman, called at the defendant's office The defendant was not present on that occasion and the woman was seen by the doctor's assistant, a competent dermatologist and roentgenologist She gave a history of acne vulgaris, beginning about one year before her visit and becoming progressively worse The face, forehead and chin were involved. An examination disclosed numerous blackheads and pustules on her face and numerous scars at the site of old pustules which had healed. A diagnosis was made of acne vulgaris The plaintiff was desirous of having the defendant administer X-ray treatment, since he had treated her sister for acne with X-ray with excellent results A course of X-ray treatment of one-quarter of a skin unit, according to the McKee standard of measurement, weekly for eighteen exposures was advised, the time of exposure being 45 At each treatment the X-ray tube was lowered to a point at which the centre of the target was 8 inches from the part ex-The first treatment was rendered by the doctor's assistant on September 19th The defendant first saw her on September 23rd and his examination confirmed the diagnosis and proposed treatment of his assistant Both the defendant and his assistant told the plaintiff that the X-ray treatment would not cause the scars to disappear

The plaintiff received about eighteen exposures in all at approximate intervals of a week. The machine used was a Waite & Bartlett solace model, a 10-inch spark gap was used. The X-ray treatments were rendered by the defendant's assistant under the

defendant's supervision The last treatment was rendered on January 16 of the following year The doctor's record shows the progress of the patient as follows "February 6, roughness of skin, March 6, roughness of skin gone, March 13, probably slight flattening of pits, March 20, fading and flattening continuing, April 3, nearly white (skin), May 1, pigment about faded and pitting less marked, gradual improvement up to last visit on September 18th" The treatment from the latter date until the last visit on September 18th consisted of the use of lotions containing resorcin of sulphur applied to the skin on her face

During all of the time that the plaintiff was under treatment the defendant constantly warned her against picking her face, but nevertheless she continued to do so. On the occasion of the plaintiff's last visit, the doctor advised her that further electrical treatments for the pittings of her face might be useful, but she never returned. When the X-ray treatment was completed the acne was cured and the pimples and blackheads were gone.

About two months after the patient was last seen by the doctor she brought action against him charging in her complaint that he treated her in a careless, reckless and unskillful manner, causing her face to become scarred and otherwise marred and demanding damages against the doctor in the sum of \$50,000. The plaintiff duly noticed the case for trial, but failed to diligently prosecute the same. A motion was thereupon made by the defendant's attorney to dismiss the case, which motion was granted and the action terminated in the doctor's favor.

NEWS NOTES

DISTRICT BRANCH MEETINGS

The dates and places of the District Branch meetings, so far as they have been announced are as follows

First Thursday October 18, Briarchiff Manor Third Thursday, October 4, Hudson

Fourth Friday and Saturday September 21 22, Ogdensburg

Fifth Tuesday, Octoler 9, Utica Sixth Tuesday, September 25, Elmira Seventh Thursday, September 27, Rochester Eighth Tuesday, October 2, Buffalo

Fourth District Branch — The afternoon meeting of the Fourth District Branch on Friday, September 21, will be held at the St Lawrence State Hospital, at 2 P M, with the following program

- 1 Address by Dr Harry R Trick, President of the Medical Society of the State of New York
- 2 Clinic, Medical and Surgical Cases by Dr Grant C Madill, Ogdensburg

3 Psychiatric Clinic, with presentation of cases, Staff of St Lawrence State Hospital

On Friday evening a dinner will be given in the Country Club where the members and their ladies will be the guests of the St Lawrence County Medical Society Following the dinner addresses will be given by Dr Harry R Trick, President of the Medical Society of the State of New York, and Dr Daniel S Dougherty, Secretary

A morning session will be held on Saturday, September 22 at the Country Club, at 930

o'clock, with the following program

1 Business meeting

2 "Hypertension," by Dr James Francis Roonev Albany

3 "Management of Pathologic Labors with Special Reference to Maternal and Infant Mortality," by Dr Lyman G Barton, Jr, of Plattsburg Discussion opened by Dr William M Mallia, of Schenectady

4 "Public Health Creed," by Dr W L Munson, of Granville

5 "The Relationship between Injury and Tuberculosis," by Dr Edward N Packard, of Saranac Lake

Fifth District Branch—The program of the Fifth District Branch will include a paper by

Dr Ralph Lobenstine of New York, on 'Standards of Prenatal Care,' as outlined in the leaflet prepared by the National Committee on Maternal Welfare There will also be a paper by Dr James E MacAskill, of Watertown, on "Ear Infections in Children," which will be discussed by Dr Thomas H Farrell, of Utica, First Vice-President of the State Society

Sirth District Branch—The Sixth District Branch will meet on Tuesday, September 25, at the Arnot-Ogden Memorial Hospital, Elmira The program is announced as follows

"Recent Advances in the Treatment of Fractures," by Dr Charles L Scudder, of Boston

"Some Legal Points of Interest to Physicians by Mr Lloyd Paul Stryker, Counsel of the State Society

"Studies on Breast Cancer" with Lantern Demonstration, by Dr J W Wainwright, of Scranton, Pa

"Causative Factors in Maternal Mortality" by Dr Stuart B Blakely, of Binghamton Dr J V DePorte, Director, Division of Vital Statistics, State Department of Health, Albany, N Y, will open the discussion on this paper

'The Ruptured Appendix," by Dr Arthur W Booth, of Elmira

'Some Points of Interest to the General Practitioner on Urology," by Dr Elliott T Bush of Elmira

Eighth District Branch—The meeting of the Eighth District Branch will be held at the Buffalo City Hospital on Tuesday, October 2nd—At ten o'clock there will be an inspection of the Hospital, followed by group clinics in surgery, medicine pediatrics and psychiatry Demonstrations will be given in the laboratories of Pathology and X-ray—Luncheon will be served at the new hospital cafeteria at 1 PM—In the afternoon a paper on "Modern Plastic Operations for Correction of Deformities of the Nose and Face" illustrated by motion pictures by Dr Charles B Handel, of Buffalo

2 "The Coming Generation," by Dr J Henry Dowd, of Buffalo, who specializes in diseases of the nervous system

mew's Hospital, at the Cancer Hospital, at Westminster Hospital where Mr Arthur Evans and Mr Cade showed an amazing series of cases of Buccal Cancer treated by radium, and at the Middlesex Hospital The Radium Institute also welcomed the delegates and an afternoon could be spent at St Mark's Hospital

Every delegate must have felt that the wealth of material available in London was

utilized to the greatest advantage

On the social side, two events stood out On Wednesday, July 18th, a reception was held at the London Museum, Lancaster House, and this was attended by their Royal Highnesses, the Duke and Duchess of York The fine hall of this beautiful mansion looked its best when the Duke and Duchess, taking up their position half way up the double staircase, received the Delegates and their Ladies Many of the delegates had the honour of a chat with the Royal visitors, and I came away with an unforgettable picture of the great Italian Surgeon, Bastianelli, long, thin and grave lined face with its scanty beard, engaged in animated conversation with our beautiful young Duchess

A very different, if equally happy event, was the dinner given to the Delegates on the next evening by the Staff of the Cancer Hospital Mr Ernest Miles, Senior Surgeon to the Hospital, made an ideal Chairman, and the speeches were excellent for their wit and brevity. Those who accepted the Chairman's tip for the Eclipse Stakes, were not perhaps so happy next day, but racing presents as many difficulties in prognosis as cancer itself, and much may be forgiven. After dinner Sir Berkeley Moynihan, Dr. Murphy and I fell to

talking about the other Murphy—the fine teacher and master surgeon of Chicago, and tales were told of his amazing courage in the face of ill health, of his enthusiasm and the loss his death had meant to surgery. Thus the talk ran on, as talk does, till Dr. Murphy was telling us about his old home in Virginia, which had passed down in the family since the first colonising in the 17th century, and the tales of the old communal life on the farm with slave labour. A happy evening, and one to which the Cancer Hospital can look back with satisfaction.

And so the Conference drew to its close What has been accomplished and what are the lessons it has taught us? One is impressed by the diversity of the methods of investigation and attack upon the great problem, and by the enthusiasm and good fellowship of those engaged in this great research We have not yet solved the problem of causation, but doubtless the work of Murphy will set many able minds to search along a new avenue The outstanding feature, in my opinion, is the evidence of the increasing value of radium in the treatment, not only of advanced and recurring cancer, but in the early stages also battle between radium and the knife is set, and one cannot yet tell whether radium will oust the knife altogether or whether they will unite against the common foe There is great need for more radium, and it is a sad fact that the whole supply in this world is dependent on supplies obtained from one area, the Belgian Congo The cost, £12 per miligramme, is a serious consideration, and it is estimated that England alone requires £250,000 worth a year

H W CARSON, FRCS, Eng

A HEALTH DEPARTMENT FOR SUFFOLK COUNTY ESTABLISHED

From the September Issue of the Monthly News Letter of the Suffolk County Medical Society

The Board of Supervisors of Suffolk County, at its regular monthly meeting on August 27, unanimously voted to establish a county department of health in accordance with Section 21-B of the Public Health Law Suffolk County is the second county in New York State to establish a county department of health the only other one being that of Cattaraugus County, which was The Suffolk County pùt in operation in 1923 Department is the first one to be established as the result of a spontaneous movement originating in the county itself, and developing to its full fruition without extraordinary aid except from the State Department of Health which will exercise some degree of authority over it, principally in the way of maintaining standards

The Suffolk County method of establishing the department is in direct contrast with that of Cattaraugus County where a wealthy organization -the Milbank Fund,-offered to finance the Department with over \$100,000 for only five years The published intention of the trustees and operators of the Milbank Fund was to demonstrate how a county department of health could be run as a model for other counties throughout the State and Nation The Demonstration was planned by experts from outside the county and was modeled after that of a large city ployes of the County Department of Health were largly from outside the county and even the Moreover, the local health officers and physicians were consulted only to a minimum degree, and they were scarcely mentioned in the reports of the work of the department

The County Department of Health of Cattaraugus County stands in contrast with that of Suffolk County where the local physicians originated the plan and secured its adoption after a quiet campaign of less than two years The success of the campaign of Suffolk County is a vindication of the attitude of the officers of the Medical Society of the State of New York and its committee on Public Relations, in urging physicians and other county citizens to assume their proper leadership in every public health movement. The physicians of Suffolk County have not only suported all local movements for the practice of public health and civic medicine, but they have originated many of these movements and have asked the voluntary health workers to promote them

The aspirations of the physicians of Suffolk County to establish a county health department first took concrete form on October 8, 1926, when the annual meeting of the Suffolk County Medical Society adopted the following resolution for unanimous vote

"Resolved, that the Suffolk County Medi-

cal Society go on record as favoring the cs tablishment of a county department of health under a full-time health officer

On January 10, 1927, the County Tuberculosis and Public Health Association at its annual meeting, discussed the county health department proposition and voted to adopt its promotion as a major activity

The Comitia Minora of the County Medical Society held its regular meeting on January 26 The principal subject that was scheduled for discussion was the milk situation in Suffolk Physicians from various parts of the county reported on the varying degrees of enthusiasm with which the boards of health of villages and towns throughout the county supervising public milk supplies and the great number of overlapping jurisdictions was emphasized This brought up the problem of the proper co-ordination of the twenty-three health officer districts of the county There was a unanimous agreement of the physicians present that the only solution of the problem lay in the establishment of the county health department The following resolution was therefor unanimously passed

"Resolved that the Comita Minor of the Suffolk County Medical Society instruct the Committee on Public Health to make a formal appeal to the Board of Supervisors of Suffolk County to establish a county department of health with a full-time health officer, and, further, that the Committee seek the cooperation of civic bodies interested in public health"

The members of the Suffolk County Medical Society continued their campaign by the method of informal talks with supervisors and other officials, and also organizations such as boards of trade and Parent-Teachers Associations. They met with a favorable response, and sentiment rapidly developed in favor of the proposed county department.

On February 24, 1927, Governor Alfred E Smith held a conference of the chairmen of the boards of supervisors of several counties for the purpose of promoting a general movement for the establishment of county units. He told how the State had made provision to pay half the cost of the departments and showed how the departments were a part of a general plan for consolidating the innumerable governmental agencies and regrouping them into units suitable for efficient demonstration. Dr. Matthias Nicoll, Jr. State Commissioner of Health, outlined a budget showing that the annual cost of conducting an efficient county department of health would be about \$25,000 of which the State would pay

GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

The program of the lectures in the Graduate Fortnight of the New York Academy of Medicine is as follows

The Heart and Bloodvessels

October 3rd—The aging of the heart muscle regarded from a general biological point of view, Dr Alfred E Conn, Rockefeller Institute.

October 11th—Angina pectoris, Dr Harlow Brooks, Professor of Clinical Medicine, New York University October 10th—Hypertension, Dr Herman O Mosenthal, Director Department of Medicine, Post Graduate Medical School and Hospital.

October 3rd—Arteriosclerosis and aneurism, Dr E J G Beardsley, Associate Professor of Medicine, Jefferson

Medical College

October 11th-The Myocardium, Dr John Wyckoff, Clinical Professor of Medicine, New York University October 9th-Diseases of the arteries of the extremities, Dr Leo Buerger, Attending Surgeon, Bronx Hospital

The Digestive Tract

October 11th—Digestive Problems, Dr Thomas R Brown, Associate Professor of Clinical Medicine, Johns Hopkins University

October 12th-Liver and biliary passages Dr Franklin W White, Instructor in Medicine, Harvard Univer-

sity

October 5th—The conditions of the rectum in old age, Dr Jerome M Lynch, Professor of Rectal and Intestinal Surgery, Polyclinic Medical School and Hospital

The Respiratory Tract, Infectious Diseases and Climate

October 8th-Pneumonia in old age

October 8th-Bronchitis and asthma, Dr Frederick T Lord, Boston, Mass

October 8th—Tuberculosis, Dr Lawrason Brown, Saranac Lake, N Y

October 8th-Climate and the aged, Dr Gerald B Webb, Colorado Springs, Colo

October 11th-Infectious diseases and old age, Dr Rufus I Cole, Director Rockefeller Institute.

Surgical Problems-Bones and Joints

October 1st—The treatment of arthritis deformans of the hip, Professor Vittorio Putti, Institute Rizzoli, Bologna, Italy

October 5th-Osteomalacia and Paget's disease, Dr Edwin Allen Locke, Clinical Professor of Medicine,

Harvard University

October 11th—Arthritis and old age, Dr Russell L Cecil, Visiting Physician, Bellevue Hospital

October 5th-Traumatic surgery and the problems of age, Dr John J Moorhead, Professor of Traumatic Surgery, Post Graduate Medical School and Hospital

Pathological Processes, Neoplasms, X-ray and Radiology

October 2nd—Importance of anatomical pathways in diseases of middle life and old age, Dr. Harrison S. Martland, City Hospital, Newark.

October 9th—Special aspects of neoplasms in the aged,

Dr James Ewing, Professor of Pathology, Cornell

University

October 1st-Family variations in cancer susceptibility, Dr Alfred S Warthin, Professor of Pathology, Uni-

versity of Michigan

October 9th-X-ray and radium in the problem of old age, Dr Francis Carter Wood, Director of Radiological Therapy, St Luke's Hospital

General Care, Dictetics, Pharmacology

October 2nd-Clinical aspect and management of old

age from the practitioner's point of view, Dr Charles Collins, New-York City

October 4th—Dietetics in old age, Dr Samuel A Brown, Professor of Pharmacology, New York Unit

October 4th-Alcohol in old age, Dr Samuel W Lam bert; President New York Academy of Medicine.

October 2nd-Postponement in the individual process of aging, Dr Linsly R Williams, President New York Tuberculosis and Health Association.

October 5th-Food and food habits, Dr Solomon Strouse, Associate Professor of Medicine, Rush Medical College, University of Chicago

Syphilis and Diseases of the Skin

October 2nd—Syphilis in elderly persons, Dr George M McKee, Professor of Dermatology and Syphilology, Post Graduate Medical School and Hospital

October 2nd-Disease of the skin in old age, Dr How ard Fox, Professor of Dermatology, New York Univer

The Brain and Nervous System

October 9th-Aging of the human brain, Dr Fred erick Tilney, Professor of Neurology, Columbia Un-

October 9th-Apoplexy, Dr Bernard Sachs, Consult ing Neurologist, Mt. Sinai Hospital

October 3rd—Arterial diseases of the brain and cord, Dr Foster Kennedy, Professor of Clinical Neurology, Cornell University

October 3rd—Spinal cord diseases, Dr Edwin G Zabriskie, Attending Physician, Neurological Institute

October_8th-Psychoses in old age, Dr Menas S Gregory, Director of Psychopathology, Bellevue Hos pital

The Ductless Glands, The Menopause

October 4th—The relation of disorders of ductless glands to senescence, Dr William Engelbach, Engelbach Clinic, St Louis

October 4th—Menopausal and post-menopausal conditions in women, Dr Benjamin P Watson, Professor of Obstetrics and Gynecology, Columbia University

The Biology of Old Age

October 3rd—Biology of Old Age, Dr Alexis Carrel, Rockefeller Institute

October 10th—Senescence and rejuvenescence from a biological standpoint, Professor C M Child, University of Chicago

October 10th—Present status of the problem of the socalled rejuvenation, Dr Charles R. Stockard, Professor of Anatomy, Cornell University

The Kidneys and the Genito-Urinary Tract

October 10th-Nephritis in old age, Dr Nellis B Foster, Associate Professor of Medicine, Cornell University

October 5th-Urological problems, Dr Joseph F Mc-Carthy, New York Post Graduate Medical School and Hospital

October 12th—Diseases of the eye in old age, Dr William H Wilmer, Professor of Opthalmology, Johns Hopkins University

October 12th-Carcinoma of the larnyx Dr John L. MacKenty, Senior Surgeon, Manhattan Eye, Ear and Throat Hospital.

No fee will be charged for attendance on any of the meetings or clinics A copy of the program of the clinics will be mailed on request

REFERENCES TO COUNTY DEPARTMENTS OF HEALTH IN NEW YORK STATE JOURNAL OF MEDICINE

THE NEW YORK STATE JOURNAL OF MEDIcine has not carried many references to county to start a county health department, editorial departments of health because the conception is comparatively new There has been only one county department of health in existence in New York State, and that one has not been wholly approved by the medical profession However, the example of Suffolk County, in which the medical profession has secured a county department of health will be an example which other counties will doubtless emulate Physicians will therefore be interested in the following references to county health departments contained in THE NEW YORK STATE JOURNAL OF MEDICINE

- 1 November 15, 1926, page 953, Tompkins County plan of a county department of health
- 2 December 1, 1926, page 985, editorial on a plan for a county department of health proposed by the State Department of Health
- 3 January 15, 1927, page 71, County Health Officers, editorial
- 4 March 15 1927, pages 314 and 322, Governor Smith's Conference on County Health Departments
- 5 May 15, 1927, page 563, Suffolk County plan for a county department of health

- 6 July 15, 1927, page 786, conference on how
- 7 August 1, 1927, page 848, physicians' relation to county health departments
- 8 November 15, 1927, page 1272, Monroe County Medical Society, discussion
- 9 January 1, 1928, page 27, Principles of County Health Department
- 10 January 1, 1928, page 37 Discussion in Committee on Public Health and Medical Education, sub-committee authorized to study county health departments
- 11 August 15, 1928, page 1016, training county health officers in the Southern States
- September 15, 1928, establishment of a county health department in Suffolk County

Also, reterences have been made to the county health department of Cattaraugus County, notably the special issue of July 1, 1926, describing the county health department from the point of view of the Milbank Demonstration

The counties of Cortland and Rockland also gave serious consideration to the establishment of county health departments, but no record from either county reached THE JOURNAL

MEDICAL SOCIETY COUNTY OF QUEENS OUTING MEETING

A regular meeting of the Medical Society of the County of Queens was held at the St Albans Golf Club, St Albans, Long Island, on June 4th, 1928 President F G Riley, MD, in the chair This was the annual outing meeting of the Society and was held in affiliation with the Medical Association of the Greater City of New York It was preceded by a golf tournament At 6 30 P M the Society partook of dinner served by the Club

The executive session was called to order at 8 30 P M, and was adjourned to follow This was prethe address of the evening sented by Amos Osborne Squire MD, formerly Chief Physician of Sing Sing Prison, who spoke most interestingly and instructively on "Crime and Criminals" At the close of the adrress, the Society again entered into executive session

The Chairman, E. A. Flemming, M.D., reported for the Censors and moved the election

of the following approved by the Censors for Active Membership-Edward M Gould. M D, 8336 Victor Avenue, Elmhurst, Hyman Harberg, M.D., 3758 103rd Street, Corona. Oscar Kaltner, M.D., 612 13th Street College Point John Edward Lowry, M. D., 180 Barclay Street Flushing Associate Membership (Internes)-Lawrence Breitbart, MD, Flushing Hospital, Benjamin Grossman, M.D., Flushing Hospital

On motion they were elected by ballot cast by the Secretary

Dr T C Chalmers, Chairman of the Board of Trustees, then gave an extensive presentation of the plans of the new building and announced that signed pledges have been received up to date to the amount of \$100,050 00 with promises for \$22,000 00 additional

The meeting thereupon adjourned Attendance at meeting, 48

E E SWITH, Secretary

half But unfortunately the Department of Health of Cattaraugus County was upheld as an ideal department, and its cost was over \$100 000 annually. This question of cost was a difficult one to handle. Although the doctors felt that a budget of \$25,000 was sufficient, yet a considerable amount of investigation and education would have to be done in order to convince the supervisors that Dr. Nicoll was right in his estimate of a sufficient budget.

The Suffolk County Dental Society also took an active interest in the proposed county department of health, and cooperated activity with the physicians both by individual efforts and also by society action. The movement was also endorsed by the Long Island Veterinary Association, thus putting all the medical and allied professions in

its favor

The principal public means of promoting the county department of health was the monthly News Letter of the Suffolk County Medical Society, which is also sent to over 1,000 citizens interested in public health work, and is widely quoted in the county newspapers. Nearly every issue of the publication contained articles of the proposed county unit, its activities and its cost. The physicians felt that a dignified presentation of their plans in their own publication would be the most effective way to promote the proposed department, and events justified their decision.

Sentiment in favor of the county department of health grew steadily with no opposition. The presentation of the formal request for the establishment of the department was purposely delayed until civic leaders and members of the Board of Supervisors began to say to the doctors.

Board of Supervisors began to say to the doctors 'When are you going to ask for the department?" This attitude indicated that the time was ripe to present the formal request to the Board of Supervisors, and so on February 24, 1928, the Comitia Minora of the County Medical Society and the local health officers of towns and villages met in a joint conference and voted unanimously to instruct the Public Health Committee of the County Medical Society to go before the Board of Supervisors at its meeting on Monday, March 26, and request the Board to establish a county depart-The Public Health Committee ment of health consulted members of the Board of Supervisors regarding the manner of the presentation of the request before the Board The plan adopted and carried out was that the formal request should be presented by three speakers only agreed that the speakers should carefully prepare their remarks in writing in order that the request might be made as concisely and accurately as possible, together with an outline of the reasons for the request

Dr Frank Overton, Chairman of the Public Health Committee of the Suffolk County Medi cal Society, made the formal request on behalf of the local and allied professions of view of the Suffolk County Tuberculosis and Public Health Association was presented by Dr W H Ross, President of the Association The relation of the State of New York to the county health unit was described by Dr Matthias Nicoll, Ir, State Commissioner of Healthi Dr L C Scudder, DDS, also appeared before the Board as a representative of the Dental Society The presentation of the subject consumed only twenty minutes of time, and at its close the Board voted to accept the request and to refer it to its legal committee for investigation and report

The Legal Committee of the Board of Super visors conducted a quiet investigation regarding the merits of the county unit and the sentiment regarding its establishment, and found no opposition, although abundant time was given for it to The members of be expressed if there was any thé committee showed their entire confidence in the physicians and consulted them freely and fre-The committee reported favorably at quently the meeting of the Board of Supervisors on July 30, and at the next meeting held on August 27 the Board unanimously adopted the formal resolution which had been prepared by the Legal Committee, establishing the county department of

health for Suffolk County

This is a brief outline of the events covering a period of twenty-two months, during which time the proposition of a county health unit was actively promoted by the physicians, dentists, and veterinarians, and also by the voluntary health organizations of the county, all of which fol-

lowed the leadership of the physicians

The program of the physicians was carried to the successful conclusion because the physicians, dentists, and veterinarians were all united on a definite plan of action, and were willing to assume the leadership and responsibility for its establishment. The example which their set is a model for the medical profession of other counties to follow in securing the establishment of county health units in other counties throughout New York State.

A considerable amount of work must yet be done in order to complete the organization of the county department of health and put it in motion, but the details will be readily arranged now that all the public health forces of the county have agreed to its establishment

MEDICAL WARES

CAMERAS THE ELEMENTARY PRINCIPLES OF THEIR ACTION

Doctors are interested in cameras on account of the personal pleasure and satisfaction which they bring, as well as their scientific value Physicians travel more widely than any other group of educated persons and come into intimate contact with bits of scenery, picturesque persons, and scientific objects. The camera affords the ready means of recording all these impressions in a form which gives lasting pleasure to the physician and his friends.

What kind of a camera shall a doctor buy? He does not want an elaborate 8x10 or 5x7 outfit of the professional photographer. He wants a portable camera which he can carry easily and have ready for instant use. Most of his photographs will be snap shots taken under conditions requiring prompt action with little preparation. A brief consideration of the elementary principles of a camera will therefore be of value.

Two tests are usually applied to a photograph (1) The sharpness of its lines, (2) its contrasts of light and shade

A standard test for a photograph is the fineness of its lines, or its adaptability for enlargement. The lens of the best standard camera will produce a photograph similar to a pen and ink drawing, whose lines are 1/250 inch broad, but a photograph will still be fairly sharp if its lines are 1/100 inch broad. One may test a snapshot by examining it with a magnifying glass. The lines of a first-class photograph will still appear sharp when it is examined with a hand lens magnifying three to five times. A photograph must conform to this test if it is to be used in making an enlargement.

A second test of a good photograph is its contrast of light and shade. The dark parts of a good snapshot will be black and the light parts white, while the other parts will show a gradation of range of grays between black and white. The contrast is dependent principally on the amount of light falling on various parts of the photographic plate. A good camera will have facilities for admitting the proper amount of light under all ordinary conditions.

A practical snapshot camera, suitable for bringing out the qualities of sharpness and contrast will have four characteristics

- 1 A short focus lens
- 2 A lens with a light diameter
- 3 A shutter with a wide range of speed,
- 4 Facilities for focussing

The image within a camera will move before a sensitive plate when (1) the object photographed

is moving or (2) the photographer moves the camera while he is taking the picture. The shorter the focus length of its lens, the less will be the motion of the image on the plate. It is difficult to hold a camera in the hand so firmly that no motion is produced. There will at least be a trembling caused by the contraction of the muscles. It is a rule that a camera with a focal length of 5 inches is about the limit of one which can be held firmly

A photographer cannot always choose his light, and so he needs a lens with a large diameter. The size of a lens, or the amount of light which it will admit, is indicated by the ratio of the lens to its focal length. A modern lens of high grade will have a focal length 35 times its diameter and such a lens will be marked with a symbol f 35. The best lens will be marked f 8, while those in the cheap brand of camera will be marked f 11. Since the amount of light admitted by lenses will fall as the square of the diameter a lens rated at f 35 will admit forty times more light than one rated f 11.

The most practical lens of the high class camera will be one marked f 3 5 but it will have a diaphragm for reducing the size of its opening to f 16 or f 32, for use in a strong light, or for more accurate focussing

A physician will usually want a shutter having a range of speed from one-half a second to one one-hundredth of a second, in order to adjust the exposure to the subject. If the subject is moving, the photographer will use a lens of large diameter, with a rapid exposure, but if the object is still, he will prefer to use a lens with a smaller opening and give the photograph a longer exposure

A good snapshot camera will also have facilities for focussing the lens according to the distance of the object from the camera If an object 50 feet away is in short focus, another object 10 feet away will not be in sharp focus Although the fuzziness of the lines of the nearer object may not be objectionable, yet the photograph cannot be enlarged A camera with what is called a "fixed focus lens" has a lens of a short focal length and a small opening . While it produces excellent results under ideal conditions of distance and light vet the camera has such grave limitations that a physician is not likely to be satisfied with it

These are some of the elementary principles which one must know in order to understand a camera and take photographs under a wide range of conditions of light and shade

VIRGIL PENDLETON GIBNEY MEMORIAL FELLOWSHIP OF THE HOSPITAL FOR RUPTURED AND CRIPPLED

Through the generous contributions of the Alumni and friends of the Hospital for Ruptured and Crippled, a fellowship has been established which will be known as the Virgil Pendleton Gibney Memorial Fellowship

The income from this fellowship will be approximately \$1,500 a year, and the incumbent thereof will have the privilege of boarding and residing at the hospital

The idea of the fellowship is to afford an opportunity to a man who is well-grounded in general surgery and who has had a certain amount of experience in orthopaedic surgery, to pursue further study in the latter field, especially in that of bone pathology. The incumbent will have every opportunity for clinical study in both the indoor and outdoor departments of the hospital. He will have the privilege of carrying on laboratory investigations at the Cornell University Medical College under the direction of the heads of the departments, and also will have an opportunity to study the pathology of bone tumors under the direction of Dr. James Ewing of the Cornell and Memorial Hospital laboratories.

After a period of not exceeding three months, the incumbent shall decide upon some particular line of study and investigation to which he intends to devote the major portion of his time. At the end of one year, or of the period during which he has held the fellowship, he shall present to the Committee in Charge, a thesis which will be published as coming from the Hospital for Ruptured and Crippled and the Cornell University Medical College Laboratories, with the approval of the committee

The committee in charge of this fellowship consists of the following Mr William Church Osborn, President of the Board of Managers, Dr Samuel Fosdick Jones of Denver, Colo, Dr Eugene H Pool, Dr Royal Whitman, Dr Charlton Wallace, and Dr William B Coley, Chairman

Anyone desiring to apply for this fellowship should communicate with Dr William B Coley at the Hospital for Ruptured and Crippled, 321 East 42nd St., New York, N. Y.

MEDICAL LIBRARY ASSOCIATION

The Medical Library Association, whose membership is drawn from the United States and Canada, held its annual meeting in the New York Academy of Medicine on September 5, 6, and 7, 1928. Its president is Dr Archibald Mallock librarian of the New York Academy. About seventy-five delegates were in attendance. The discussions were of unusual interest and were of special value to physicians who frequently use medical libraries.

Dr Robert L Dickinson of New York, member of the Committee on Medical Nomenclature,

discussed the standardization of nomenclature of conditions and diseases

Dr Frank Overton, executive editor of the New York State Journal of Medicine, spoke on Indexes and Abstracts, with special reference to the State journals, and their relation to the great medical movements in which physicians and their medical societies are engaged. This paper will be published in the next issue of this Journal.

The papers presented before the Association will be printed in its quarterly bulletin

THE DIRECTORY

Just as the copy for the annual *Directory* of New York, New Jersey and Connecticut is nearing completion, there comes word of the installation of new exchanges, and of new methods of listing numbers of business houses, especially in New York City—The only practical method of securing data regarding these changes is that the

physicians themselves shall inform the State Society of any changes in their own telephone numbers

Please send notice of these changes as soon as possible. Those made after October first will not only involve great trouble and expense, but may also delay the publication of the directory.

patient with nauseating medicines. On the next they will write the recipe for an appetizing concoction that is just as good for him as if it tasted like poison. It is amusing to think of doctors and nurses in hospitals chatting about something besides anatomy and operations. They will be able to exchange notes like two housewives.

"Women are certain to approve this new proj-

ect at Johns Hopkins They will hope that the idea will spread, so that not only medical schools but all colleges will include cooking classes for men And men, too, will probably like the plan With so many women devoting themselves to business, it would not be a bad scheme to teach prospective husbands how to fend for themselves in the home"

DAMAGE BY NOISE

The newspapers of New York have frequently carried articles on noise and its suppression. A large amount of investigation has been made in recent years into the nature and effects of noise, the assumption being that noise is a major evil, especially in cities. However, an editorial in the New York Tribune of September 2 sets forth a pessimistic view and says.

"Once more propensity for jumping at conclusions is evident in circles which should be free from it Dr Max Mailhouse, of Yale, is credited by news reports with the statement that noise costs the United States \$5,000,000 a week. This is not the first time that such statements have been made, but it ought to be the last. No man, professor, committee, soothsayer or professional prophet is able to say one solitary thing with any validity in it about the cost of noise, if any

"The Committee on the Elimination of Harmful Noise, an American agency created by the National Safety Council, has carried out incomparably more actual work on noises than all other agencies put together. It is on record to the effect that estimates of the cost of noise, directly

in hampered business or indirectly in damaged health, are entirely impossible at present and can be nothing but wild guesses, likely to be misleading and to do harm to really effective action toward noise prevention

"It is possible to be more definite about the purchase price of quiet. Analyses have been made of the sources of New York City noise and of how these vary from hour to hour of the day. It may be said with certainty that New York could be made as quiet as any country village. The only obstacle is cost. Very crude and tentative estimates, although more accurate ones than are possible for the supposed cost of noise, indicate that the quieting of New York might add 25 per cent to the average cost of living in the city and might reduce day-time population of Manhattan by 10 per cent. Is it worth while? Evidently the citizenry thinks not, and there is no engineering data to prove it wrong."

It is hoped that the committee may come to scientific conclusions regarding noise, and make practical suggestions for controlling and enduring it

THE END OF THE WORLD

Doctors who have a metaphysical turn of mind, or deal with patients having a similar mental tendency, will be interested in the following discussion on the end of the world given by Dr Robert A Millikan, physicist of the California Institute of Technology and discoverer of the Cosmic Rays described in this department of The Journal of April 1, 1928 Speaking before the Society of Chemical Industry, Dr Millikan said

"There is no danger of the earth disintegrating, and millions of years from now the chief constituents of the earth will be just what they are today—hydrogen, oxygen, silicon and iron. The sun will maintain its position as the source of energy used by man, or possibly another sun will come into being when the one we now have

"The recent exact measurement of the amount of lead in the Black Hills uraninite, and of the exact atomic weight of that lead, is not usually regarded as a great engineering undertaking nor as an accomplishment fraught with important useful consequences, but I venture the estimate that the knowledge that has come from that and similar experiments, to the effect that this world already has had a lifetime of at least a billion years and that man has, in all probability, another billion years ahead of him in which there is the possibility of his learning to live at least a million times more wisely than he now lives, is likely to have in the long run a much larger influence upon human conduct than the invention of either the airplane or the radio, important and preeminently useful though these be"

THE DAILY PRESS

STREET CONGESTION AND HEIGHTS OF BUILDINGS

The New York Times of July 19 discusses a strange suggestion of H D Simpson of the Economics Department of Northwestern University that the heights of buildings does not increase street congestion as rapidly as one would suppose, as follows

"In the pure type of Main Street city, with all the business located on one street and all the traffic to and from this business traversing that one street, 'no one would be guilty of supposing that the building height could have any effect on pedestrian traffic one way or the other'

"The professor comes finally to the conclusion that if a equals the amount of traffic with a given building height, b the factor of increase in building height, and v the amount

of traffic with the increased building height, then ι equals a multiplied by the square root In other words, pedestrian traffic will vary not in proportion to the two different heights, but in proportion to their square roots Much the same reasoning would apply to vehicular traffic If Mr Simpson is correct, traffic congestion resulting from a nine-story building will never be more than three times as great as traffic congestion caused by a onestory building As a practical matter there comes a point where the evil effects of congestion increase in geometrical progression Mr Simpson suggests wider streets if you have already stretched them to the limit? It is to be feared that he has brought to the controversy not peace but a sword"

THE FLOPPER

The floppers are the bane of ambulance doctors and receive small mercy when they are detected. The New York *Herald Tribune* of July 16 says editorially regarding them

The 'flop' technically speaking, is a fake fall on which may be based a claim for damages. The 'flopper' pretends to trip over an obstruction or defect in his path for which some one may be held legally responsible and then turns his 'claim' over to a firm of lawyers who do the collecting and either pay him a salary for his performances or split the proceeds with him. As in other callings, there are 'floppers' who attach themselves to individual employers, and free-lance 'floppers'. The latter may be considered the aristocrats of the profession, though sometimes they have difficulty in maintaining their status, as do free-lance professionals the world over

Proficient in their art, they lack the business acumen necessary to market their services to the best advantage

"Mr Irving Fuhr, for example, has described on the stand in the investigation of ambulance chasing how he formed a partnership with one Bernard Deutsch and sold their 'claims' to a Moses Cohen But after giving Cohen about seventy-five flops, he says, they decided he was cheating them, and rather than stand for that went back to their former employers on a salary basis. Fuhr said he did about 150 flops in four months for a salary of from \$50 to \$75 a week. Not an income to dazzle the imagination, but then to the true craftsman it is not the money reward but the pride in his product that keeps him wedded to his work."

PRESCRIPTIONS FOR DIET

If doctors had to prepare the dishes which they glibly prescribe, and then had to eat them, they would probably pay more attention to scientific dietetics. The New York Times of September fifth discusses this subject editorially as follows

"Diet is important in the treatment of disease Johns Hopkins has recognized this fact by making a course in cooking part of the fourth year work of medical students. In the classes at

Johns Hopkins the young men will learn not only why hemoglobin regeneration occurs when liver is fed to an anemic patient but also how to prepare it to get the most value. Why the price has gone up is not required to be taught. The young doctors of next year will be able to give intelligible instructions for cooking the food they prescribe. On one leaf of their pads they will scribble the hieroglyphics which provide the

various groups of streptococci is that of complete and full photographic records of plates and colonies at various ages of the culture 57 clear photographic records of plates and colonies representing the five main groups described by the authors accompany the volume together with Dr Warren Crowe's colored plates of colonies of the various types of streptococci

As a whole, this volume is a masterly piece of work and may be considered the last word on the subject

SILIK H POLAYES

BABY'S HEALTH DAY BY DAY 16 mo Chicago, The Professional Press, Inc., 1928

A book useful to mother or nurse of the baby, for recording its daily feeding and hygiene schedule, and

its weekly progress

At the end of the book are appended brief instructions on Breast and Bottle Feeding, Infant Hygiene, First Aid, Food Preparation and Recipes The book is to be commended for its advice to call the physician early, and its discouragement of lay treatment of illness

PYELOGRAPHY ITS HISTORY, TECHNIQUE, USES AND DANGERS By ALEX E ROCHE, MA, MD, Octavo of 118 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$350

This little work of about 100 pages is well balanced and comprehensive, and the text is clear and concise. We are surprised to learn, that, to the author's knowledge, this is the first book on this subject published in Europe. The subject matter is replete and complete with the many details so essential in this field based upon fifty-eight personally observed cases, at the St_Peter's Hospital

The first chapter outlines an interesting survey of the history of the development of the art Each chapter is followed by a summary, and numerous excellent il-lustrations with case records attached, are given

Every student of Urology should own and frequently refer to this book, since it contains a store-house of facts which require Urologists years to learn by clinical experience. It is interesting to note that the author employs 30% sodium iodide for opaque medium in contrast to a 12 to 13% solution usually employed in this country

One can not avoid noting that the majority of the writer's references are those of American authors AUGUSTUS HARRIS

A Synopsis of Physiology By A. Rendle Short, M D and C I Ham, M B., Ch.B 12mo of 258 pages, illustrated with diagrams New York, William Wood and Company, 1927 Cloth, \$3 50

The authors present this synopsis for the use of surgeons taking the examination for the Royal College, and for the use of teachers, and such others as may want the knowledge of physiology without the literature. The aim has been admirably accomplished, and it would be difficult to find the facts of physiology more succinctly stated than in this presentation It makes a very convenient desk book in answer to the many questions asked by patients the answers of which we are not just quite sure. The authors supply the answers conveniently

J Arthur Buchanan

A\ ELEMENTARY LABORATORY GUIDE IN GENERAL BACTERIOLOGY
By HAROLD J CO\N Octavo of 165 pages illustrated
Baltimore, The Williams & Wilkins Company, 1927
Cloth, \$3 00

This book can be used as an accompanying guide following any standard text book of bacteriology. It contains brief instructions on the general bacteriologic methods and is, therefore, an ideal guide for students of elementary classes. The author commences with a short chapter containing practical information on the preparation of glassware and its proper handling. This is followed by outlined exercises which are as helpful

to the instructor in planning the course as they are to the student who is learning them. Among the subjects studied in these exercises are the microscopic examination and the preparation of pure cultures of pathogenic and non-pathogenic bacteria, making media, the com-mon molds (with impressive diagrams), the effect of external conditions on bacteria, the practical anaerobic culture methods (with illustrations), the common pre-servatives and germicides, the study of yeast, im-munological reactions, and the sanitary analysis of water

The appendix contains, in tabulated form, the composition of media used, the common stains, a glossary of terms used, and the practical methods of determining the reaction of media and the hydrogen ion concentration, with illustrative tables

This book is well indexed and contains references which should enlighten the student on the various questions which the exercises may suggest

S H POLAYES

FOOD AND HEALTH An Introduction to the Study of Diet By A BARBER CALLOW 12mo of 96 pages, illustrated London and New York, Oxford University Press, 1928 Cloth, \$100

This little book is one of a series of manuals of introductory scope for general readers and students who desire a small volume written in simple style. Chapters deal with the chemical nature of foodstuffs, digestion, vitamins, rickets, choice of food and arrangement of diet. There are tables showing the common foodstuffs that are rich in vitamins and analyses and energy value It is well written and gives a good general ts subject W E. McCollon of food idea of its subject

APPENDICITIS By THEW WRIGHT, A.B., M.D., 12mo of 129 pages, illustrated New York, Allen Ross & Company, 1928 Cloth, \$200

This work appears in a single volume of 129 pages containing two illustrations The aim of the author is to place in the hands of the laity the fundamental and important facts concerning the symptomology, the methods of prevention, the treatment and the after effects of the disease. It is in no way intended as a text book for students or the medical profession.

There are 11 chapters as follows

There are 11 chapters as 10110ws
Introduction, Chapter 1, Anatomy, Chapter 2, Function of the Appendix, Chapter 3, Diseases of the Appendix, Chapter 4, Symptoms of Acute Appendicitis, Chapter 5, Complications of Acute Appendicitis, Chapter 6, Chronic Appendicitis, Chapter 7, The Treatment of Appendicitis, Chapter 8, Experiences Following Operator Chapter 9, Appendicitis in Children Chapter 10 eration, Chapter 9, Appendicitis in Children, Chapter 10, Means of Prevention, Chapter 11

Éach one is written in a plain, non-technical manner, the text of which can be readily interpreted greatest purpose served by a book of this sort is to urge the reader to recognize the early and incipient symptoms of the disease so that they may not be regarded as those of a simple medical condition

The keynote of the book is to call a competent registered physician in any case in which the symptoms of abdominal distress suggest the possibility of appendicular MERRILL N FOOTE.

PRACTICE OF MEDICINE. A Manual for Students and Practitioners By Hughes Dayton, MD Fifth revised Edition 12mo of 340 pages Lea and Febiger, 1928 Cloth, \$2.25 Philadelphia,

This is a short symposium covering very briefly most of the medical diseases. It is a book for very hasti reference only and probably will be used frequently by students as a brief outline for review The text is most superficial and many of the statements are very sketchy in detail and accuracy The demand for a book of this type is, of course very limited

IRVING L CABOT

BOOK REVIEWS

DF LAMAR LECTURES, 1926-1927 The Johns Hopkins University School of Hygiene and Public Health By F Neufeld, and others Octavo of 223 pages, illustrated Baltimore, The Williams & Wilkins Company, 1928 Cloth, \$500

The 1926-1927 volume of the De Lamar Lectures consists of a variety of papers on immunity, heart disease, parasitology, tularaemia, measles, scarlet fever, and other subjects of interest to the public health specialists. The authors of the lectures are prominent in their respective fields and present the latest views on the subjects.

MAX LEDERER

THE NEWER KNOWLEDGE OF BACTERIOLOGY AND IMMUNology By Eighty-two Contributors, Edited by Edwin O Jordan and I S Falk. Octavo of 1196 pages, illustrated Chicago, Illinois, The University of Chicago Press, 1928 Cloth, \$1000

In the Newer Knowledge of Bacteriology and Immunology, edited by Jordan and Falk, is found a timely contribution to medical literature. It is a compilation of brief theses on bacteriological subjects, with a view of presenting in brief and concise form, the most recent knowledge in this field. The contributing authors are outstanding figures in their respective fields. 83 articles comprise this volume, and among the authors are many distinguished contributors to science. One need only mention as examples such names as Kendall, Rosenau, Jordan, Noguchi, Bronfenbrenner Rosenow, Wells, Zinssen, Landsteiner, Ottenberg, Coca and Kolmer These names represent only a small fraction of equally distinguished workers, who all together, have presented to every physician a veritable mine of the most recent information in their individual fields.

M LEDERER

CONDITIONED REFLEXES An Investigation of the Physiological Activity of the Cerebral Cortex By I P PAVLOV, for Mem R S Translated and edited by G V ANREP M D Octavo of 430 pages London and New York, Oxford University Press, 1927 Cloth, \$900

Amongst the men of science, Pavlov has established an enviable reputation for his scientific achievements His works on conditioned reflexes have been quoted extensively in every medical publication. The book is based on a series of lectures given in 1924, on the researches on the activities of the cerebral hemispheres in the dog These researches were conducted by Dr Pavlov and his pupils over a period of twenty-five years. The book has been translated by a pupil and collaborator of Dr Pavlov who has already established for himself a commanding position in the medical world. While the book is highly technical, and would therefore appeal but to a limited number of scientific physicians, it carries with it a peculiar personal touch that leads one to feel as if he were hearing Pavlov lecture in person Such a treat is indeed but the privilege of a few. Hence the book is a real contribution to medical literature, and will be a living monument to one who has contributed so much to the field of physiology and especially neuro-physiology IRVING J SANDS

Gynfcology By Howard A Kelli, AB, MD, and collaborators Octavo of 1043 pages illustrated New York D Appleton and Company 1928 Cloth \$1200 Dr Kelly's first book on gynecology is so well known

Dr Kelly's first book on gynecology is so well known and appreciated that the author needs no further introduction. Not often does one man have an opportunity

to write two books on the same subject, at an interval of a generation, especially after such notable changes as the gynecological field has witnessed, and the author draws attention to the great difference in present day treatment from that of years ago

The book covers the field of gynecology thoroughly from the medical, surgical and pathological aspects Dr Kelly has written a large part of the book himself, but many of the chapters have been delegated to clinicians and authors of wide reputation

Noteworthy among these chapters is Emil Novak's contribution on menstruation and endocrinology, Rubm's work on tubal insufflation, George Gray Ward's excelently illustrated chapters on the operative treatment of cystocele, uterine prolapse and pelvic floor pathology, and Hunner's work on ureteral stricture

The entire list of collaborators is too long to mention in detail, but their chapters have added greatly to the value of the volume

The author is to be congratulated on publishing a book on gynecology which will be of so much value, not only to the specialist, but to the general practitioner

wss

METHODS AND PROBLEMS OF MEDICAL EDUCATION (Eighth Series) Quarto of 375 pages, illustrated New York, N Y, The Rockefeller Foundation, Division of Medical Education, 1927

The eighth series of Rockefeller Foundation brochures on medical education is, as usual, lavishly illustrated, and crowded with detailed information on the teaching clinics in the United States and abroad. Its increasing size and the dates of the articles submitted for publication would indicate a large amount of material still unpublished

Annals of the Pickett-Thomson Research Laboratory (Containing a Historical Survey of Researches on the Streptococci) Volume III Quarto of 316 pages Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$10.00

This volume is devoted to the study of the streptococcus group "in general and in particular," and is to be followed by another volume which will treat of the pathogenic streptococci only. The present volume contains an almost complete historical survey of the researches on the streptococci done up to the present time and presented in a very well organized fashion. It should become one of the most prized volumes of the bacteriological research worker. The conclusions of more than 1100 investigators are carefully reviewed and the complete references of each is given in an extensive bibliography.

Th authors' contributions to the study of this subject are of utmost importance. They demonstrate convincingly why the "mutation bogey need not be feared" with the employment of proper means of cultivation and use of standard media and standard technique. They present the data which leads to the conclusion that it is the great multiplicity of species and not mutation phenomena which have made it difficult to classify the streptococci in the past. The authors describe a method of anaerobic cultivation using testicular and infusion agar with 5% boiled human blood. This method, they state is an essential in isolating the various streptococci found in human material. The writers repeatedly emphasize the observation that practically all streptococci grow much more profusely anaerobically than aerobically. Another valuable addition to the methods employed by these investigators in the classification and identification of the

LOBAR PNEUMONIA. A Roentgenological Study [A Correlation of Roentgen-Ray Findings with Clinical and Pathological Manifestations] By L R SANTE, M D Octavo of 137 pages, illustrated. New York, Paul B Hoeber, Inc., 1928 Cloth, \$300

A short monograph dealing with the Roentgen aspects of lobar pneumonia in which the author describes the findings in various stages of this process by serial roentgenograms. The differential diagnosis of pulmonary and pleural conditions is also discussed

The work offers valuable information as to the use and limitation of the X-ray as a diagnostic agent in lobar pneumonia and its complications and is recommended to those interested in the clinical and roent-genological aspects of pulmonary pathology

R. A RENDICH

Tuberculous Intoxications Concealed and Masked Tuberculosis A Clinical Study By Joseph Hollos, M.D., Octavo of 132 pages Edinburgh, E. & S. Livingstone, 1928

This book is the elaboration of an earlier one by the author published in Budapest in 1909 and in France in 1910. It received at that time the endorsement of several prominent physicians and a preface by Antonin Poncet. The persisting faith of the author in the correctness of his views and confidence in his treatment of the disease impelled him to publish his book at this time in English.

His "conception is that in the majority of cases tuberculosis does not present itself in the customary manifest form but remains concealed and has the appearance of anemia, neurasthenia, thyrosis, hysteria, epilepsy, rheumatism, dysmenorrhoea, rachitis, etc" (p 5) "In the vast majority of cases, rheumatic arthritis is nothing but one of the masked forms of tuberculosis," (p 38.) " the greater part of menstrual disorders are of tuberculous origin," (p 72) " headache, chest-ache, cholecystitis, angina, pain in the kidney, are among the many symptoms or syndromes consequent to chronic tuberculous infection," (p 93)

The author presents reports of sixty patients whom he has treated or followed while he was in Europe and the results he gives are truly remarkable if not incredible.

The treatment consists in the use of immune blood prepared after the method of Spengler A few drops of the 1/10000 millionth dilution of one c.c. of the blood of an immunized rabbit given hypodermatically, or even rubbed into the skin of the forearm once a week for several times does all the work. Nothing could be simpler We are a very credulous people, but it will take a great deal more of scientific work than reported in this book before this conception and treatment will be accepted by medical workers T A. McG

MENTAL DISORDERS A Handbook for Students and Practitioners By Hubert J Norman, MB, Ch.B 12mo of 463 pages, illustrated. New York, William Wood and Company, 1928 Cloth, \$500

The book is a comparatively small volume, the subject matter of which is divided into two sections. Section One is devoted to the clinical aspects of psychiatry. In the introductory chapter is pointed out the difficulty of formulating an adequate definition of insanity. The author says "no matter how carefully we attempt to define insanity our definition will be open to criticism." In the category of disorders associated with constitutional instability are included mapy of the emotional abnormalities such as the depressions, excitements, stupors, some of the confusional and delirious-like states, schizoid reactions, borderline types and mental deficiency. These

are all described in some detail and with the help of appropriate pictures should serve to impress the student and aid him in gaining a fair knowledge of these conditions. Under the disorders associated with psychoneuroses are discussed hysteria, neurasthemia, psychasthemia and epileptic psychoses. Symptomatic or associated disorders are made to include alcoholic and drug addiction, psychoses associated with somatic disorders, those with organic disorders of the nervous sytem and the disorders encountered in the different epochs of life.

Section Two is devoted to general considerations and in the brief historical survey the author traces the irregular progress from age to age of the development of our knowledge with respect to the care and treatment of the insane. Several chapters are devoted to normal and abnormal psychology. This is presented interestingly, but it would seem of greater advantage, at least to the student, if this preceded the study of actual mental disorders, thus preparing him to better understand the psychotic reactions. One chapter is given to a fairly exhaustive discussion of pathology in different mental disorders and here the question might be raised-would it not be an advantage to consider pathology in closer relation with the study of clinical symptoms? The cerebral spinal fluid is studied at some length with special attention to the various reactions and their significance in relation to certain mental diseases, notably the luetic. Considerable space is given to general treatment and various types of reaction are referred to with the approved methods of handling them Attention is called to such complicating situations as suicidal tendencies and persistent refusal of food, with appropriate means of meeting each

Some references are made to various clinical examples in life and literature with interesting comparisons with our present day psychiatric types. In many instances the likeness is striking

A chapter on legal aspects shows that the regulations were framed to meet essentially the same needs as we encounter, particularly in New York State.

The book is quite interesting reading, the facts being presented in such a way as to make it an aid to the student as well as an easy reference manual for the practitioner

A. E. SOPER.

A MANUAL OF OTOLOGY By GORHAM BACON, A.B. M.D., and TRUMAN LAURENCE SAUNDERS, A.B., M.D. Eighth Edition, revised Octavo of 576 pages, illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, \$450

This, the eighth Edition of Bacon's Manual is to all intents and purposes a new as well as an up-to-date book. It has been thoroughly revised and its appearance dignified by a handsome dull-red cloth binding. No other method than by transferring a synopsis of its chapters to this notice so completely illustrates its marked advance over all previous editions. They comprise "Anatomy and Physiology of the Ear," "Methods of Examination of the Ear," "Diseases of the Auricle," "Diseases of the External Auditory Canal," "Diseases and Injuries of the Drumhead and Middle Ear," "Otitis Media," "Adenoid Growth, Enlarged Tohsils, Diseases of the Nasal Passages," "Otitus Media, Catarrhal Otitis Media," "Adenoid Growth, Enlarged Tohsils, Diseases of the Nasal Passages," "Otitus Media," "Otitis Media," or Chronic Catarrhal Otitis Media," "Otitis Media," or Chronic Suppurative Inflammation of the Middle Ear," "Granulations and Polypi—Caries and Necrosis of the Temporal Bone," "Diseases of the Mastod Process" "Intracramial Complications," "Diseases of the Sound-Perceiving Apparatus," "Deaf-Mutism" It has an appendix and an index at the end

WILLIAM C. BRAISLIN

CHILDBIRTH An Outline of Its Essential Features and the Art of Its Management By William Gforgf Lef, AB, MD Octavo of 300 pages Chicago, Illinois, The University of Chicago Press, 1928 Cloth, \$3.00

Dr Lee's book is unique Nothing like it has ever been written. It is as readable and instructive as the Story of Philosophy,—really the Story of Childbirth A tale,—not a text book. It is written for all,—beginner, mature student, the teacher and even the layman provided he has a good education. It is not written with the shears and a pile of conventionalized text books, for it is distinctly different.

The chapters on forceps and their technique are of tremendous interest Reasons for forceps curves and shapes are well developed, and various methods of application are brilliantly discussed. All who practice obstetrics as an art should read Dr Lee's excellent contribution to our literature C A G

Anthelmintics and Their Uses in Medical and VETERINARY PRACTICE. By R N CHOPRA, MA, MD, and Asa C Chandler, MSc, PhD Octavo of 291 pages Baltimore, The Williams and Wilkins Company, 1928 Cloth, \$500

The authors are to be congratulated in collecting such a vast amount of practical facts regarding the handling of Helminthological problems occurring both in man and animal

The information about anthelmintics from both the pharmacolgical and helminthological viewpoints is of tremendous importance to the physician, nurse, veterinarian, research worker, etc

The book is divided into three sections

Section I deals with general considerations of anthelminties and helminths together with a thorough classification and life history of all the parasites

Section II notates anthelminties acting on Parasites in the gut. Here the various preparations are discussed from the chemical standpoint revealing their actions on the various parasites and the hosts

Section III discusses the anthelmintics used against parasitic infections located outside of the alimentary tract, for example, in the liver, bile ducts, blood vessels, muscles, central nervous system and other viscera

The contents of the book is very interesting and easy MATTHEW BRUNNER. to read

THE ABDOMINAL SURGERY OF CHILDREN By L. E. BAR-RINGTON-WARD, Ch M, FRCS Octavo of 283 pages, illustrated London and New York, Oxford University Press, 1928 Cloth, \$450 (Oxford Medical Publications)

This book of acceptable and convenient size, with 283 pages, 3 color plates and 82 other illustrations, represents a successful attempt on the part of the author to stress the importance of those occasional differences which are found in the surgery of children,—in this instance, in the surgery of the abdomen, exclusively

The author has, to a great extent, drawn on his own wide experience as surgeon to the Hospital for Sick Children, London, but appends to his chapters a list of references for additional study, if desired. The chapters on Congenital Hypertrophic Pyloric Stenosis and Intussusception are especially readable and instructive It would seem to the reviewer that the author has not stressed sufficiently in his chapter on Appendicitis that the pathology in the acute condition is almost always actively progressive

Books, such as this one, represent the results of some unusual opportunity for study and investigation While somewhat narrowed in their scope, they have when well arranged and well written, a definite appeal in focalizing interest in some subject,—and such an appeal thoroughly justifies their publication and their possession

THE MECHANICS OF THE DIGESTIVE TRACT An Introduction to Gastroenterology By WALTER C. ALVAREZ. MD, Second Edition Octavo of 447 pages, with 100 illustrations New York, Paul B Hoeber, Inc., 1928. Cloth, \$7 50

This is really a new book The first edition, an epoch-making contribution to our knowledge of gas trointestinal physiology, was instrumental in getting the author an appointment to the Mayo Clinic as director of the laboratory of experimental medicine, and there he has been enabled to do further work which has confirmed his previous theories. There is also a very exhaustive review of all the available literature on the mechanics of the digestive tract. The author's gradient theory is further clarified and its application to clinical gastroenterology is particularly stressed. The physiology of the gall-bladder is gone into in detail, much of the most valuable material having been obtained from Mann's famous article in "Physiological Reviews" The author's delightful style makes the book so fascinating that it is difficult to stop reading it. As the author intimates in the title, the book is a real "introduction to gastroenterology" and the application of its theories to daily practice will make for a more scientific and less empirical treatment for gastrointestinal diseases

PHYSIOAL DIAGNOSIS BY W D ROSE MD Fifth Edition Octavo of 819 pages with 310 illustrations. St. Louis, The C. V. Mosby Company, 1927 Cloth, Edition \$10 00

A very complete work on physical diagnosis which should be of especial value to students. Most of the book deals with the anatomy and examination of the Broncho-pulmonary and the circulatory system with the physical findings in the more frequent diseases of these parts. The illustrations are profuse and well taken making the text more easily digestable and of more in Especial effort is noted in this terest to the reader edition in the treatment of the circulatory system with especial reference to incipient cardiac insufficiency-a subject worthy of emphasis

The subject of electrocardiography has been very amply discussed in a chapter by Dr Drew Luten of St. Treatment of the abdominal viscera is fairly complete and there are about eighty pages devoted to the head, neck and extremities

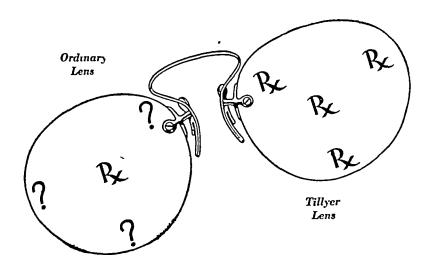

This edition is an improvement on a previous very valuable text book in diagnosis IRVING L. CABOT

THE COMMON DISEASES OF THE SKIN A Handbook for Students and Medical Practitioners By R. CRANSTON 12mo of 223 pages, with 68 illustrations Low MD New York, William Wood and Company, 1927 Cloth, \$6 00

This book presents the study of elementary derma tology in so simple and straight-forward a manner that the mere omission of confusing and complicating detail makes it a desirable addition to the library of medical student or general practitioner

The newer advances in therapy such as the intravenous use of gold in "Lupus Erythematosis," sodium thiosulphate intravenously in exfoliating diseases, and the wider use of electro-deessication in the new growths are entirely omitted, and the presentation of etiology and treatment is more or less empiric. However, the ample illustrations and strict adherence of the author to the discussion of the more usual phases of diseases of the skin serves to make this a more satisfactory handbook for the student, for what the book loses in completeness it gains, in that it supplies a concise yet sturdy foundation upon which it will be easier to build the understanding of the more difficult presentations of skin diseases when the student encounters them

OUR NEIGHBORS

MEDICAL CIVICS IN TEXAS

The July issue of the Texas State Journal of Medicine gives its first four pages to an editorial comment on the attitude of candidates for State officers toward medical legislation and public health. The Editors had written to the candidates offering them the opportunity of explaining their attitude on several medical matters. The introduction to the editorial says

"The purpose of this discussion is to urge that members of our association, at least, assume their political obligations with serious minds, and that they register at the polls one

hundred per cent

"If the medical profession does not take an interest in the political side of medical and public health problems, no one else can be expected to do so. That is, it is not likely that it will be done to any great degree of success. We would respectfully suggest that there are good-thinking citizens enough to settle almost every problem, and who are interested in almost any problem but that of medicine and the public health, which seems to put it up to the doctor rather strongly to care for the very important matter in which he is directly concerned, and directly obligated because of his knowledge of them."

Regarding a candidate for the U S Senate the Journal says

"His contention is that chiropractic and christian science, and other methods of the practice of medicine, should be regulated, licensed and controlled He sought, in one instance, we recall, to secure the passage of a bill regulating osteopathy, aside and apart from the plans that have been laid by the medical profession to have a single standard for all, as we have in Texas In the course of his discussion, he insisted that 'every person has the inherent right to choose for himself,' and that 'we are all different in our beliefs, but whatever we believe, we want all kinds of physicians and all kinds of healers who may prey upon the public to be properly regulated, licensed and controlled 'He further states that he thinks 'the chiropractors here ought to be regulated * * * so they cannot let shysters claiming to be chiropractors practice upon the helpless people when they are not qualified' He did know that the medical profession is opposed to special laws regulating special practices, for he is quoted as saying that 'unfortunately, all the allopaths, the old line doctors, are prejudiced against the osteopaths and the

chiropractors They are greatly prejudiced We cannot blame them, because they were brought up in that faith, and as long as they can, the allopaths are going to keep any kind of recognition from being granted either to the osteopaths or chiropractors"

Regarding another candidate for the U S

Senate the Journal says

"He opposed the bills to provide special regulations for the cults, and in every way that we have been able to find out, he has been orthodox in his views on medical and public health problems. He assures us that he will continue to be so. He comes of a family of physicians, and might be expected to be straight in these particulars. He has a brother and a brother-in-law practicing medicine in Texas now."

Regarding a woman candidate for office the

Journal says

"She is an unknown quantity from a medical and a public health standpoint. We have no reply to the letter addressed to her, and she has not been in a position where her attitude might be made known, according to any record available to us."

The Journal comments on the record of one

of the present U S Senators

"So far as we are able to determine, his record in the United States Senate has been in the clear in regard to medical legislation. We know that he rendered valuable services to the medical profession in support of its contention that doctors should be allowed to charge off expenses in attending medical meetings, as other similar groups are allowed to do, in rendering income tax returns."

Another candidate for office is described as follows

"He is orthodox in all medical and public There is no record to which health matters we may refer to check his statement, but we think there are few who would doubt his word He is informed, and speaks on any subject from a knowledge of conditions rather than from a desire to please the medical profession He unhesitatingly states that it is his view that people are practicing medicine when they undertake to treat other people for whatever is the matter with them, so matter what methods they use either to diagnose or cure, which is exactly the position we take For that reason he thinks that all who would undertake such important tasks should be basically in-

(Continued on page 1141, adv xiii)

(Continued from page 1138)

formed, and that being basically informed the matter of practice can be left to take care of itself"

A candidate for Governor is described as follows

"He believes in the fundamental principles embodied in the so-called one board medical practice act, and that the attitude of the medical profession as we outlined it in our letter to him, is correct from the standpoint of public policy. Some of the older members of the profession will remember a time when he was thought to be of contrary mind."

Concerning the present Governor the Jour-

nal says

"His attitude was distinctly favorable in advance of his election to his present term, and it would seem clear that it has been equally favorable since election He stands for an educated medical profession and for the control of public health through recognized scientific Indeed, it was largely through his instrumentality that the present Board of Health law was enacted, and surely no better selection of a board of health could be made than his When he was Attorney General he delivered an address in Fort Worth in denunciation of quackery and the illegal practice of medicine, which will be long remembered by those who heard it We know of no complaint concerning his public health services since he has been Governor"

A woman candidate for Governor is rated as follows

TOHOWS

"She served a term in the House of Representatives at Austin During that time she was rated as being against us She opposed our contentions in the matter of amendments to the medical practice act and in chiropractic and christian science legislation, both in committee and in the House We have not been informed as to whether she has experienced a change of mind in these important matters"

A candidate for Lieutenant Governor is

described as follows

"He was for several years a state senator During that time he was considered a friend to the medical profession and a supporter of its contentions for medical and public health legislation. No doubt he will be equally friendly if elected Lieutenant Governor."

The Journal praises the record of another

candidate as follows

"He helped to pass the one board medical practice act. He has been friendly to the contentions of the scientific medical profession during the several subsequent years of his service in the Legisalture"

Another candidate is quoted as follows "He states, however, that he is in favor of (Continued on page 1142—adv xrv)

More Convenient— More Economical— Greater Therapeutic Range

DISTINCTIVE features make the new Battle Creek Super Solar Arc Lamp noteworthy for its safety, efficiency, economy and broad therapeutic range. The automatic magnetic feeding of the carbons insures the largest arc possible with the given current. The current is perfectly utilized, and the use of 12-inch carbons minimizes loss of time and delay

Ease of adjustment to any desired position and the means of locking the lamp in place make this appliance most satisfactory for general use Power is variable in the Super Solar Arc. The rays may be concentrated to produce caustic effects, or toned down to reproduce mild sunlight. The combination of ultra-violet, infra-red and other light rays produces a spectrum that most nearly approaches that of natural sunlight.

Solar erythema can be produced with the Battle Creek Super Solar Arc in six to eight minutes, when desirable Occupying a minimum of space, due to its upright position, the lamp may be easily and quickly moved in adjustment to the patient

The new Super Solar Arc Lamp employs many advanced features in construction May we send you our new bulletin, completely describing this efficient appliance?

law This class will be very active and it certainly is not right that we should stand idly by and let those who fought the battles of public health legislation bear the burden of such attacks. It is true that this should be the burden and obligation of all citizens as well as the members of the medical profession, but it is equally true that other citizens do not know of the facts in the case and are not in a position to appreciate the situation. Therefore, our obligation in this regard is doubled.

"A little show of interest and a little educational activity in advance of election, will work wonders. Most candidates for the Legislature are honest, honorable men and desire to do the right thing, but it is equally true that a large proportion of them are not informed on such intricate problems as are involved in public health legislation, and we are all inclined to develop prejudice, particularly when we think it is a matter of the underdog. The cultist is a past master in the matter of posing as a martyr."

THE ILLINOIS MEDICAL JOURNAL

The annual report of the Editor of the *Illinois Medical Journal* covers three pages of the July issue, and contains the following paragraphs which are of special interest to New

York physicians

From the financial standpoint the Journal has enjoyed a year of unusual prosperity, in fact, the best in the history of the periodical. This fine showing is the result of earnest efforts of some forty individuals and agencies that handle advertising who patronize the columns of the Illinois Medical Journal. This splendid financial statement is doubly gratifying in spite of the policy of retrenchment in medical advertising as well as in every other line of business.

"Our field advertising solicitors and the numerous agencies that handle medical advertising accounts report an increasing number of firms that have discontinued the practice of advertising in medical journals, and in place of advertising have adopted the plan of appealing by letter directly to the physicians of the country, the claim being that this is not only cheaper but more effective. In spite of this and because of intensive solicitation we have been able to increase our annual income.

"Constant endeavor is made at all times to keep down the operating expenses necessary for the publication of an up-to-date journal Our printing firm has always given us a maximum service at minimum cost Frequently attempts through competitive bids have been (Continued on page 1144—adt x-n)

the strictest regulation of the medical profession 'not by laymen attempting to solve these problems, but through a competent board which would guard the reputation of the profession as zealously as they would the health of the people entrusted to their care' He says further, that it would be dangerous for the Legislature to go beyond the creation of such a board because 'it could not be expected to be learned in the medical profession—the most important profession in the world to all of the people'"

The present Lieutenant Governor is praised

as follows

"He has repeatedly and openly expressed his views on medical and public health matters, and they have invariably been in accord with those of the reputable, scientific medical profession. During his incumbency he has with out fail been an advocate, to the extent that his position would permit, of high educational standards for the practice of medicine and scientific control of the public health."

Another candidate says

"I have never believed that any one could properly treat an ailment of the human body who does not have sufficient knowledge and what that ailment might be I believe that if training to first diagnose and determine just the methods advocated by some of the cults and unlicensed practitioners in the state were as good as they claim them to be, out of the thousands of reputable physicians in the state some, at least, would be honest enough to admit their value and use them in their own practices" He states further, that if elected he will stand four-square in defense of scientific medicine

Concerning the candidates for the Court of

Criminal Appeals the Journal says

"We approach this subject with considerable trepidation, not desiring to be placed in the attitude of even indirectly criticizing a court or seeking to influence the views of an incumbent or prospective incumbent. However, we believe both of the candidates for this court are of the mental attitude calculated to deal successfully with medical and public health matters."

Regarding the candidates for the Legislature, the Journal says

"We cannot, of course, undertake a discussion of the attitude of the numerous candidates for the Senate or the House of Representatives of the State Legislature These matters must be handled locally

"It is a fact that by standing for scientific medicine a legislator incurs the ill will of the quacks and the cultists who would violate the

inade by printing firms to secure the business of the Society—Such attempts invariably have resulted in failure—To date no firm has offered a bid approaching the minimum cost at which we are at present operating

"The printer of an adjoining state journal who claimed to have reduced that journal's printing cost upwards of two hundred dollars per month interested us in a scheme of publishing several adjoining state journals in a co-operative arrangement whereby we claimed he could save a considerable sum of money for the Illinois Journal His estimate was finally submitted and was found to be upwards of three thousand dollars per year more than

we are now paying

"In other respects the cost has been similarly kept at a minimum Cost of office space, salaries, etc, is as low if not lower than in most state organizations Many state societies with membership equal to ours and others with memberhip only one-half that of Illinois main tain elaborate offices and a retinue of clerks, stenographers, etc. One state medical society pays \$4,500 per year as rental for the editors' In Illinois and advertising managers' offices the office rent is donated. Another state 50= ciety with a membership less than half that of Illinois maintains elaborate offices and pays in the way of salary to four persons (out of a retinue of employees) several thousand dollars per year more than the total cost in getting out the Illinois Medical Journal, including printing bills, postage, salaries, etc Another State society with a membership approvimately one-fourth that of Illinois pays its editor and a business manager a sum nearly equal to the cost of printing the Illinois Medical Journal

"In passing it must be said that the Illinois Medical Journal is not all science, propaganda and advertisements. The man who likes to keep in touch with his neighbor finds in every issue from six to a dozen pages of personals, good fellowship, small news items and other points of contact with physicians and the profession."

The minutes of the House of Delegates, published in the July Journal, contains discussions about the income of the Illinois Journal Dr Chapman is quoted as saying

"I think that the Illinois State Medical Society is operating both the secretarial and editorial services at what practically amounts to a charity basis. Both of these gentlemen draw salaries but not salaries entirely commensurate with the work, time and energy expended. The Council has considered economy and fairness in fixing these salaries. This is a Council

THE PREVALENCE OF SYPHILIS AND GONORRHEA

A Study in New York State

By ALBERT PFEIFFER, M.D., DIRECTOR—HERBERT W CUMMINGS, ASSISTANT DIRECTOR
Division of Social Hygiene, N. Y. State Dept. of Health, Albany

S TATISTICS for syphilis and gonorrhea in New York State have been collected and tabulated for the last ten years. New tabulated for the last ten years York City requires direct reporting of these diseases by the attending physicians, but in the rest of the State physicians are required to send appropriate specimens to approved laboratories for examination and if positive the laboratories are requested to send a report giving such information as is specified in the Sanitary Code, to the State Health Department. This indirect reporting in the case of syphilis has proven fairly satisfactory garding gonorrhea, there has been a strong feeling that the returns are so incomplete as to make it impossible to determine the trend of incidence As this trend is one of the most satisfactory checks on control activities, it is important to determine the number of cases at a given time for a base line, to be used as a standard for comparison in the future.

In a number of foreign countries, it has been the custom to make a one-day survey of cases of syphilis and gonorrhea under active treatment or observation at intervals of two to five years The surveys have been uniform enough to warrant deductions from the statistics About two years ago the New York State Department of Health decided to adopt this incidence study procedure and make a survey of the entire territory under its jurisdiction Upon the completion of the necessary groundwork the survey was launched as of May 2, 1927 The State exclusive of New York City presents an excellent field for a study for the prevalence of these diseases in communities of diverse size and character Its total population estimated as of July 1, 1927 was 5,495,387, the urban 1 section 3,436,467 while the rural 2 section numbered 2,100,518 Its 57 counties

range from wholly rural, eg, Hamilton, to predominatingly urban, eg, Erie with only 14 per cent rural population. Among the urban communities we have the large city of Buffalo with a population of almost 600,000 and 5 cities of over 100,000, an equal number of cities between 50,000 and 100,000, then there is a large number of urban communities varying from 5,000 to 50,000 and a group of villages from 2,500 to 5,000 numbering 86 New York State is peculiar compared with some other states in that the lines of travel from rural communities near the border of the State lead mostly to cities within the State It is not probable that many cases of syphilis or gonorrhea in New York State go to physicians in other states for treatment. There are a few cities in the southern tier of counties that draw cases from rural districts of Pennsylvania, but the number is very small. In the course of a year less than 50 cases of both syphilis and gonorrhea of persons residing outside the State have been reported as being treated by physicians within the State. In two counties, Westchester and Nassau, the statistics are not wholly representative of local conditions since many patients go for treatment to the neighboring cities of New York and Brooklyn

Овјест

The main object of the survey was to determine the number of cases of syphilis and gonorrhea under medical supervision at a particular time to obtain a base line for future incidence trend

Метнор

The survey was conducted mainly by mail A keyed questionnaire with three questions was sent to all physicians whether in private

(Continued from page 1144-adv xvi)

function and does not belong to the House of Delegates At the present time the Secretary's salary is \$2,400 and is not to be compared with the salaries of secretaries in other Michigan with half our membership has been paying \$15,000 to a general manager and secretary Texas has also been paying a high salary The Council has endeavored to be fair "

Dr Tuite said

"In connection with what Dr Chapman has said about salaries and the revenue from dues and advertising, I want to stress the advertising feature From a conversation which I had with the Editor at a recent meeting, it appears that he has great difficulty in selling his wares and he complains that our members do not patronize the advertisers, or if so, they do not make known their identity one city in the state in which when a salesman comes in to a doctor, he is asked if his firm

advertises in the Journal If not, they do not listen to him. If we had twelve such cities the Journal would be on a paying basis I call attention to this in our local society and Dr Sloan does the same"

Dr Ochsner said

"I have felt that the Illinois State Medical Society is operating more or less on a charity basis I have been a conscientious opponent of undeserved charity I have felt for a good many years that we have not paid the Editor of the Journal one-fourth the salary that he should have I would recommend to the Council of the Illinois State Medical Society if they can find the money anywhere to make good this neglect If you were to buy the services of a non-medical man to render service to the State Medical Society, you would pay him \$10,000 or \$15,000 a year and you would not get half the service you have had for a good many years from Dr C J Whalen"

The "Motion Picture Course in Proctology" offers a unique opportunity for INTENSIVE POST GRADUATE STUDY OF RECTAL DISEASES, For particulars write: J. F. MONTAGUE, M.D., F.A.C.S., 30 East 40th St., New York, N. Y.

KNICKERBOCKER ADJUSTMENT SERVICE CO.

Incorporated under the laws of the State of New York 152 West 42nd Street, New York City

> A FINANCIALLY RESPONSIBLE INSTITUTION

Bonded by the Fidelity and Deposit Company of Maryland

- (3) Facilities for treatment of indigent patients, in the cities—clinics—in rural communities—co-operating physicians
- (4) General education of lay people
 - (a) To avoid exposure
 - (b) To seek treatment early if exposed or infected
- (5) Number of promiscuous infected persons permitted to reside in the community
- (6) Number of persons relying on selftreatment or drugstore proprietary remedies or not treating at all

RESULTS (See Table I)

In Table I, 45 per cent of the registered physicians are shown as having one or more cases. Since many physicians in rural districts do not have more than a single case in a year, many of these might not have a case under supervision on this census day, hence the total number treating is probably more than 45 per cent. It should also be noted that there are many physicians who are retired and only practice in emergency, another group devoling their entire time to public health. Each of the four hundred odd institutions and hospitals was represented by only one report, the medical personnel was not included indi-

vidually If due weight is given to these factors, the estimated proportion of physicians in practise who are treating either syphilis or gonorrhea will rise to about two-thirds

Thirty-nine per cent of the syphilis cases were under treatment at clinics, hospitals and state institutions whereas only eleven per cent of gonorrhea was being so treated Nearly all of the cases of syphilis under the head of hospitals and state institutions were in the state The fact that about one-sixth of institutions the syphilis cases under medical treatment are supported wholly at public expense in state institutions and another proportion even larger, more than one-fifth are dependent upon free clinics for treatment, indicates that the control of syphilis has an important economic aspect to the tax-payer The cost to the State for the care of its indigent syphilities in institutions is about three-quarters of a million while their loss in earnings is estimated at four and one-half millions annually 3 Gonorrhea treatment is less expensive and usually does not incapacitate the person so the cost to the community is much less About ninetenths of the cases of gonorrhea and six-tenths of syphilis are treated in private practise

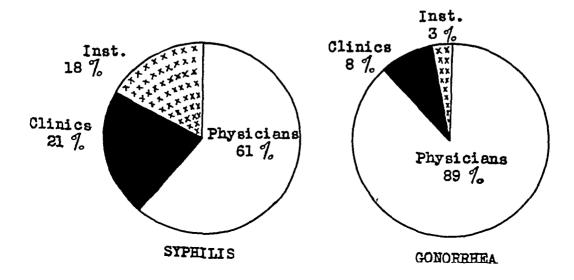

It will be noted that the total cases of syphilis exceed the total cases of gonorrhea,

TABLE II

Cases of Syphilis and Gonorrhea According to Sources of Information

		NUMBER-		PER CENT-

The information was to be grouped according to sex and stage of the disease

The questionnaire also invited each physician to give his opinion regarding the incidence

trend of syphilis and gonorrhea and his reasons for such changes as he had observed. Those failing to reply were given a second opportunity, and in several counties a nurse interviewed those not returning the questionnaire

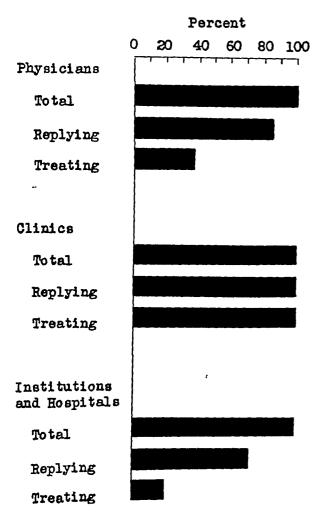

ACCURACY OF STATISTICS

In attempting to interpret any set of statistics, it is of prime importance to determine first of all, the degree of accuracy of the figures. In a body of information obtained by the questionnaire method, the main factor is the goodwill and complete co-operation of the

Sources of Information of Cases of Syphilis and Gonorrhea Under Treatment on May 2, 1927

SOURCES OF INFORMATION

informant It is, therefore, particularly gratifying to state that the Division of Social Hygiene was fortunate in meeting with the most cordial co-operation of the medical profession. The physicians who replied to the questionnaires represented 85 per cent of the total number registered and since a number were either retired or not treating these diseases the returned questionnaires represented even a larger percentage of physicians who treat such cases

We must next consider the accuracy of individual reports Since the questionnaires were confidential and the physicians were not asked to sign them, the information furnished by them did not contain any intentional deviation from the true facts. The chances of overstatements, if any, were likely balanced by similar understatements. Our figures, therefore probably, presented a true picture of conditions in the state on the date of the survey

FACTORS INFLUENCING THE REPORTED PREVAL-ENCE OF SYPHILIS AND GONORRHEA

The number of cases of syphilis and gonorrhea reported even in a one-day census depends upon several factors, and since one or more of these are very likely to vary even in cities and counties of the same state, they should be kept in mind

- (1) Proportion of physicians interested in
 - (a) Eliminating syphilis in all routine examinations
 - (b) Searching for hidden cases
 - (c) Discovering congenital cases
 - (d) Giving scientific treatment for syphilis and gonorrhea
- (2) Accessibility of laboratory facilities

- (3) Facilities for treatment of indigent patients, in the cities—clinics—in rural communities co-operating physicians
- (4) General education of lay people
 - (a) To avoid exposure
 - (b) To seek treatment early if exposed or infected
- (5) Number of promiscuous infected persons permitted to reside in the community
- (6) Number of persons relying on selftreatment or drugstore proprietary remedies or not treating at all

RESULTS (See Table I)

In Table I, 45 per cent of the registered physicians are shown as having one or more cases. Since many physicians in rural districts do not have more than a single case in a year, many of these might not have a case under supervision on this census day, hence the total number treating is probably more than 45 per cent. It should also be noted that there are many physicians who are retired and only practice in emergency, another group devoting their entire time to public health. Each of the four hundred odd institutions and hospitals was represented by only one report, the medical personnel was not included indi-

vidually If due weight is given to these factors, the estimated proportion of physicians in practise who are treating either syphilis or gonorrhea will rise to about two-thirds

Thirty-nine per cent of the syphilis cases were under treatment at clinics, hospitals and state institutions whereas only eleven per cent of gonorrhea was being so treated Nearly all of the cases of syphilis under the head of hospitals and state institutions were in the state The fact that about one-sixth of institutions the syphilis cases under medical treatment are supported wholly at public expense in state institutions and another proportion even larger, more than one-fifth are dependent upon free clinics for treatment, indicates that the control of syphilis has an important economic aspect to the tax-payer The cost to the State for the care of its indigent syphilities in institutions is about three-quarters of a million while their loss in earnings is estimated at four and one-half millions annually 3 Gonorrhea treatment is less expensive and usually does not incapacitate the person so the cost to the community is much less. About ninetenths of the cases of gonorrhea and six-tenths of syphilis are treated in private practise

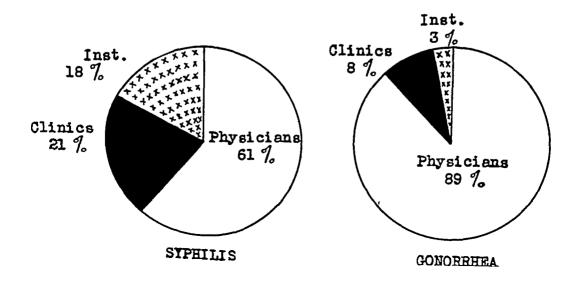

It will be noted that the total cases of syphilis exceed the total cases of gonorrhea,

TABLE II

CASES ACCORDING TO SOURCE OF REPORTING

although it is believed generally that gonorrhea is from two to five times as prevalent as syphilis. It should be noted, however, that this is a study of prevalence as determined by the cases reported on a definite date, and not an indication of the incidence, or new infections occurring during a year

The relative incidence of syphilis and gonorrhea would present quite a different picture than the relative prevalence for a single day Obviously if the treatment for gonorrhea rerhea, although in five of the communities in the group of fourteen the cases of gonorrhea exceeded the syphilis cases. In a similar survey in 22 counties in Kansas the cases of gonorrhea exceeded the cases of syphilis by 46 per cent. In upstate New York 35 of the 56 counties had more cases of gonorrhea than of syphilis. See table

The large number of syphilitic cases, 3,101 attending the clinics compared with gonorrhea cases, 887, is of course due to the high

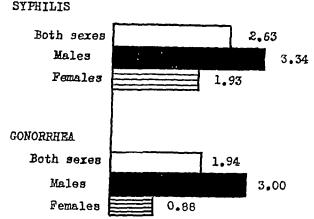

TABLE III

Cases and Rates Per 1,000 Population by Ser*

	CASES-			-RATES PER 1.000 POPULATION-			
	Both Sexes	MALES	FEMALES	BOTH SEXES	MALES	FEMALES

*Population estimated as of July 1, 1927

PREVALENCE RATES PER 1,000 POPULATION

quires only one-fourth the length of time as the treatment of syphilis does, which is a conservative estimate, the ratio of gonorrhea to syphilis in the prevalence study is only onefourth of the incidence ratio

Hence although syphilis cases exceeded the gonorrhea cases reported in the survey, gonorrhea is several times as common as syphilis

In the one-day census made in Detroit and the total for fourteen other communities,4 the cases of syphilis exceeded the cases of gonorcost of syphilis treatment while state institutions at all times have large numbers of neurosyphilities

Table III gives the rates for syphilis and gonorrhea according to sex. These are the rates for cases under treatment for a particular day and do not correspond with the incidence of new infections for a year.

Table IV shows that approximately threetenths of the cases are females and seventenths males. About one-third of the syphilis cases are females although in the clinics it rises to more than two-fifths. About 26 per cent of the females under treatment for syphilis were attending the clinics whereas less than 19 per cent of the syphilitic males were clinic cases.

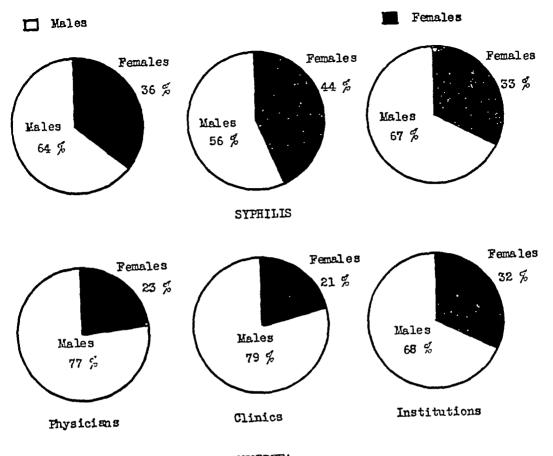

The females under treatment for gonorrhea constituted less than one-fourth of the total cases. It would seem logical for the ratio of male to female to be about the same for both diseases and such is the case in the state institutions and hospitals. If the statistics for state institutions and hospitals represents a truer cross-section of the relative prevalence of syphilis and gonorrhea according to sex than the statistics for clinics and physicians, it indicates that females are less likely to voluntarily seek treatment than males in the case of gonorrhea

The total cases according to source of reporting and counties are given in Table V

TABLE IV

CONORRHEA

It has been stated frequently by observers that the character of the population, whether urban or rural, affected the rates of syphilis and gonorrhea In Table VI there appears to be a decided tendency for the syphilis rates to decrease as the rural population increases. The correlation between the proportion of the rural population in each county and cases of syphilis on the day of the survey is

r equals—65±064

The coefficient of correlation is negative and is about thirteen times the probable error. In ordinary cases this would indicate a very strong negative correlation between the two However, it should be noted that these cases are credited to the counties according to the physicians reporting the case and not necessarily according to the residence of the infected person, hence the figures showing the prevalence of syphilis do not represent accurately local conditions. It is, of course, true that in many cases syphilis is contracted in some rural area while the patient comes for treatment to a clinic, hospital, or physician in a large village or city They do this both in order to receive competent treatment and also to avoid the necessity of calling on a local physician Notwithstanding this probability of error, the possibility of correlation between the proportion of rural population of each county and the cases of syphilis seems to be indicated by other statistics. The following table gives the rates per 100,000 for syphilis, by years according to the residence of the infected person.

Syphilis Rates per 100,000

		1923	1924	1925	1926	1927
Urban	٠	271	275	323	337	347
Rural		71	65	62	52	49

The rate is not only definitely higher for the urban than for the rural population, but the rate has constantly increased for the urban and decreased for the rural. In 1923 the syphilis rate for urban population was not quite 4 times that for the rural, whereas in 1927 the rate for urban population was 7 times that for the rural population. These statistics are based on the indirect reporting of 62,524 cases.

The correlation between the proportion of the rural poulation and the prevalence of gonorrhea is

			_		**** * ***********************	ad DEED 1	ሰለ ሰለበ

This, too, is a very definite negative correlation, but the statement made above regarding the coefficient of correlation for syphilis applies here as well

Here again by classifying 23,267 cases of gonorrhea reported in the usual way, according to the residence of the diseased person, the rates for the urban population are several times the rates for the rural population

GONORRHEA RATES PER 100,000

	1923	1924	1925	1926	1927
Urban	115	114	125	126	135
Rural	32	31	29	29	31

Infected persons may take up residence in cities or give city addresses when being treated in cities and thus make statistics incorrect even when based on recorded residence of the patient

If the prevalence of syphilis and gonorrhea does actually vary with the rural or urban population, it might well vary according to the density of population

The correlation between the density of population in each county and the prevalence of syphilis is

r equals $+ 238 \pm 084$

The correlation between the density and the prevalence of gonorrhea is

r equals $+ 125 \pm 088$

The last two coefficients show that there is

a slight positive correlation between the density of population and the prevalence of syphilis (the coefficient of correlation being about three times the probable error), while there is no analytical evidence of any relation between density and gonorrhea

A more exhaustive study should be made before any definite conclusions are drawn as to the relative prevalence of syphilis and gonorrhea in urban and rural districts or ac-

cording to density of population

SUMMARY

The New York State Department of Health has made this survey to determine the real prevalence of syphilis and gonorrhea on a given date as a basis to estimate the future incidence trend of these diseases. The physicians' willingness to cooperate with the Division of Social Hygiene was the essential factor in the success of the scheme

The total population of territory covered in this survey was almost 6,000,000. Observations based on populations of this size are but little subject to chance error and the conclusions based on them picture local conditions

accurately

The territory covered was large enough, and population sufficiently varied in density, occupation and racial stock, to represent reasonably accurately the conditions in the north-eastern part of the United States

The report covers 57 counties in a single state thereby reducing the effect from possible intercounty travel to the minimum

In five counties, Cattaraugus, Hamilton, Putnam, Tompkins and Warren, reports were secured from every physician. In 17 counties with a total of 1,291 registered physicians more than 97 per cent of the questionnaires were completed.

A number of counties representing widely varying conditions which have been thought to influence prevalence rates of syphilis and gonorrhea were studied thoroughly Nurses supplemented the questionnaires mailed

Data was obtained from 5,402 sources, divided as follows 93 per cent from physicians, 1 per cent from clinics and 6 per cent from

state hospitals and institutions

Nearly half (45 per cent) of the physicians reporting had one or more cases under treatment or observation on the day of the survey Of those treating, 80 per cent had cases of syphilis and 75 per cent had cases of gonorrhea

Among other results of this survey it has shown that most of the cases are treated by physicians. Although there are more than fifty clinics for indigents at strategic centers, 73 per cent of all cases of syphilis and gonorrhea were treated in private practice, 61 per

cent of syphilis cases and 89 per cent of the gonorrhea cases Monroe County had the highest proportion, 53 per cent, of syphilis cases treated at clinics and Cayuga county the highest proportion, 37 per cent, of gonorrhea cases, attending the clinics A very much higher proportion of the syphilis cases (21 per cent) than of gonorrhea cases (8 per cent) were treated in the clinics. On the day of the survey, the cases of syphilis and gonorrhea treated or under observation in private practise, clinics, hospitals and state institutions numbered 25,113, of these 14,476 were cases of syphilis and 10,637 were cases of gonorrhea This gave a prevalence rate of 457 per 1,000 population, 263 for syphilis and 194 for gonorrhea

The prevalence rates for males were about the same for syphilis (334) and gonorrhea (300) whereas for females the syphilis rate (193) was more than twice the gonorrhea rate (088)

Of the women who were under treatment for syphilis on the day of the survey, 44 per cent were attending clinics, more than double the corresponding proportion (21 per cent) under treatment for gonorrhea

The data available does not warrant definite conclusions regarding the prevalence of syphilis and gonorrhea according to the urban or rural character of the population or accord-

ing to the density of population

It has given a basis, imperfect perhaps, but of real value, for estimating the relative prevalence of syphilis and gonorrhea. The survey has given for the first time information upon which even a rough estimate of the incidence of gonorrhea could be based.

It has made possible the comparison of statistics of New York State with those of cities, counties and states which may make in the

future similar studies

It has proven strikingly that the general practitioner in New York State is treating syphilis and gonorrhea

It shows that the ten years of organized effort by the Federal Government and the State Division of Social Hygiene has probably resulted in getting thousands of infected persons under scientific treatment.

It has demonstrated that these diseases are sufficiently prevalent to constitute a major problem in preventive medicine

CAUSES OF DEATH AMONG JEWS IN NEW YORK STATE (EXCLUSIVE OF NEW YORK CITY), 1925

By J V DePORTE, Ph D

Director, Division of Vital Statistics New York State Department of Health

THE most remarkable element in the unique development of America is the voluntary acceptance by the various European racial stocks settled in this country of the attributes of a single nationality a common system of political institutions, devotion to the same historical traditions, ideals and aspirations. Here, the self-determination of groups has never been the subject of serious discussion and the concrete expression and the pursuit of separate racial interests has been envisaged in late years as an intriguing theoretical possibility by only one or two students of social relationships

The amalgamation of the diverse peoples has been, and to a large extent still is, a political and social, but not a biological process. The melting pot, while not wholly a theatrical phrase, has not yet begun to boil. The various racial strains of the population still run in fairly definite threads through our national web and we may follow their course and venture to foretell the effect of their presence

upon the completed design

The interest in the group elements of which our people is compounded has never been lacking, but unfortunately it has been wedded only too often to the transitory passions and prejudices of the day Here the biometrician should find fruitful application for his statistical in-

restigations

The upheaval of the World War has stopped for a time, possibly forever, free immigration into this country. Our foreign-born population will continue to increase from year to year by small increments of the racial groups of which it is now composed, but no influx of peoples, not appreciably represented here, is at all probable, at least not through the peaceful channels of immigration. We have, therefore, all the ingredients out of which the American type will be moulded in the course of the coming years. The extent to which each group will participate in the making of this type will be determined in a measure by the relative rate of its mortality.

The purpose of this paper is to present certain facts regarding the causes of death among one element of our population—the Jews Although unimportant numerically, they have made and are making an important contribution to our material, intellectual, and spiritual development. We shall not endeavor to decide the oft-discussed question whether the Jews are a people, nation, face, or merely a religious community. The weight of authoritative opinion at present is that they are, raci-

ally, comparatively pure Whether we use one or another of these terms the fact that the Jews are a distinct group is self-evident. In the words of Raymond Pearl, they "constitute a highly homogeneous group of people in the American commonwealth. It is for this reason and this alone, I take it, that every competent vital statistician agrees as to the great desirability of having statistical information about them"²

A RESUME OF SOME PREVIOUS STUDIES

At the outset, we shall summarize briefly the generally accepted characteristics of the Jews as a social and biological group. It has been noted almost everywhere that the rates of marriages, births, and deaths are lower among Jews than the corresponding rates of the non-Jewish population Jacobs ascribed these differences to social causes and in his opinion the advantages which the Jews enjoy "will persist as long as the virtues remain and will disappear when the bonds of religion and tradition are relaxed "2 This writer also shows that the ratio of male to female births is relatively high among Jews, that they have fewer stillbirths and illegitimate births than the general population

The prevalent opinion that the proportion of insane is larger among Jews than among people of other racial stock is, in the opinion of Brill, true only in respect to functional forms of insanity. The following quotation epitomizes this writer's judgment—"Although the Jew is not disproportionately predisposed to insanity in the strict sense, he is more nervous than the non-Jew Jewish sensitiveness is largely, if not wholly, the result of his past environment". It is undoubtedly true that even at present environmental factors exert a deleterious influence upon

the nervous system of the Jews

Biometrical studies of Jews in this country have been astonishingly few. In some instances statistics of natives of Russia were analyzed on the general assumption that most of them were Jews. This, of course, is not wholly satisfactory because in the absence of definite knowledge regarding the actual-proportion of non-Jews in that class of the foreign-born population, there is the theoretical possibility that this proportion might be sufficiently large to influence at least some of the deduction.

Several years ago deaths among the Jewish population in the city of Denver for a twenty-year period were tabulated according to cause. These figures, however, were presented without any interpretation of certain outstanding

facts as, for example, the tremendous proportion of deaths ascribed to tuberculosis. The high death rate from tuberculosis in Denver was, of course, due to the fact that that city has been for many years a mecca for sufferers from that disease and the excessive mortality from tuberculosis brought out in the tabulation could, therefore, in no sense be considered as typical of the Jews

The most satisfactory presentation of the vital statistics of the Jews in the United States is the report under that name by Dr John S Billings, which was published in 1890 as Census Bulletin No 19 It was the first and, so far as I know, the only time that a comprehensive study was made of births, deaths and marriages in a general group of the Jewish population in this country Since this report has been out of print for a number of years I shall permit myself to quote from it at some length

The preface explains that "This bulletin presents partial results of a special inquiry made under the direction of Dr John S. Billings, United States army, expert special agent, of some ten thousand Jewish families in this country, which for the first time in the history of the census permits a comparison of certain characteristics in the vital statistics of this people in the United States with those observed in Europe and with other people

The data used in compiling the tables given were obtained through the agency of Mr A S Solomons, who was appointed a special agent for the purpose, by means of separate schedules furnished the head of each family in any part of the United States whose address could be ascertained, without distinction of any kind except as to length of residence in this coun-The schedules furnished were, as a rule, from families who had been in this country five or more years on December 31, 1889 and represent the voluntary contribution of heads of the families No attempt was made to obtain a complete return of all Jews, but only to gather data from families embracing a sufficient number of persons to permit making the deductions valuable"

Returns were received from 10,618 Jewish families, including 60,630 persons—the data regarding births, deaths, and marriages being for the five year period 1885-1889

"The proportion of males to females was larger among the Jews than in the general population of the country at the Tenth Census, being 109 53 males to each 100 females, as against 103 57 males to 100 females in the general population"

"The proportion among them of children under five years of age is less than it is in the average white population in the proportion of 9 to 13, while from five to fifteen years of age it is greater in the proportion of 29 to 23

The proportion of those living between the ages of thirty-five and fifty-five is also somewhat above the average. This is due to effect

of previous immigration"

"The marriage rate is very low, only 74 per 1,000 annually, the average rate among the general population in the northeastern states being from 18 to 22 per 1,000. The average age at marriage is greater among the Jews than among the general population. The low marriage rate and increased average age at marriage are the main causes of the low birth rate."

"The figures for the births by successive years, if accurate, indicate that the birth rate is tending to diminish, especially when it is remembered that there was a somewhat smaller population to give rise to births in 1885, at the commencement of the period, than in 1889,

at the close"

"The total average birth rate for the whole population was 20 81 per 1,000, which is at least 10 per 1,000 lower than the average birth rate among the general population. A fairer means of comparison, however, is the ratio of births with reference to the number of women of childbearing ages present, viz, those between 15 and 49 years of age, inclusive. This rate was 72 87 per 1,000. The corresponding rates in 1880 in Massachusetts were 82 9, and in Rhode Island 86. The birth rate among Jews is, therefore, decidedly lower than it is among the average population."

"(The) average annual death rate (was) only 711 per 1,000, which would be little more than half of the annual death rate among other persons of the same social class and condition

of living in this country"

"Even if the number of deaths reported for the last year, 1889, are taken and increased by 10 per cent to provide for possible omissions, the gross annual death rate for that year would only be about 10 per 1,000, which is a low death rate"

Dr Billings constructed life tables based on the returns for the five year period. The expectation of life at birth proved to be 635 years for males and 596 for females as compared with 419 and 452 respectively in Humphrey's approximate English life tables, and 417 and 435 in the life tables for Massachusetts (1878-1882). Here the striking fact is not only the greater expectation of life among the Jews, but also that it was greater among males while in the other tables the females had a greater expectation of life.

An analysis of mortality according to cause showed "that the Jews have suffered a relatively greater loss than their neighbors by deaths from diphtheria, diarrhoeal diseases, diseases of the nervous system (and especially from diseases of the spinal cord), from dis-

eases of the circulatory system, urinary system, bones and joints, and of the skin, while their mortality has been relatively less from the tubercular diseases, including consumption, scrofula, tabes, and hydrocephalus, than the other peoples with whom they are compared"

"If the data as to births and deaths reported for the Jews in the United States were correct, they would indicate that the birth rate among them is decreasing and the death rate increasing with prolonged residence in this country"

"It is evident that the Jews in the United States preserve many of the peculiarities which have been noted among them in Europe, and that more extended and reliable data with regard to their birth and death rates in this country are highly desirable"

In another paper, Dr Billings stated that "in the old world the Jews have certainly shown remarkable staying powers in their struggle for existence, and to the physician, the physiologist and the sanitarian this is not specially surprising when their comparative temperance, their system of female hygiene and their occupations are considered. In this country some of these influences are different, especially among the males between 15-45 years, many of whom are probably more addicted to alcoholic and sexual excesses than their ancestors were They (the Jews) have shown that they can resist adversity, but whether they can also withstand the influences of wealth and freedom, and retain the modes of life which have heretofore given them length of day, remains to be seen "7

METHOD OF PRESENT STUDY

Our aim, expressed in an earlier paragraph, of securing information regarding the causes of death among Jews in the State of New York could not be carried out directly by the conventional method of analyzing death certificates because they do not specify the racial stock or religion of the decedent. We employed, therefore, the following procedure The health officers of all cities and villages in New York State, exclusive of New York City, having a population of 10,000 and over were requested to send us the names of cemeteries in which none but Jews were buried. The death certificates for 1925 were then edited according to the place of burial and those upon which a Jewish cemetery was shown were set aside the tabulations summarized in this paper were based on these definitely Jewish records the absence of any information regarding the populations represented by the mortality figures it was impossible to compute death rates In short, all that the present analysis enabled us to do was to determine the place of death, age sex, country of birth and cause of death in 1925 in the State, outside of New York City, of 557 persons, all of whom were Jews

MORTALITY ACCORDING TO PLACE OF DEATH

lhe tabulation of the 557 deaths according to place of occurrence shows that 442 were recorded in the urban part of the State, exclusive of New York City, 76 in rural New York and 79 in institutional districts, most of them, 69, in the state hospitals for insane. Before the reader draws the apparent and startling conclusion that 12 per cent of the Jews were insane at the time of death, we hasten to add that 65 of the institutional deaths (59 in the state hospitals) were of residents of New York City. For this reason we shall omit these 79 deaths from our discussion and confine ourselves to the 478 deaths which occurred outside of the institutional districts.

Almost one-half of the deaths in the rural territory, 35, occurred in Sullivan County, which harbors a number of sanatoria for tuberculous patients. The cities in which ten or more deaths were recorded follow

Buffalo	141
Albany	55
Syracuse	41
Mount Vernon	21
New Rochelle	13
Yonkers	13
Schenectady	10

COUNTRY OF BIRTH

The number and percentage distribution of decedents by country of birth are shown in the following table

S		DEA	THS
COUNTRY OF BIRTH		NUMBER	PER CENT
Total		478	100 0
Natave-born		173	36 2
Foreign-born		304	63 6
Russia	•	191	40 0
Poland		42	8 8
Germany		24	50
Austria		23	48
Hungary		8	17
England, Scotland, Wales		4	8
Canada		1	2
Other foreign countries		11	23
Country not stated		1	2

Thus, natives of Russia represented twofifths of the total followed by natives of this country, 36.2 per cent, and natives of Poland, 88 per cent

CAUSE AND AGE

the tollowing table summarizes the mortality according to important causes, by age

Of the deaths under one year 27, or 60 per cent occurred during the first month, most of them, 63 per cent, because of prematurity. The corresponding proportion for the entire population upstate equalled 56 and 43 per cent respectively.

Deaths Among Jews in New York State Exclusive of New York City, by Cause and Age 1925

CAUSE OF DEATH All causes Diseases of the heart Diseases of the respiratory system Cancer (all forms) Apoplexy, cerebral hemorrhage Tuberculosis (all forms) Acute and chronic nephritis Diseases of the digestive system Diabetes All other causes	ALL AGES 478 110 52 39 36 35 33 29 20 124	UNDER 1 YEAR 45 6	Under 5 Years 56 ————————————————————————————————————	5-14 YEARS 30 6 2 2 2 1 3	15-24 YEARS 32 9 1 1 - 8 1 1 1	25-44 YEARS 85 11 10 5 1 16 2 8 1	45-64 YEARS 161 47 11 19 19 9 14 3 15 24	*65 Years AND OVER 114 87 17 12 14 2 14 8 8 4 11

The distribution of mortality from all causes shows that the proportion of young children and of old persons was smaller among Jews than in the general population. This is in a measure, if not altogether, due to the fact that more than three-fifths of the Jewish decedents represented in our table were foreign-born, while the corresponding proportion for the entire population was only 23 4 per cent, the Jewish population containing, therefore, a relatively smaller number of persons at the two extremes of the life span

We shall point out briefly the outstanding differences in the proportions of deaths ascribed to various causes in the two groups of the population, always remembering that the percentages for the Jews are based on a small number of deaths

Discases of the Heart Proportion of deaths was higher among Jews In the age group 15-24 years the proportion ascribed to heart disease was three and one-half times greater than the

year, where the proportion was double that of the general population

Cancer, all forms Proportion of deaths was somewhat lower among Jews, mainly because of the relatively lower mortality in the age group 45-64 years

Apoplesy, cerebral hemorrhage Proportion of deaths was lower among Jews In the age group 45-64 years the proportion was somewhat higher than for the general population, but in the next group, 65 years and over, it was lower

Tuberculosis, all forms Proportion of deaths at all ages was higher among Jews In the younger age groups, however, particularly 15-24 and 25-44 years, it was considerably lower, while in the older ages the proportion of deaths ascribed to tuberculosis equalled that for the general population

Acute and chronic nepliritis Proportion of deaths was lower among Jews The disparity was particularly marked at 25-44 years, followed by 45-64 years

Vol. 28 No. 19 October 1, 1928

Diseases of the digestive system Proportion of deaths was lower among Tews This relation held generally in all age groups except under 5 years and 25-44 years, where the proportion was higher than for the general popula-

Diabetes Proportion of deaths among Jews was more than double that for the general population—among the Jews 42 per cent of all deaths were ascribed to diabetes as compared with 17 per cent for the general population interesting to note that in the age group 45-64 years deaths from diabetes among Jews represented almost one-tenth of the total (93 per cent) while in the general population the proportion equalled only 29 per cent, on the other hand, diseases of the digestive system were responsible for only 19 per cent of all deaths, less than one-third of the corresponding proportion in the same age group of the general population

Conclusion

It is very regrettable that this study had to be limited to the Upstate territory, where the Jewish population is only a fraction of that of the entire State If the records for the whole State had been available, we would have had the

facts regarding almost sixteen thousand deaths* instead of a bare five hundred. The main reason for presenting these very limited observations is to direct attention to the importance of quantitative study of the vital statistics, not only of Jews, but of other stocks in the population of The time to do it is this State and this country now while we have the necessary data or can secure them by a method such as was devised for this experiment

EARLY DIAGNOSIS AND EARLY RADICAL OPERATION IN TUBERCULOUS LYMPH GLANDS OF THE NECK*

By JOHN M HANFORD, MD, NEW YORK, N Y

TN 1902, in Edinburgh, the Roentgen ray treatment of tuberculous glands was first used In about the year 1903, Rollier at Leysin, Switzerland, started his work with the sunlight treatment of surgical tuberculosis At this time, tuberculous glands of the neck were treated largely by surgery In the surgical wards of the large city hospitals large numbers of these patients were seen It was not uncommon for the attending surgeon to assign them to the house surgeon for operation The operation was thought tedious yet not dangerous, so that many patients with advanced disease received indifferent operative treatment results obtained by surgery were often poor, with ugly scars and with reappearance of the disease in the neck

We can understand therefore the wane of surgery and the trend toward conservative forms of treatment during the past 20 years

The several factors in modern conservative treatment may be listed as follows

1 The removal of foci of pyogenic infections, as tonsils, adenoids and teeth

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 22 1928

- 2 Heliotherapy to the body surface
- 3 Cod Liver Oil
- 4 A high calory diet
- 5 Rest
- 6 Fresh air
- Tuberculin therapy
- 8 Local treatment

Roentgen-ray Local applications

counter irritants (iodine, etc.) Active and passive hyperemia Simple aspiration of "cold" abscess Local heliotherapy

Recognizing the value of almost every one of these factors, I am convinced that the deliberate avoidance of surgical removal in selected cases is a flagrant omission of which we physicians as a class are now-a-days guilty

There is only one, known, positive, certain means of stopping permanently the activity of tubercle bacilli in the human body and that is their actual removal Early radical removal is the most important part of the treatment of tuberculous cervical lymph glands

^{*}Dr William H Guilfoy Registrar of Records New York City Department of Health informs me that in 1925 burials in the twenty four Jewish cemeteries in Greater New York totalled 15 314

1 A great majority of patients with tuberculosis in the neck have their first manifestations in childhood This is a matter of common knowledge.

Analyzing the histories of 187 consecutive cases seen at the Presbyterian Hospital, New York, from 1917 to 1919, it was found that the majority first noticed disease in the neck before the age of 15

2 The disease in the neck at first is limited

usually to a single group of nodes

3 Despite all forms of conservative treatment, it is impossible to prevent spread of the disease into other groups or into adjacent tissues, (especially into the skin) in an uncertain number of patients These cannot be foretold

The majority of our patients in The Presbyterian Hospital special clinic during the past eleven years has been in the more advanced stages of the disease More than 400 patients have been admitted and studied. For example in an unselected consecutive group of 100 patients admitted to the clinic during the past 7 years 74% were beyond the early favorable stage and even many of those classed in the early stage showed skin involvement

In a recent study of 69 children aged 15 years and under, 62 4% were found in stages beyond the early favorable one Indeed only 5 patients were in an ideal stage for a clean suc-

cessful operation

Conservative treatment depends mainly upon increasing general resistance which is a slow process during the early part of which, especially, the disease in the neck often advances This partly explains the preponderance of advanced cases in our clinics and in surgical practice

4 Some of the popular present-day methods of treatment actually induce spread of the disease I refer particularly to local applications

Counter irritants, such as preparations of iodine and ichthyol, which I find used extensively, induce liquefaction of the disease and damage to the skin Thus the disease advances and the chance of a good cosmetic result is threatened

Heliotherapy directly to the neck is not of importance 'It may speed the healing of superficial sinuses, but any effect upon the deeper tissues is doubtful Furthermore it may act like a counter-irritant to induce liquefaction and skin changes It is decidedly contraindicated during Roentgen-ray treatment to the neck

Simple aspiration of "cold" abscesses, so popular on the continent of Europe, does not remove the bulk of the disease from which as a center other parts may become invaded abscess often refills and often forms a sinus at the site of puncture

I consider tuberculin therapy too hazardous

and too time-consuming for worthy considera-

5 A radical removal of the disease in its carly stage can effect a quick and permanent cure with a good cosmetic result in a very high percentage of cases, especially in children-in over 90%

Generally speaking, the more advanced the disease the more difficult it is to cure by any

In the absence of satisfactory published results of conservative forms of treatment, it may be stated that known surgical results in early cases are the best results. They are certainly extremely good

The most convincing of all known published results from any method of treating tuberculosis in the lymphatics of the neck have come from Doctor Charles N Dowd of New York In 19051 and again in 19162 he presented the

results of operative treatment

In his 1916 report, he divided the patients into three groups according to the extent of their disease in the neck Group I he called the early favorable type In Group I, the swelling is limited usually to the upper deep cervical nodes below the angle of the jaw beneath, or protruding from beneath the sternomastoid Group I might also be interpreted to include swelling limited to such a part as the submaxilliary or submental nodes

Dowd's 1916 report is based upon a study of 687 patients operated upon during the 20 years

preceding 1916

452 fell into Group I, in which the average age Thus they were a group was 803 years All of these except 98 mostly of children were followed and observed for periods ranging from a few months to 6 years Hence 354 were traced after operation 91% of these patients traced were apparently cured when last

Dowd remarks,—"It is hard to think of another form of surgical operation which gives

better results"

In Group II—there were 125 patients operated upon and followed and the corresponding results were only 682% apparently cured

In Group III—43 were operated upon and followed, with only 34% apparently cured

Dowd's most poignant conclusion is thisthat "a patient should not be allowed to drag from Stage I to Stage II while indefinite forms of treatment are being tried, nor should he be kept under treatment for months or even years

when a forty-minute operation and ten days after-treatment would result in cure"

Surgeons familiar with children's work generally accept these conclusions Frasers of Edinburgh and Semken' of New York in recent works emphasize the value of early radical operation

Semken, arguing for radical removal, writes, "The period of hospitalization is brief, the mortality is less than 1%, the post-operative discomfort is of brief duration and not severe, and the resultant scar is not conspicuous if the operation is done before extensive involvement has occurred, and the incision can be placed in natural crease lines"

Dowd, further states that "the fear of disfiguring scars leads many to postpone operation until the most favorable time has passed or even until tuberculosis has invaded other

organs"

There is less disfigurement from carefully planned incisions, especially early in the disease, than from ulceration without operation or from small incisions in several nodes, or from badly placed incisions, but nerves must be avoided

I would like to emphasize another asset of early radical removal It terminates the toxemia from the active tuberculosis in the neck All forms of non-operative treatment are slow, so that the patient is subjected by them to an indefinite period of toxemia, with some degree of damage possible to important viscera and with delayed attainment of vigorous health

From a recent study of the 69 children, under the age of 15 years, treated during the past six years in our special clinic for this disease at the Presbyterian Hospital, New York, certain observations have been made Some of the find-

ings are herewith submitted

I have subdivided Dowd's Group I into I(a) and I(b) because of the great difference in the ease of operation and of the results obtained in the more favorable early Group Ia In this there is but little central softening, no skin involvement, and limitation of the disease to a part, only, of one group of nodes The typical Group I(a), as usually seen, is limited to the nodes anterolateral to the upper part of the internal jugular vein, and excludes those posterfor to the vein

The treatment has by no means been confined to surgery Surgery has been usually the main stroke, as it were, to be followed by all available indicated means of general and local treatment, consisting of careful dressings, Roentgen-ray treatment, diet, rest, fresh air, cod liver oil, heliotherapy of some sort to the general body surface and the elimination of foci of secondary infection. The terms "apparent cure" and "marked improvement" are used in the following way By "apparent cure" is meant entire absence of any sign of disease in the neck and by "marked improvement" a neck almost cured, all healed, and with nothing but nodes of one quarter to one half centimeter in size which may be healed but possibly only quiescent. From the standpoint of prognosis there is a real difference between these two states, yet from that of the immediate condition, "marked improvement" means a satisfactory result.

The accompanying figures will indicate some of our observations from the 69 children

Of the 69 patients there were

5 in Group I (a) 21 in Group I (b) 17 in Group II 26 in Group III

Their ages ranged from 9 months to 15 years 56 were proven tuberculous

13 were definitely tuberculous clinically

Follow-up Period

Of the 69 patients

50 were followed for one year or more

11 were followed for more than 6 but less than 12 months 8 were followed for less than 6 months

The average follow-up period was about 21/2 years Many were followed 3, and some 6 years

Results

Group I (a) 5 patients, 100% apparently cured All received radical excision.

Group I (b) 21 patients

12 received radical excision and of these

11 became apparently cured—about 92% } 12 satisfactory 1 markedly improved

Of Group I (b) as a whole, receiving various kinds of treatment, 16 out of 21 became apparently cured—

Group II 17 patients, 9 received radical excision and

3 became apparently cured—about 33% } 7 satisfactory

4 became markedly improved 2 were failures as long as they were

followed

Of Group II as a whole, 8 out of 17 became apparently cured—about 50%
Group III 26 patients Only 3 received radical ex-

cision and of these

2 became apparently cured—about 66% } 3 satisfactory became markedly improved

Of Group III as a whole, 12 out of 26 became apparently cured-about 50%

Note the better results in Group I than in Groups II

For the Group of 69 patients as a whole 29 received radical operation, and of these

21 became apparently cured-about 72%

6 became markedly improved 2 were failures

Hence 27 of these were satisfactory Of the whole Group of 69 patients together 41 became apparently cured—about 60%

21 became markedly improved

62 were thus satisfactory-about 81% 7 were failures

There were no serious complications nor deaths These figures definitely point to the value of treatment in the limited stage of the disease and to the value of radical operation.

Even in the early stage of the disease (Group I) there are these contraindications to radical excision

Usually under one year of age

Active tuberculosis within the chest

Fever of 101° or more.

Respiratory or other acute infections

5 A poor constitution indicating lowered resistance of extreme grade. A recent radical operation upon tuberculous tissue

elsewhere within 2 months 7 A state of hypersensitiveness due to tuberculin

Fortunately these do not apply to most of our patients in this early stage

There is, therefore, evidence to show that more than 90% of children presenting the early stage of tuberculosis in the neck may be apparently cured of the disease by immediate radical excision combined and followed by judicious use of the other measures designed to increase local and general resistance

The technique of the operation in the early case is a definite one with successive steps, as in appendicectomy. Since most of the early cases involve the upper deep cervical nodes or the submaxillary nodes, the surgeon is especially concerned with the avoidance of damage to the accessory nerve and to the facial nerve to the lower lip, and with the avoidance of loss of blood from large veins

6 The success of surgical removal (aside from the technique) is dependent upon early diagnosis

The differential diagnosis of some of the common diseases with which tuberculosis in its early form in the cervical nodes may be confused is listed as follows:

Simple hyperplasia and simple chronic adenitis Sometimes low grade acute adenitis Hodgkin's disease Branchial cyst Lymphosarcoma Leukemia and pseudoleukemia Sebaceous cyst Lipoma

It is needless here to discuss each one separately Close attention to the essential factors of early diagnosis in tuberculosis as shown below is strongly urged

The Essential Factors in Early Diagnosis

- 1 Nodes enlarged to 1½ to 2 cm in diameter or more, or a mass of 2 cm or more persisting for more than 6 to 8 weeks, without evidence of acute inflammation or without much evidence of acute inflammation
- 2 Slight fluctuation
- 3 Slight but definite constitutional reaction, usually Anemia, lack of energy, failure to gain weight
- 4 Roentgen-ray evidence of calcification in the neck 5
- 5 Tuberculosis of tonsil if removed and studied in stained sections
- 6 A sterile culture of aspirated "pus" from
- a fluctuating part
 A biopsy—but it usually should consist in a radical complete excision, combining therapy

Syphilis rarely, if ever, causes local enlargement of nodes likely to be mistaken for tuberculous nodes. A positive Wassermann does not rule out tuberculosis

The blood count does not help except in the leukemias

The tuberculin skin tests, whether positive or negative are not to be relied upon in the presence of nodes suspected of tuberculosis

Variations in the local findings in the way of size, isolation of nodes, periadenitis, and consistency are of doubtful value in diagnosis. But the enlargement of a single group with mutual adhesions of the several nodes, in conjunction with the other factors in diagnosis is suggestive of tuberculosis.

Conclusions

- 1 There is reliable statistical evidence to show that radical excision of localized tuberculosis in the cervical lymphatics results in over 90% of apparently permanent cures, especially in children
- 2 A recent study of the records of 69 children confirms this evidence and indicates that in the most favorable types, early in the disease, an even higher percentage may become cured Especially is this true if foci of infection be eradicated and general resistance increased
- 3 The success of radical operation, aside from the technic, is dependent upon early diagnosis
- 4 An early diagnosis is usually possible by following a few simple rules which may include a therapeutic biopsy
- 5 Delay occurs during the stage of hopeful optimism and during the early part of conservative treatment. Iodine and other untants induce and hasten spread of the disease
- 6 As a rule, with the diagnosis made or with therapeutic biopsy determined upon, the operation should be made forthwith, because extensive liquefaction may appear within two or three days. Then the opportunity for a quick cure and for a good cosmetic result may be lost

FRACTURE TREATMENT TODAY*

By CHARLES L SCUDDER, MD, BOSTON, MASS

I SHOULD like to state certain truths with regard to fracture treatment which are generally recognized as characteristic of treatment

as practised today

Progress in the improvement of fracture treatment has been slow necessarily. Surgeons have been uninterested in this subject. The fact that pathological surgery has advanced so rapidly is because pathological surgical diseases killed. Fractures, on the other hand, have only crippled individuals. When it was recognized that fractures did kill, then Lister, taking Pasteur's work, reduced the mortality of compound fractures to an almost negligible figure.

That deformity and crippling result from fractures has attracted attention comparatively recently. Because crippling has interfered with the activity of men in industry, a greater interest has been shown in fracture problems than ever before, yet improvement in fracture treatment.

has been very slow

With the great increase in motorcycle and automobile accidents, the whole aspect of traumatic surgery has changed. There are more bizarre and unusual types of fractures than ever before. Fracture lines are more likely to enter joint surfaces. Multiple fractures are not uncommon. Frequently important organs are involved. Consequently, the treatment of fractures has become more difficult and it is becoming increasingly so.

Because of the increased difficulty of caring for fractures, we are all coming to recognize the fact that men specially trained for the purpose should take care of fractures of bone. It seems to me that men of a particular temperament and with qualifications which do not often exist in the present-day general surgeon should be trained for this special work. The industrial and traumatic surgeon is of a very different type from

that of the older more general surgeon

The general practitioner will always care for many fractures and certainly may and can care properly for many of the simple fractures. This will always be true. The important fact is that he should recognize the cases which are difficult for him to take care of. If the man in general practice, whether it be in surgery or medicine, who has a general knowledge only of traumatic lesions, would call in consultation at an early date someone understanding better than he the proper care of fractures, many of the terrible results which are now seen would be eliminated. An early consultation, within the first twenty-four hours of the injury, is imperative if fracture treatment is to improve. To delay a consultation for a week or ten days is harmful and may

be a cause of many complications arising so that the case which was simple at first becomes very complicated

It is possible for the general practitioner in all cases of injury to the extremities to give the initial treatment which the fracture requires in an appropriate and simple manner. No fracture of the upper extremity or of the lower extremity need be badly treated if every general practitioner understands the application of and properly applies the Thomas splint for the upper and lower extremities

All fractures should be regarded as emergency cases A case of appendicitis is treated at once Cases of extrauterine pregnancy, cases of perforated duodenal ulcer, cases of mesenteric thrombosis, are all regarded as emergencies and treated as such. I believe that every fracture should be treated instantly, both in private practice and in hospital practice. With the immediate proper treatment of a fracture, local swelling is almost always eliminated, shock is diminished, the fracture will be easier of reduction, time will be saved to the patient, as well as suffering Moreover, the early treatment will determine, if it is ineffective, the necessity for an operation

A fracture is damage to a very complex mechanism. The will of the individual patient is affected in every fracture. It is important to secure the co-operation of the individual who is injured in the care of the fracture and during

the prolonged convalescence

There is prevalent a new conception of bone, for which I think we are indebted mostly to Dr Neuhoff Bone is no longer an mert, dry, stable form of matter Bone is a living tissue, it has to do with the vital processes of the body Bone not only maintains the form of the body and serves as a means of locomotion, but it is a reservoir of calcium and is intimately related with the metabolic processes When bone is damaged the reaction to that damage is seen in the reparative processes which bring about union ing how delicate a tissue bone is, we understand why it is important to handle a fracture with gentleness, in other words, in the examination of a patient with fracture, it is important to avoid undue traumatization of the site of the fracture by rough manipulation During the progress of the healing of a fracture, it is unwise to make repeated examinations to determine whether union is present. The rough handling and the frequent manipulations tend to hinder the reparative process and may even be a factor in a delayed union

It is important that we know something of the results of our fracture treatment. Very few of us are able because of a careful study of end results of even small groups of our individual

^{*}Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y, May 23, 1928

Fortunately these do not apply to most of our patients in this early stage

There is, therefore, evidence to show that more than 90% of children presenting the early stage of tuberculosis in the neck may be apparently cured of the disease by immediate radical excision combined and followed by judicious use of the other measures designed to increase local and general resistance

The technique of the operation in the early case is a definite one with successive steps, as in appendicectomy. Since most of the early cases involve the upper deep cervical nodes or the submaxillary nodes, the surgeon is especially concerned with the avoidance of damage to the accessory nerve and to the facial nerve to the lower lip, and with the avoidance of loss of blood from large veins

6 The success of surgical removal (aside from the technique) is dependent upon early diagnosis

The differential diagnosis of some of the common diseases with which tuberculosis in its early form in the cervical nodes may be confused is listed as follows

Simple hyperplasia and simple chronic adenitis Sometimes low grade acute adenitis Hodgkin's disease Branchial cyst Lymphosarcoma Leukemia and pseudoleukemia Sebaceous cyst Lipoma

It is needless here to discuss each one separately Close attention to the essential factors of early diagnosis in tuberculosis as shown below is strongly urged

The Essential Factors in Early Diagnosis

- Nodes enlarged to 1½ to 2 cm in diameter or more, or a mass of 2 cm or more persisting for more than 6 to 8 weeks, without evidence of acute inflammation or without much evidence of acute inflammation
- 2 Slight fluctuation
- 3 Slight but definite constitutional reaction, usually Anemia, lack of energy, failure to gain weight
- 4 Roentgen-ray evidence of calcification in the neck 5
- 5 Tuberculosis of tonsil if removed and studied in stained sections
- 6 A sterile culture of aspirated "pus" from a fluctuating part
- 7 A biopsy—but it usually should consist in a radical complete excision, combining therapy

Syphilis rarely, if ever, causes local enlargement of nodes likely to be mistaken for tuberculous nodes. A positive Wassermann does not rule out tuberculosis

The blood count does not help except in the leukemias

The tuberculin skin tests, whether positive or negative are not to be relied upon in the presence of nodes suspected of tuberculosis

Variations in the local findings in the way of size, isolation of nodes, periadentis, and consistency are of doubtful value in diagnosis. But the enlargement of a single group with mutual adhesions of the several nodes, in conjunction with the other factors in diagnosis is suggestive of tuberculosis.

Conclusions

- I There is reliable statistical evidence to show that radical excision of localized tuberculosis in the cervical lymphatics results in over 90% of apparently permanent cures, especially in children
- 2 A recent study of the records of 69 children confirms this evidence and indicates that in the most favorable types, early in the disease, an even higher percentage may become cured Especially is this true if foci of infection be eradicated and general resistance increased

Vol. 28 No. 19 October 1 1928

ability must apply to the fractures of the patella as to any other contemplated operable case. There are certain stout individuals with a fracture of the patella with very little separation, in whom it is wise to secure by non-operative means only a fibrous union without operation. Ordinarily, if the operative risk is good, most fractures with separation should be operated upon. The degree of separation of the fragments is evidence of the extent of the tear in the lateral fascia on each side of the knee, consequently, if the separation of the fragments is considerable, one finger, two fingers, three fingers in width, it means that the lateral fascia is torn. I believe, under these circumstances, operation is imperative.

Dr Welles, Saranac Lake, N Y How soon do you allow active movement after operation upon a fracture of the patella?

Dr Scudder Within the first week

Dr Neuhoff, New York, N Y May I ask why one waits a week to start mobilization after operation for fracture of the patella? Why should one not be willing to start motion on the next day?

Dr Scudder I think that under careful supervision, particularly if the suture of the patella is

remforced by fascial graft, slight movement, supported and guided, may be begun the day after the operation, but in general, I believe that no harm can come from a few days' delay before initiating the primary movement. One may remember that the active contraction of the quadriceps muscle may be allowed without actually lifting the heel from the bed, and that this contraction of the quadriceps is helpful in maintaining its function

Dr Roemer, Utica, N Y How about the treatment of fracture of the os calcis?

Dr Scudder This fracture is followed by very great disability I believe heartily in the position taken by many of the men at the Massachusetts General Hospital Fracture Clinic, that whenever the fracture line thru the os calcis passes into the subastragalar joint, an immediate arthrodesis of that joint is indicated in fracture of the os calcis The reason for this arthrodesis lies in the fact that if it is not done, the disability following os calcis fracture is dependent upon an arthritis of this joint. The results in which this operative procedure has been followed have been eminently satisfactory The patients so treated returned to work at an early date after operation

INDEXING AND ABSTRACTING NEWS ITEMS OF MEDICAL SOCIETIES*

By FRANK OVERTON, M.D., PATCHOGUE, N. Y. Executive Editor, New York State Journal of Medicine

Physicians in Public Health —The practice of medicine has recently undergone extensive developments along the lines called public health, preventive medicine, and civic medicine These lines of practice have been developed largely by endowed organizations employing hired agents and executives, and using high powered salesmanship and propaganda Their practice has frequently been like that of church revivalists who preach moral health for a month or two and then leave the reformed sinners on the hands of the local churches, a burden to the pastors and deacons The responsibility of medical care of the slightly sick, as well as those seriously ill, falls ultimately on the family doctor Physicians are beginning to assert themselves in preventive medicine, and to cultivate the field that is now largely preoccupied by non-medical groups

There is an extensive literature on the practice of public health by departments of health and civic organizations, probably because the practice is spectacular and publicity regarding it is actively sought. In fact many phases of its practice are designed for their publicity effect

*Read before the Medical Library Association in the New York Academy of Medicine September 5 1928

Little publicity is given to the practice of public health by physicians, probably because such practice is expected, and because physicians avoid publicity. However, family physicians and their organizations are assuming the leadership in all forms of public health practice, and the literature on their public health activities is constantly increasing in amount and importance. The object of this paper is to point out the way by which medical journals and libraries may promote the record of the public health work done by the medical profession.

Public Health Practice by Organizations of Physicians—Physicians are now becoming aware of the civic duties which devolve upon them, and are making sincere efforts to meet their public obligations. The practice of public health consists largely in guarding against dangers which will strike only a few people,—no one knows whom, or which doctors will be called to attend the victims. Its practice is therefore carried on largely by organizations. The patients are the general public, and the physicians are the medical associations. Individual doctors are engaged in the broad field of public health practice by a eans of their county medical societies, and by

cases, to state what these results are. We do not know whether the kind of treatment that we are using is really the best treatment because we have never studied the final results

In the treatment of fractures we have a nonoperative method, based upon certain principles and employing a variety of methods, that is, traction, counter-traction and manipulation. We have also the operative method, based upon certain principles which underlie all operative procedures. By the operative method, we attempt, by direct re-position, to influence the fracture

There is no doubt that we are beginning to understand and recognize when skin traction is inadequate. I believe that this marks a distinct step ahead in the traction treatment of fractures of the shafts of the long bones. We see in a given type of fracture that it is impossible to reduce it by traction applied to the skin surfaces because the force necessary to pull the bones apart causes a slipping of the adhesive plaster and results in inadequate application of the force used. Therefore, recognizing, thru our study of the type of fracture, this fact of the inadequacy of skin traction, leads us at the outset to employ the alternative and more efficient skeletal traction.

I believe that we are able today, as a result of experience, to state that the operative treatment in a limited group of cases is the best initial treatment. This, too, marks a distinct step in the progress of fracture treatment. It is needless to say before this audience that the operative method must be used only by those who are skilled in its use and under proper indications.

There is no general fund of surgical knowledge regarding fractures which permeates the profession, such as exists in connection with pathological surgery A person has an attack of appendicitis Instantly the professional man in charge of that case reacts to what should be In connection with fractures, the situation is hazy and there are doubt and uncertainty as to the immediate steps to be taken I believe that with the improvement in fracture treatment, with an increased knowledge of the results of fracture treatment, there will come a time when there will be general information thruout the profession as to the wise thing to be done at the outset in every fracture case. When this time arrives, the ideal treatment will be the initial treatment and the initial treatment will become the ideal treatment which may be contained thruout the whole course of the case

The deeper one goes into any particular problem the more important that problem seems to be to the individual. I believe that today there is no problem in the whole of surgery more important than this subject of the treatment of fractures. There is a demand for a higher standard of result following a fracture than ever before The economic importance of a fracture is coming to be understood and recognized. We are judging of the results of fracture treatment by the restoration of the function of the part injured. These three facts are so new that the whole subject of traumatic surgery assumes an importance which a few years ago would have been unbelievable.

And finally, I believe that the recognition of the importance of securing good function is illustrated by the fact that in injuries near to joints, the prolonged immobilization has been done away with and we see an early active guided movement employed, securing for the patient greater joint movement, rather than the stiffness and disability which formerly resulted

I have thus stated briefly those truths regarding fracture treatment today which appear to characterize this treatment as an improvement over that employed a few years ago

Thank, you gentlemen, for this opportunity of addressing the Surgical Section of the New York State Medical Society

Discussion

Dr Larkin, Kingston, N Y I should like to ask Dr Scudder how he would treat a fracture of the surgical neck of the humerus

Dr Scudder There is no standard method of treating a fracture of the surgical neck of the humerus in an adult I believe that it may be possible, if the case is seen early and a fluoroscope is available, to bring the fragments into position and lock them. This is a desirable method of treatment. In cases that cannot be locked, bed treatment in external rotation and traction may be satisfactory. Occasionally, there are instances when an incision and manipulation under digital palpation will be needed to bring the bones into position. It must be remembered that we do not need complete anatomical apposition of the broken surfaces to secure a perfect function.

Dr Foster, Fulton, N Y I should like to ask Dr Scudder how he would treat a fracture of the olecranon entering the elbow joint

Dr Scudder If this is in an adult and there is separation of the fragments, I believe that in most instances an operative re-position with the employment of a non-absorbable suture is desirable. In elderly people, it may be possible to secure a fibrous union and moderately good function without an operation. At the Massachusetts General Hospital, Drs. Allen, Leland and Wilson are using a fascial suture and a fascial flap applied over the sutured fracture in these cases of olecarnon fracture with admirable results and an early return of motion.

Dr O'Mara, Kingston, N Y How does one determine when to operate on a fractured patella, and when not to operate?

Dr Scudder Of course the standards of oper-

worthy of inclusion among the scientific articles, but many other similar descriptions have been printed in the news department

Subjects to be Recorded —Medical movements of nation-wide importance have been evolved by the physicians of New York State during the past An example was the controversy year or two in Cattaraugus County between the medical profession and the promoters of the Milbank Demonstration, involving the broad question of leadership in public health,-whether it should be assumed by the medical profession, or be conducted by voluntary lay health organizations which practically ignored the physicians question was argued at several conferences of the representatives of the Medical Society of the State of New York and of the lay organizations The representatives finally agreed on eight general principles which were approved by the House of Delegates of the State Medical Society and later by the House of Delegates of Medical Society of New Jersey These principles were copied in a few state medical journals, but their value was not recognized as widely as their importance demanded

The state journals have discussed other topics of similar importance, among them are the following

- 1 County health departments 2 Anti-diphtheria campaigns
- 3 Lecture courses to popular audiences, as in

Illinois, Nebraska, and Michigan

- 4 Graduate courses for physicians
- 5 Medical legislation
- 6 County medical surveys

7 Public speaking courses, as in Queens County 8 The annual meetings of state societies, especially the reports of the officers describing the public health activities of the societies

THE NEW YORK STATE JOURNAL OF MEDICINE conducts a department called "Our Neighbors," abstracting and quoting what the journals of other states say regarding the public health activities of physicians in those states. Two or three years ago it was difficult to find a sufficient number of articles to supply the department, but now nearly every issue of every state journal contains something worthy of being quoted for the benefit of the societies of the counties and states

A Practical Suggestion—The state journals are the natural mediums for recording the activities of medical societies in public health and civic medicine. If they are to perform their proper functions, they must be improved along two lines.

- 1 More items
- 2 Fuller indexes

The Medical Library Association can promote the good work by adopting a memorial asking that the state medical societies take steps to improve these conditions

The following memorial was adopted by the Medical Library Association

WHEREAS the practice of public health and civic medicine by physicians and their medical societies has developed rapidly in recent years, and now constitutes a major activity of the medical societies of the counties and states, and the nation therefore be it

RESOLVED that the Medical Library Association suggest to the leaders of the several state medical societies that the state medical journals should (1), publish descriptions of the activities of the societies in greater number and fullness, and (2), should index the descriptions and news articles, so that the information may be readily available to the officers and members of the societies and other public health workers

the union of these societies in district, state, and national associations. The practice of public health and civic medicine has become one of the major functions of all of these societies, and is deserving of more attention by medical libraries and journals.

Doctors recognize the fact that the medical profession is only one of a group of a trinity of essential organizations of public health workers, the other two groups being (1), official departments of health, and (2), voluntary lay organizations Physicians realize their inability to practice public health without the authority, finances, and police power of a department of health They are keenly aware of the disasters which befall health officers who do not receive the support of their boards of health, both officially and financially Doctors have always been ready to supply the medical part of the public health work, but they were unable to work effectively until they devised the method of practicing public health by means of their medical societies. That method is now established and standardized so effectively that public health matters are discussed at practically every meeting of the medical societies of the counties, districts, states and the nation Nearly all the societies have active committees on public health and public relations which represent the individual physicians in the practice of public health and civic medicine

Field of State Medical Journals -Only a small amount of publicity has been given to the practice of public health and civic medicine by physicians Medical journals twenty years ago contained an occasional suggestion that doctors should take an interest in public health, but the record of its actual practice has rapidly increased during the last five years, until now every issue of every state journal of medicine contains items of the practice of public health by physicians varying in amount from a few paragraphs The special field of state medito whole pages cal journals is to record the activities of county and state societies in civic matters The problem is how to make the information available to physicians and other public health workers

The records of the public health work of physicians and their medical societies are not found in public health journals, or the reports of the departments of health, or the periodicals of lay health organizations. Any one reading these publications would get the impression that departments of health and voluntary organizations do the major part of the practice of public health to the exclusion of physicians from the field

The fact is that medical societies are entering the field of public health to an increasing extent, and their members are now assuming the leadership in all lines of the practice of civic medicine. The accomplishments of medical societies that have developed standards and models of public health practice will be unknown and unavailable to other societies unless physicians make their own records of their activities and print them in an available form. The journals of state medical societies are the natural sources in which one would look for descriptions of the activities of medical societies, and their news department has a value equal to that of the department of surgery and internal medicine,—as doctors and medical librarians are gradually discovering

The current record of the public health activities of physicians is history in the making. The importance of any single plan or activity may seem small at present, but if it is worthy, it may be adopted as the standard and model for similar Those who have read the work in the future reports of the officers of the Medical Society of the State of New York during the past twenty years have been struck with a five-year cycle of the recurrence of the same suggestions and plans Five years is a sufficient time to change the active personnel of the leaders of the society, and the new officers have had a habit of re-discovering forgotten ideals which died a-borning in the minds An available record of of their predecessors the activities and demonstrations of the officers and the committeemen of the State Medical Society would enable the new officers to start where their predecessors left off, instead of repeating their work and stopping with their meagre accomplishments

Abstracts of Articles on Public Health Activitics of Physicians -There has not been a great call for literature on the practice of public health by physicians and medical societies,—possibly be-It has been cause it has not been available scanty, and poorly indexed An indication of the lack of interest by readers of medical journals in the activities of medical societies is afforded by the absence of abstracts on public health topics and health movements in the larger medical journals, such as the Journal of the American Medical Association In fact journals and medical libraries abstract and index only those items which appear in the scientific department of the THE NEW YORK STATE JOURNAL OF MEDICINE has frequently printed descriptive news items in its scientific department in the expectation that it will be noticed by readers and will possibly be abstracted and indexed by other An example is that editors and by librarians a description of the activities of the four county medical societies on Long Island given at the meeting of the Second District Branch on November 9, 1927, was printed in the New York State JOURNAL OF MEDICINE of December first under the title "Organized Medicine on Long Island" The papers were descriptions of the performances of civic duties by the four county socie-ties on Long Island The descriptions were ties on Long Island

PUBLIC HEALTH PRACTICE A HALF CENTURY AGO

The practice of public health and civic medicine by family doctors is no new thing, but it has been advocated by the State Medical Society for half a century, as is shown by the "Transactions of the Medical Society of the State of New York from 1870 to 1890" (see page 1180 of this journal) Physicians have always been ready to support public health movements provided some organization other than medical conducts them Physicians supported the proposition of state examinations for the licensing of doctors and turned almost the entire machinery of executing the law over to the Regents Also, they turned the care of the insane over to the State Hospital Commission after the local doctors and officials had failed to give the insane proper care after long attempts

The question of the practice of public health and civic medicine could not be turned over to a central group of officials, but it required the daily efforts of both the practising physicians and the people The leaders of the State Medical Society a half a century ago attempted the sanitary education of physicians and the hygienic education of the people on a scale far larger than has been attempted since that time There was no sanitary science during the decade of the seventies, but an immense amount of investigation was carried on, and extensive sanitary surveys were made in many sections of the State The State leaders emphasized the duty of the local physicians to engage in the surveys and to take an active part in the suppression of the conditions which were found A committee on hygiene for every county medical society was repeatedly urged a half a century ago, and as a result many were formed and much excellent work was Nearly every volume of the Transactions of the Medical Society of the State of New York during the decades of the seventies and eighties contained reports of the activities of these committees But during all that time there was lacking the machinery for correcting or preventing the conditions State Board of Health was only a small organization, and both it and the local health boards dealt principally with fully developed diseases and epidemics, and the prevention of diseases was scarcely attempted, for there was no existing organization to which the work could be assigned as was the work of licensing physicians and the care of the insane

The slowness of the advance in sanitary practice was due largely to the attitude of the people. Physicians and the insane formed distinct groups of few individuals, while sanitary matters affected every person and their control required the expenditure of time and money by every citizen, and frequently the invasion

of his premises by the health officer and the curtailment of his liberty. Sanitary rules are popular—when they apply to the other fellow—but they are exceedingly unpopular to the individuals whom they subject to inconvenience. An immense amount of educational work extending over long years was necessary before the physicians of a half century ago could create public sentiment and intelligence sufficient to secure the adoption of the principles which they formulated

Great credit is due to the physicians who, of their own accord made extensive sanitary surveys and proposed methods for correcting the numerous defects which were found. It must be remembered that the physicians of the seventies were pioneers in public health work, and that they had no active departments of health or voluntary health organizations to It is remarkable that under support them those conditions they could accomplish what they did, and establish the art of the practice of public health and civic medicine on a firm The medical profession a half foundation century ago was the only group that was engaged in public health work, and the extent of the activities is apparent only to those who have investigated their record

The assertion of leadership in public health and civic medicine that is now advocated by the leaders in medical societies is only the resumption of the activities which were conducted exclusively by physicians a half century ago It was not suspected that any other group of citizens should take the lead in the practice of public health Physicians of the seventies and eighties diagnosed public health ills and prescribed the cures, but they could not force the remedies down the throats of an unwilling public The application of the civic remedies required the development of a group of citizens who should play the part of nurses This group was supplied by to the public voluntary health organizations who for twenty years have preoccupied the field of public health with the consent of physicians who had forgotten the leadership of their predecessors But at present there is a return to the former leadership in public health work by physicians in private practice

The arguments and pleas of the present Committee on Public Relations have their precedents in the reports of the Committee on Hygiene a half century ago. However, there is a difference Whereas fifty years ago there was no organized machinery for practicing public health, there are now Departments of Health and Voluntary Health Associations ready to supplement the work of the medical profession provided that physicians will resume the leadership which was unquestionable there a helf-area public health and the state of th

ably theirs a half century ago

DISTRICT BRANCH MEETINGS

The series of District Branch meetings, which began in Ogdensburg on September twenty-first, affords the opportunity for the officers of the Medical Society of the State of New York to observe the machinery of the local societies in action, and to form acquaintances which are the basis of an active morale Physicians attend the meetings for three pur-In the first place they desire to get inspiration and information from the scientific

leaders in the profession. In the second place they wish to hear about the administration of organized medicine, how county medical societies are conducted, and how they deal with the practice of public health and civic medi-They also earnestly desire the social relaxation and the recreation which comes from meeting their fellows All these aspirations are gratified in the District Branch meetings

MEDICAL PROGRESS

Post-Operative Massive Collapse - Statistical evidence adduced by Charles R Boland and Jessie E Sheret (Lancet, July 21, 1928, ccxv, 5473) shows that 137 per cent of all abdominal operations are followed by pulmonary complications, in males more often than in females, and after upper abdominal operations more than after lower ones Pneumonia occurring after abdominal operations is extremely rare and all of these complications consist of massive collapse of the lungs, which may or may not be accompanied by cardiac displacement Experimentally it is quite certain that the complete occlusion of a bronchus is always followed by collapse of the lung supplied by that bronchus, because the entrapped air is absorbed by the blood There is no lack of clinical evidence in support of this theory struction most often affects the larger tubes, but when the incision has been in the upper abdomen the deflation of the lower lobes is so great that the bronchioles may become primarily obstructed The predisposing causes are the catarrh which follows an anesthetic, the position in which the patients are nursed, and the inhibition of the cough reflex by pain or the excessive use of morphine. The treatment of massive collapse should be primarily prophylactic and should consist essentially of postural drainage of the bron-The authors have treated 47 unselected male patients by this method All pillows were removed and the foot of the bed was raised 20 inches above the head for 24 hours after operation None of these patients had massive collapse while this position was maintained Although this position is considered extremely unorthodox, nothing but good has followed its When postural treatment cannot employment be attempted morphine should be avoided as far as possible, as its excessive use certainly increases the liability of massive collapse. Attempts should be made to increase the aeration of the lungs by forced breathing or the administration of car-The authors bon dioxide to produce hyperpnea are, however, somewhat skeptical as to the value of the latter measure They also think that turning the patient rapidly on the unaffected side, as advocated by Sante, is somewhat violent, and does not always seem justifiable in the earliest stages, when it is most efficacious

Pyelitis.—Prof E Pflaumer of Erlangen is of the opinion that this diagnosis is becoming too frequent in practice, especially as a substitute for the "cystitis" of former days. The presence of pus in the urine, and even of turbidity, has sufficed for these diagnoses without fur-

The diagnosis of pyelitis is ther investigation apt to be suggested by fever and local pain but such symptoms may have a manifold origin The specialist with his ureteral catheterization cannot always be invoked The urinary finds may be due to a non-inflammatory condition of the ureters and kidney pelves, and while this condition may develop into a true pyelitis the latter word should not be used without due warrant author holds that the diagnosis "pyelitis" may be an error outright or incomplete. The large material of the Erlangen Urological Clinic shows that true pyelitis is very rare-30 cases in 2,500 patients, and later 9 cases in 1,200 patients! The author naturally refers to cases diagnosticated by all available modern resources. It is of interest to note that in cases thus certified the outcome is usually favorable Missed diagnosis is evidently due to centrifugalization showing the presence of a certain number of leucocytes per area which gives the illusion of pus in the urine. In collecting the urine the rule to examine only catheter specimens in females and two or three glass specimens in males is not observed. In males no pains are taken to exclude the possibility of prostatitis and spermatocystitis The temperature test is not trustworthy for the author sometimes finds it positive in cystitis, and patients with the latter may complain of pain in the kidney region, nor does the appearance of fever and backache in a known cystitis mean necessarily that the infection has reached the pelvis The author in his concluding remarks expresses his conviction that the snap diagnosis of pyelitis is absolutely worth-The finds on which the diagnosis is based may be due simply to malformations, kinking, or compression of the ureter, to lithiasis, etc-Munchener medizinische Wochenschrift, July 20, 1928

Urinary Retention Due to Hypertrophy of the Bladder Sphincter -Dr F Suter of Basle discusses only a single aspect of the much larger problem of contracture of the bladder neck which has been the subject of much effort by American As a rule Europeans have been slow to recognize this condition and even dispute its existence in some cases, or at least assert that they find no such unit disease in the clinic, but only certain scattered lesions such as hypertrophy of the prostate with deformity of the bladder neck, paralytic conditions from spinal disease, and so on Marion with his vast urological experience professes ignorance of contracture of the bladder neck, and one is forced to conclude that the latter is rare in Europe or else is masked under

PROBLEMS OF COUNTY MEDICAL SOCIETIES

The after-dinner meeting of the Fourth District Branch was a demonstration of what subjects are uppermost in the minds of the leaders of the State Medical Society. Five leaders had been invited to speak on the work of the State Medical Society, and each chose the relation of physicians to the practice of public health and civic medicine. There was little of theory expressed, but much of concrete suggestion regarding the duty of every doctor to support the public health work of his county medical society.

There was a note of warning that the field of preventive medicine was already occupied by organizations of laymen who are amateurs in the practice of medicine. These groups had been formed for the expressed purpose of developing efficient methods of practicing public health and civic medicine. Physicians generally feel that the methods of the lay organizations need to be improved, and that the medical leaders have demonstrated ways and methods of making the improvements, while retaining all the essential features of the work of the lay organizations. The method is extremely simple,—that every county medical so-

ciety shall survey the needs of its own county and proceed to form the machinery for meeting these needs

There is a gratifying amount of response to the suggestions of the leaders of the State So ciety. The present need is that each society shall decide to enter the field of the practice of public health, and then to discover the lead ers who will carry on the work with the approval and support of all the rest

The speakers at the District Branch meeting did not make public mention of what would probably happen if the doctors neglect to assume the leadership in the practice of public health. They might have said that the results of their neglect to satisfy the popular demand for health protection would be the adoption of free clinics to supply medical advice along curative as well as preventive lines of practice. But physicians will not wait for the threat,—they have already diagnosed the need and will surely apply the remedy

LOOKING BACKWARD

This Journal Twenty-Five Years Ago

New Activities of the Health Department Departments of Health everywhere have assumed the work of the detection of contagious diseases in school children, the establishment of baby clinics, and other similar activities to such an extent that physicians find it difficult to visualize conditions in times when none of this work was done. This Journal for October, 1903, quotes the following article from the New York Times of September 11, describing the advanced work instituted by Dr Lederle, Commissioner of Health—Editor's note

"A deep impression has been made upon people of the East Side by the activities of the Health Department Dr Lederle has been diligent in excluding from the school, children afflicted with contagious diseases, but he has established a corps of trained nurses, who,

when a child is excluded, go at once to the home and tell the parents how to treat the disease. These nurses go back to these homes every few days, and as a result, the children return to school usually in a very short time. In the summer these nurses give free treatment to the sick infants of the tenements.

"Dr Lederle has established a branch of the Health Department on the lower East Side, where poor people can get immediate treatment. He organized a summer corps of physicians to give special service to children suffering from peculiar summer complaints. He established a trachoma hospital, and last year 50,000 children received free treatment there for this disease, and without which many of them were sure to go blind"

Ignorance of technique is responsible for a certain percentage of failures The testing may be mefficient or the materials may be defective. Delayed reactions constitute another source of error, reactions may occur after four to six hours or after twenty-four hours In one of Vaughan's series the diagnosis was made on the delayed reaction alone in 179 percent of the For the detection of a delayed reaction the scratch should be three-eighths of an inch long, it is usually made on the back. Borderline reactions are worthy of consideration percent of a series of cases showing borderline reactions satisfactory relief was obtained from protein avoidance Adrenalin or ephedrine administration shortly before the performance of sensitization tests will give false negative skin The most important potential cause for therapeutic failure is ignorance of the patient. A large variety of non-specific factors may exert an influence on the allergic equilibrium. For example, of the author's allergics who were not benefited, 37 percent were constipated and 82 percent had focal infection. The condition of the nervous system, or mechanical irritation, such as a skin eruption, may influence the patient's aller- . gic susceptibility Among the insurmountable obstacles which may be responsible for failure are pulmonary emphysema, advanced bronchiectasis and some cases of sinusitis, but good judgment and increasing knowledge will eventually reduce the number of insurmountable obstacles The allergist should remember that he is treating not a disease, but a patient with a disease.—Laboratory and Clinical Medicine, July, 1928, xiu, 10

Hallux Rigidus - Prof. C Mau of the University Surgical Clinic at Kiel calls attention to frequent references in recent literature to a peculiar rigidity of the great toe of a greater or less degree which is associated with a contracture of the digit in question in flexion, while at the same time there is a slight subluxation of the basal phalanx plantarwards It has been included among the manifestations of arthritis deformans, but the latter is rather a sequel of it and if it can be recognized in its earliest stage there is a prospect of curing it. It develops in early life at about the time of pes valgus contractus and is attended by great pain. It is partly occupational and seen in porters, waiters, messengers, etc., as well as in certain athletes such as jump-The pain is present alike in ers and runners walking and standing and is marked in ascending and descending mountains The pain throws the toot out of position in the effort to escape it so that the patient walks on the outside edge of the foot or at times on the inner edge to the rear The gait is injured and the subject tires readily The entire foot may become painful and even when the patient lies down, the pain extending up the leg If at this early period a physician is consulted he will probably find the great too apparently normal although flexion on the metatarsal may be somewhat impeded. In time the joint becomes immobilized with the contracture and subluxation mentioned above. The condition of the great toe is mostly unassociated with other orthopedic disturbances The roentgen throws no additional light on the subject. Thus far we know nothing definite of the pathogenesis We can only surmise that too great a strain has been thrown on a foot which is naturally weak and that one adolescent may develop this condition while another will develop pes valgus principle of treatment involved in the early period is forcible reduction under narcosis and retention in a plaster of Paris support. Later stages require special operative procedures -Münchener medizinische Wochenschrift, July 13,

The Little Finger Phenomenon.—H Hoft and P Schilder of Vienna, in their studies of locomotor ataxia and lesions of the cerebellum. noted repeatedly that when the hands were stretched forth with closed eyes the little fingers were spread out even when the patients were told to close the digits together Further study showed that the test was dependable for static It may lead to the correct diagnosis of cerebellar lessons and incidentally of multiple sclerosis in its early stages Goldstein has shown that the cerebellum exerts a restraining influence on attitude tendencies and with injury of the same the influence is withdrawn. It is however not certain that there is a natural tendency to abduct the small fingers which is checked by the normal cerebellum Experiments on normal subjects seem to show that our knowledge of such matters is very incomplete. As already mentioned, the phenomenon is seen in locomotor ataxia. The subject shades into that of pseudo-athetosis of the fingers In ataxia the lesions are of course, in the posterior spinal nerve roots, and a reflex mechanism is involved. We should pay more attention to the normal position of the fingers under various circumstances and the factors which preside over position and motion For the present a spontaneous abduction of the little fingers when the hands are outstretched must be interpreted as indicating probable organic nerve disease. The mechanism may involve disturbed sensibility, as in locomotor ataxia, or lesions of the cerebellum, or possibly other portions of the central nervous system, or it may mean purely functional affections -Deutsche medismische Wochenschrift, July 20, 1928

Surgical Problems in the Aged —William P Glennon expresses the conviction that many elderly persons suffering from hernia, gall-bladder disease, hemorrhoids, procidentia, varicose veins with ulcer, even infections and gangrene of

ordinary prostatic hypertrophy The present author claims that the condition originally described by Fuller in America was an hypertrophy of the sphincter and the only authorities cited by him are those who report cases under this title, as Cholzoff in Russia, Rubritius in Vienna, and Marion and Chevassu in France. This status is the more puzzling for the reason that the condition originally described as "prostatism without enlarged prostate" and "median bar hypertrophy" had its inception among the old French urologists The author describes his case at great length, but does not seem sure of his ground for he speaks in one connection of an hypertrophy or hypertoma of the sphincter. as if he were not entirely convinced that the condition was not one of simple spasm. The final diagnosis was based on a biopsy in the course of an operation for stone in the bladder which complicated the urinary retention, and it appeared that there was no evidence of adenoma or other neoplasm but only a redundancy of smooth muscle fibers It is regrettable that such cases cannot be reported under the general rubric of contracture of the bladder neck with simulation of prostatic hypertrophy The vast American material on record should give this condition its autonomy and the details in the individual case may be taken up secondarily -Schweizerische medizinische Wochenschrift, July 21, 1928

The Use of Glucose in the Treatment of Epidemic Encephalitis -Although Fagley of the Veterans' Bureau and others have used glucose injections in encephalitis and it was also used during the war in influenza cases, Leland B Alford (Southern Medical Journal, August, 1928, xx1, 8) states that so far as he has been able to ascertain, nothing has been published specifically about the use of glucose in encephalitis. He has employed these injections in 40 cases of encephalitis, of which 22 were relieved of practically all symptoms, 12 were relieved to a greater or less extent, and 6 were unimproved Where possible glucose was administered by vein in the ordinary manner, but when this was not possible it was given by mouth, and also, in most cases, while injections were being given, administration by mouth was pursued at the same time The usual method of administration by vein consisted in the use of 10 percent glucose solution in amounts ranging from 150 to 500 c c It was given daily and, if feasible, 15 injections were administered In oral administration 1 or 2 ounces were given three times a day, and continued indefinitely large proportion of the cases in this series were of the more acute and milder types and in these the results were best, they were least favorable in parkinsonian and other syndromes where actual destruction of tissue can be assumed to have taken place In discussing the rationale of the treatment, Alford points out that 10 percent solutions of glucose are not very hypertonic and 5 percent solutions not at all so, and administration by mouth should not have a hypertonic action. In the course of experimental work he found that carbohydrates possess a protective action on the liver and kidneys, in a similar way glucose may have a protective effect on the nervous system.

Precocious Puberty Without Teratoma. Prof L Borchardt of Konigsberg quotes recent mass figures which show that nearly 400 cases are on record of precocious puberty from all causes, of which only 71 occurred in males The ordinary causal factors are tumors in the gonads, adrenals, or pineal glands, the last named predominating in the male sex. The author reports a case in a girl in which the pineal gland was held responsible although no tumor was in evidence, but rather a condition of hypopinealism Associated symptoms of unknown nature pointed to the pineal region, while the absence of tumor was obvious from the negative finds The precise nature of the lesion, if one existed, is purely conjectural, but the case is of special interest because of the fact that in girls the pineal gland has seldom been known to be associated with precocious puberty Tumors of the pineal are associated with the same condition in boys in only a minority of cases But two of the 327 cases recorded in female children seem to have been associated with the pineal region, so that the author's case makes the third two cases mentioned the condition seems to have been a hypoplasia of the pineal body, due possibly, if one case at least, to syphilis It has never been proved conclusively that precocious puberty in boys is the necessary result of a primary lesion of the pineal gland, for not only 15 the association a minority one but in many cases the gland is involved, if at all, only secondarily, and it is much safer to speak of the pineal region than the pineal gland The author, however, inclines to the opinion that the weight of evidence now makes plausible the view that hypopinealism may be responsible for precocious puberty in both sexes and that various indifferent lesions of . the midbrain may evoke the condition through the intermediary of the pineal gland-Deutsche medizinische Wochenschrift, July 27, 1928

Some Causes of Failure in the Specific Treatment of Allergy—Warren T Vaughan discusses the reasons for failure in the specific treatment of allergy under four headings, namely, superficiality, ignorance, poor judgment, and insurmountable obstacles. The allergist must not be a superficial thinker, he must look upon all things in the immediate and remote environment of the patient as potential allergens. It may be taken as an axiom that there is a specific allergic cause for nearly every case of true allergy. Failure to find the allergen does not demonstrate its

LEGAL

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

THE PRACTICING PHYSICIAN IN COURT

The above was the title of an exceedingly interesting and valuable paper written by Dr L Howard Moss of Richmond Hill, New York, and read at the Society of Medical Jurisprudence at the New York Academy of Medicine on January ninth of this year. This paper together with the discussion of the paper by those who heard it, was reprinted in the New York State Journal of Medicine on August 15th of this year.

In a very readable way. Dr Moss presented the details of an actual experience as an expert witness in a damage case. His discussion of the difficulties and delay which led up to the trial of the action and of his experiences in the trial is well worth reading. His description of the efforts of the lawyer for the plaintiff in that case to have the small boy plaintiff testify in accordance with that which he, the lawyer, stated should be the tacts, is a gloomy but illuminating commentary upon the methods pursued by some members of The lawyer there told the small boy what to say, but the honesty of youth rebelled Then the boy's father took a hand saying "Now, Jimmy, you know that Mr Jones is a great lawyer, who is trying to help you" "Yes, sir," "And he came the reply, somewhat hesitantly knows a great deal more than either you or I," continued the father "Yes," said Jimmy "And," continued the father, "if he said you walked across the street, why in all probability that is right. Now, you're only a little boy and don't fully understand how important it is to say it just the way Mr Jones tells you to Now think carefully, and see if you can't say it exactly as Mr Jones wants you to "I'll try," said the boy, and at the trial he did

The occurrence thus narrated presents a plain picture of subornation of perjury What happened at that trial occurred before the recent "ambulance chasing" investigation. The salutary effect which that investigation has had upon lawyers whose conscience would not deter them from such efforts to obstruct justice, may reasonably be expected to prevent or at least to diminish similar occurrences in the future The revelations made before Mr Justice Wasservogel were shocking indeed, although the facts there rerealed were not new to those who have come in But for the fact close contact with the courts that the legal profession is entitled to the credit of having brought about this investigation and having seen it through, the recent revelations

would tend to throw discredit upon the whole bar

Dr Moss' paper is a fair, but scathing commentary upon the administration of justice Many but not all of the criticisms are well taken He suggests for instance, that the students of medicine "should have included in their education, some simple fundamental instruction on the rules of evidence, and the obligations and rights of an individual as a witness'. To my mind this is both a sound and feasible suggestion. We see no reason why some simple, intelligible course on this subject could not be given in every medical school.

Dr Moss further discusses the confidential relation subsisting between patient and physician and the lack of clear knowledge upon the part of many physicians of the rights and duties now arising. We have now in the course of preparation an editorial which will be exclusively confined to this subject and which will appear in a later issue, in which it is hoped we may be able to throw some light upon this rather complicated but very interesting and important subject.

Towards the close of his paper Dr Moss discussed "the treatment of citizens at the hands of the Court, and the attendants" and indulged in these observations both wise and fair agreed that the court is entitled to and should receive the fullest respect of all in attendance no matter in what capacity, and, as well, of the community in which it has jurisdiction, and that this respect should be observed in every relation of individuals to the Court To this end the Court is empowered with authority, that, within its own jurisdiction is nearly if not quite This very fact, however, carries with it a reciprocal obligation, namely, that the Court shall so conduct itself as to be entitled to the respect which it demands Subjecting those who unwittingly offend in some relatively minor and perhaps even questionable particular, to unnecessary public indignities, does not, in the speaker's opinion, constitute conduct that inspires respect even though it may constitute an exhibition of power that intimidates The delegation of power does not lessen but rather increases the obligation to maintain dignity of behavior as well as of If there be truth in the saying 'once a gentleman always a gentleman,' then it may well be expected that the Court shall not cease to

the extremities, may be saved or at least made comfortable by conservative operative procedures, if one uses judgment in the selection of patients, the anesthetic best suited for the individual, and appropriate preoperative and postoperative care In the preoperative care simplicity should be the rule. The patient should be allowed to carry on as nearly as possible his accustomed daily routine up to the hour of oper-There are more deaths in old people directly and indirectly due to the indiscriminate use of narcotics and the improper choice of anesthetics than from any other one cause at all possible the use of morphine should be The anesthetic of choice in elderly patients is undoubtedly novocaine infiltration, but this should not be employed in the presence or neighborhood of acute inflammation groups of major surgical procedures, which cannot be carried out painlessly under novocaine infiltration alone, may be attempted by the use of a combination of morphine-hyoscine-novo-In patients sixty years of age or older, Glennon has found spinal or subarachnoid anes-This method of thesia the most satisfactory anesthesia has a very definite field of usefulness. in operations below the umbilicus Its advantages are that no morphine is required, excessive vomiting is rarely encountered, and the patient may take fluids by mouth immediately on his return to bed No one should attempt the use of spinal anesthesia without due deliberation and a thorough knowledge of the drug employed, so as to be able to localize the anesthesia with acute infection, high fever, low blood pressure, and those who are very nervous are unsuitable for this form of anesthesia operating is highly important in elderly persons, an operation which consumes an hour or more is usually fatal. The postoperative care should be individualized, side-tracking all the irritating routine hospital regulations Opiates should be limited or excluded The patient should be allowed out of bed at the earliest opportunity Suggestion therapy is particularly helpful during convalescence—Journal of the Missouri Medical Association, August, 1928, xxv, 8

Diagnosis of Pregnancy by the Presence in the Urine of Anterior Hypophysis Hormone—S Ascheim and B Zondek begin an article on this subject, the first installment consisting of the technical part of the research as carried out by Zondek Studies were first carried out on the mouse and, incidentally, the urine of the pregnant animal or human serves as a physiological test. The technique is very complicated and cannot be reproduced in a brief abstract. The method worked out positively in man in all but one of 45 tests, the total number of urine investigations amounting to 511. The authors prefer, however, to make use of the term "pregnancy"

reaction" rather than "pregnancy diagnosis" Conclusions may be reduced to three. In pregnancy there is an excess produced of the secretion of the anterior lobe of the hypophysis which is parallel with that of the ovarian hormone and which finds its way into the urine throughout pregnancy Traces of ovarian hormone also ap spear in the urine but are not suitable for the diagnosis of pregnancy since they also appear at the climacteric and in certain amenorrheas method elaborated by the authors should prove of great value in the early diagnosis of gestation and this holds good for the dead as well as living In the second installment Ascheim draws various theoretical and practical conclusions from these studies of the urine, revolving about the probability and actual occurrence of this reaction in the absence of pregnancy positive in one case of male urine, in two cases of inflammatory affections of the genitals, in one case of ovarian tumor, etc, but such finds were rare exceptions and paradoxical in character, although they naturally militate against the trustworthiness of the test —Klimsche Wochenschrift, July 22 and 29, 1928

Aplastic Anemias —Dr A Sonnenfeld speaks of the great difficulty in classifying the No longer do we speak of primary and secondary forms, for now it is believed that all anemias are secondary We may speak of embryonal and post-embryonal on a histological basis, the former corresponding to the pernicious form, but we may find both forms in association Another division is into primary myelogenic and secondary myelogenic, of which the first comprises pernicious anemia, chlorosis, leucemia, etc On a basis of pathogeny there is a division into excessive hemolysis of blood and diminished regeneration Here as everywhere (aplasia) of the same else the main difficulty in classification is the great variety of atypical forms. It is impossible to correlate symptoms with pathological alterations If we study the aplastic forms in connection with symptom complexes we may find something like uniformity, but the causal factors will show the widest variation blood picture is of a stereotyped character, the same as we find in cancer, tumors of the bone marrow, after rontgen radiation, etc In true pernicious anemia we may or may not find this picture The author saw a case of aplastic anemia in a woman at the climacteric in which puncture of the tibia showed complete fatty transformation of the bone mar-To sum up, the author regards aplastic anemia in the narrow sense as identical with the aleucia hemorrhagica of certain authors, he would look upon it as a functional anomaly only which may be seen in cancer, the climacteric, osteosclerosis, and so on -Klimsche Wochenschrift, Aug 19, 1928

CLAIMED NEGLIGENCE IN ADMINISTERING INJECTIONS

A married woman about thirty-five years of age came to the doctor's office giving a history of mental disturbances, loss of appetite and inability to sleep. The doctor made a thorough examination of the plaintiff and also called in consultation a neurologist. A diagnosis was made of her mental condition as acute melancholia, and physically she was found to be suffering from malnutrition.

The doctor prescribed for her physical condition, among other things, injections of sodium cacodylate. On the 3rd day of November, 1923 the first injection was given to the patient. This injection was made in the deltoid region of her arm. The defendant first rubbed the spot of injection with a solution of ether and alcohol. He then took a new needle, sterilized it, inserted it into his syringe, drew in the liquid from the vial, and injected the substance into the deltoid region of the plaintiff's right arm. He then rubbed over the spot where the injection was made with a solution of ether and alcohol. The injection was made subcutaneously

Before the first injection the defendant cautioned the plaintiff that the area about the place where the injections were to be made might itch, and told her that she should not scratch it Further injections were given to the plaintiff on November 8th, 13th, 18th and 24th. The patient did not react in any abnormal manner to any of these injections, except the last one. On November 26th the defendant was requested to call at the plaintiff's home. He did so and found her in bed with a slight temperature, and the area where the last injection was made on the plaintiff's arm was red. It bore the appearance of having been scratched. The doctor ordered Burrough's solution to be applied to the area on the plaintiff's

arm and gave her a powder containing calomel and aspirin to be taken internally

The doctor saw the patient at her home on the 27th, 28th and 29th days of November temperature was normal but the doctor found an indurated area forming on the plaintiff's arm in the region of the last injection The patient refused to follow the defendant doctor's directions and told him that she did not care for his treatment and that he should not come again. On the 1st day of December however, the patient called at the doctor's office and asked him to look at her arm He did so and told her that the indurated area on her arm should be opened plaintiff refused to have this done. She again called at the doctor's office on the 2nd and 3rd days of December, and on each of these occasions the doctor repeated his warning that the internal area should be opened, but the patient refused to follow his advice and left his office. The doctor never saw her again.

The patient subsequently began an action charging that the doctor had injected medication into her arm with unsteriled instruments and that he continued to inject her with some medication after a swelling had formed on her arm. She claimed that by reason of the defendant's negligence she sustained an abscess on her left arm.

Repeated efforts were made by the plaintiff to obtain a settlement but her attorney was informed that the case was wholly without merit and that no settlement would be made. The case came on to be tried but the plaintiff did not offer any competent proof of the charges that she made against the defendant doctor, and at the close of the plaintiff's case the trial court dismissed the action thus terminating it in the doctor's favor

FRACTURE OF SHOULDER—FAILURE OF COOPERATION BY PATIENT

This case illustrates the dangers of a lawsuit which are always present when a physician is called upon to deal with a patient who is either too ignorant or too stubborn to follow his direction, but who nevertheless, has no hesitancy in bringing an action against the physician charging him with negligence

The doctor was called to see an old lady whom he had known for twenty years Upon arriving at her home he was given a history that the plaintiff had fallen down a flight of stairs. She complained of pain in the right shoulder and gave evidence of severe shock. The doctor prescribed stimulants but the patient refused to permit him to make any examination of her injury. The doctor told the patient that she should go to a hospital and have an x-ray taken, but this she refused to do, claiming that she was too old, and

further that it was not necessary anyway. The doctor thereupon left her home and on several occasions thereafter when he saw the woman advised her to have an x-ray taken and to go to the hospital, but she persisted in her refusal either to have an x-ray taken, or to have any treatment rendered to her shoulder

The patient and her husband thereafter sued the doctor claiming that he was unskillful and negligent in failing to set the arm and shoulder of the plaintiff, and that he carelessly and negligently failed to give instructions to the plaintiff with respect to the use of her arm. After the commencement of the action an investigation of the facts by the plaintiff's attorneys convinced them that the case was without merit, and they voluntarily discontinued

1176 LEGAL

be a gentleman in, the expectation that thereby it shall create respect "

We have no masters in this country except the The judges as well as the court attendants, are the servants and not the masters of the people whose taxes provide their salaries witness owes respect and courtesy to the court, but this obligation is not onesided Equal courtesy and respect are due the witness from the lawyers, the judges and the court attendants. provided the witness properly conducts himself and manifests that respect which all of us should entertain for the ministers of justice tious, brusk, discourteous or insulting judge should have no right to sit upon the bench He retards and obstructs rather than assists in the high calling to which he has been chosen,—the administration of justice A judge who wilfully, continuously and persistently is guilty of such conduct should be impeached and removed from office A judge should be learned, experienced but above almost everything else he should be a gentleman Fortunately, however, the writer can testify of his own experience, running over a period of nearly twenty years at the bar, that he has encountered few indeed of the judiciary who might justly be criticized upon this score, yet he has seen it He will never forget his experience as a very young lawyer and as a junior counsel for the defense at the first trial of Peo v Lieutenant Becker when the conduct of the presiding judge was so arbitrary, unfair and unjust that the Court of Appeals was forced to hold that the defendant had been demed his fundamental constitutional rights in that he had not been given a fair trial The readers of English history will remember the notorious Fortunately, in this country we do not elevate the Jeffries to the bench Our experience likewise is that as a general rule the court attendants are reasonably fair and courteous towards the citizen, the litigant and the witness, although instances of tyrannical conduct occasionally oc-The court attendant has no right to bully or insult anyone He is paid to perform his duties courteously

To England we are indebted for our system of jurisprudence, for our institutions and for many of our political theories. There is, however, one additional particular in which courts might well imitate the example of the mother country, and that is courtesy. No one can travel in Great Britain without being impressed by the courtesy uniformly extended by everyone in every walk of life, especially is this true in the English courts. Courtesy is the solvent of life. It costs nothing and yet there are few things more valuable.

Dr Moss discusses the difficulties in which a

witness finds himself who is compelled to answer yes nor no will tell the truth, he is not obligated of a categorical answer. But the witness has a clear remedy for such an embarrassment he is not obliged to answer yes or no if the question is not susceptible of such an answer. His primary obligation is to tell the truth. If neither yes or no will tell the truth, he is not obligated to give an answer which necessarily will be false. His right, therefore, is to state, "I cannot answer that question truthfully by either yes or no." The writer has thus far failed to observe any case in which such an answer if fairly, justly, reasonably and honestly made did not enlist the support and protection of the court

Dr Moss discusses at some length the injustice to the individual resulting from the waste of his time in court. This is a fair complaint, but we have never heard a satisfactory remedy advanced. Courtesy upon the part of the lawyer summoning the witness, as well as consideration extended by the court will assist in the lessening of this evil, but that a witness may be compelled to waste some time, so far as the writer can observe, is an unfortunate but necessary concomitant in the administration of justice. The duty to obey a subpoena and to appear is one of the duties imposed upon every citizen in the same category as a duty to serve as a jurior or to accept

the call of a draft in war time.

The suggestion advanced that an expert's testimony might be taken by deposition, has been frequently put forward, but such a plan is contrary to the theories upon which our system of jurisprudence is based. Every party has a right to be confronted by the witnesses against him (unless such witnesses are out of the state, or they are dead, and their depositions have been Under the Roman law witpreviously taken) nesses largely testified by deposition, but that is not our system Through centuries of Anglo-Saxon experience it has been deemed necessary to the true administration of justice that the witness should be both seen and heard while he is In this way only can his veracity or his accuracy be thoroughly weighed

There is something fascinating about a court of justice. From time immemorial it has furnished material to the novelist, to the dramatist and to the historian. Laymen as well as lawyers are deeply interested. The stage of recent years has seldom failed to present during each season at least one play in which there is a trial scene. Discussion of this whole subject is salutary. Fair and intelligent criticisms, such as those urged by Dr. Moss, are always helpful. We believe that his paper is a real contribution.

to the subject

President of the Medical Society of the State of New York He first read the minutes of the afternoon session written in a humorous vein by an anonymous member He then spoke of the work of organizations of physicians in influencing legislators to establish official departments of health and to provide for the care of the insane, the physical examination of school children, and other public health activities in which the cooperation of the people was essential The responsibility at present is on medical organizations to a still greater degree to educate and lead the people and lay organizations in modern public health movements, such as diphtheria elimination, antituberculosis work and the establishment of county departments

The practice of medicine along business lines is an economic anomaly If doctors could carry out their ideals, they would annihilate themselves by eliminating the need for their services But disease and health dangers will probably always be present. Physicians treat disease because of a knowledge of facts, others treat diseases from the basis of beliefs and theories But new facts are constantly being discovered, and new possibilities of cooperation by the public are opening up as the people become educated in their appreciation of the work of the doctor Meetings such as these of the District Branches inspire physicians with an enthusiasm and inspiration to broaden their knowledge of the human body and its ability to combat its ills

Dr D S Dougherty, Secretary of the Medical Society of the State of New York, spoke The doctor of on the motives of physicians the altruistic days has not passed, and the family physician still remains and relieves human ills for the sake of humanity Physicians do not believe in those who say there is They get nothing in life except materialism delight from doing service Doctor Dougherty said that the greatest and most satisfactory fee he ever received was the kiss of a thirteenyear-old girl whose tonsils he had removed He urged physicians to live up to our code of ethics like gentlemen, and to stand upright before God and man, ready to serve those in

Mr Lloyd P Stryker, Counsel of the Medical Society of the State of New York, told of the point of view of critics of the medical profession, many of whom he meets constantly in his work of defending malpractice suits. He spoke of the generous acts of physicians who testify on behalf of their medical brethren who are defending themselves against malpractice charges. But every suit is dependent on the testimony of some medical man who is put upon the witness stand as an expert to give his judgment regarding the correctness of the

treatment of his brother doctor, and sometimes the witness is not the expert that he claimed to be Mr Stryker urged that physicians should devise some method of certification of those who are really expert, in order that the people and courts may be able to recognize the actual expert (See the report of the committee of the New York Academy of Medicine, on page 1183)

Mr Stryker also discussed the education of the people regarding the nature and value of the services of physicians This is the day of publicity, and every person that has a message Physicians do not use novel discoveries in practice until the value of the new method has been demonstrated on guinea pigs, but the people do not understand these things The people on subway trains are reading the fundamentals of philosophy, science, and history because writers have described the essentials of those sciences in simple form same opportunity rests upon physicians to educate the people in medical matters opportunities for doing this are many There are local campaigns for protection against diphtheria, tuberculosis and cancer Physicians have something important to tell the people on all these subjects Don't wait for the people to beg for advice and information. Anticipate their requests and inform them through county medical societies Assert your influence as the leaders of popular medical thought the precedents that have been set by a few county medical societies, and make an organized effort to impart educational matter to your people medically

The relation of physicians to the practice of civic medicine was discussed by Dr James E Sadher, who successfully passed the tests of the school of the presidency of the Medical Society of the State of New York last year, and is now practicing the public health specialty of civic medicine as chairman of the Committee on Public Relations The special field of this committee is the relation of family doctors to the volunteer lay organizations which now occupy the field of the practice of preventive medicine This field was entered by physicians as long ago as 1873, when a committee on hygiene of the Medical Society of the State of New York began to be active in the prevention of disease (see the history of the movement on page 1180) But the work was later assumed by volunteer organizations endowed with abundant funds to hire their own workers and publicity agents lation of these volunteer workers to physicians was the subject of long discussion by representatives of the two groups of workers, and principles of agreement were reached story of the opposing views of the laymen and physicians needs yet to be told for the instruc-

NEWS NOTES

FOURTH DISTRICT BRANCH MEETING

The series of annual meetings of the District Branches of the Medical Society of the State of New York was begun on Friday, September 21, when the members of the Fourth District met in Ogdensburg for a two-days' session under the leadership of Dr Lyman G Barton, of Plattsburg, President of the Branch Dr Barton was assisted by Dr T A Lewis, of Hammond, President of the St Lawrence County Medical Society, and by a local committee from Ogdensburg, consisting of Dr F C Clark, Dr J E Meeker, and Dr R L Stacy The attendance was over 100 out of a possible District membership of about 500, or a percentage of twenty of the entire member-This large attendance was the more notable because the District comprises all the Montgomery, Schenectady, counties from Saratoga, Washington and Warren, and those lying north of them The average distance that the members had to travel was well nigh one hundred miles

The meeting was held in three sessions 1, an afternoon meeting in Curtis Hall of the St Lawrence State Hospital, 2, a dinner meeting in the evening in the Ogdensburg Country Club, and 3, a morning session on September

22 in the Country Club

The first speaker on Friday afternoon was Dr Harry R Trick, President of the Medical Society of the State of New York Dr Trick emphasized the opportunity which the District Branches afforded the officers of the State Society to become acquainted with the members throughout the State, and to explain the plans and activities of the State organization, and thus stimulate the activities of the County Societies He spoke especially of three lines in which the State Society is of benefit to the individual members

1 Protection against malpractice suits

2 Helping them in gaining advanced knowledge

3 Promoting the reputation and standing of the physicians in the community

Dr Trick explained some of the methods by which these objects are promoted by the State Society. He also suggested that papers on the history of the Medical Society of the State of New York would be desirable on the programs of the County Societies, for it would reveal that physicians have always been leaders in the promotion of health, even to the most intense efforts to exterminate the very condition

of sickness on which the demand for their services was based

Dr Grant C Madill, of Ogdensburg, reviewed 500 consecutive cases of appendicitis which he had treated in the Ogdensburg Hospital He discussed the difficulties of diagnoses in some cases, the complications that were encountered, and the class of cases of fatal sepsis in which the patient feels comfortable and cheerful as if he had taken a large dose of morphine Dr Madill's discussion was intensely practical and of universal interest, especially in view of the recognized fact that the death rate from appendicitis is increasing Dr Madill's address was an argument for early diagnosis and prompt surgical treatment

The malarial treatment of general paresis was discussed by Dr H J Worthing, Clinical Director of the St Lawrence State Hospital The doctor also described the method of treatment with tryparsenide,—an arsenical whose action is milder than that of salvarsan. He said that 70 cases had been treated with malaria in St Lawrence Hospital, and that 35 had improved,—21 to such an extent that they had left the hospital and were earning their own living Doctor Worthing showed six cases that had received the treatment with both malaria and tryparsenide. The cases showed all degrees of reaction from none at all to apparent cures.

Dr Elton Goldbloom, of Montreal, was present by invitation, and read a paper on "The Role of the Physician in the Bringing up of Children" He emphasized the fact that the specialty of modern pediatrics was the application of general medicine to an age group, and that its practice was mainly along the lines of preventive rather than curative medicine The pediatricians exemplified the principles of the periodic examination

Doctor Goldbloom gave practical advice along lines which will be of great interest and value to every family doctor. His complete paper will be published in an early issue of this Journal, probably on November first

The evening meeting was begun with a dinner at which the St Lawrence County Medical Society was the host to about one hundred and fifty members and their wives and ladies. The after-dinner speaking was devoted to a discussion of medical society problems. Dr C A. Lewis presided

The first speaker was Dr Harry R Trick,

after discussing them in their own societies to forward them to this body. General interest in the study will grow up in such localities, causes of disease will be recognized which heretofore the physician has been indifferent to, while their aggregation in the hands of this society will go to establish sanitary laws which observation in limited localities fails to establish."

"Resolved, that the secretary send a circular to each county society to collect and discuss facts in accordance with the recommendations of the President"

Dr Bell continued to be a member of the State Committee on Hygiene for many years, but on June 21, 1877 he relinquished its chairmanship to Dr Enoch Vine Stoddard, who had been commissioner of Health of Rochester from 1873 to 1875, and was professor of materia medica and therapeutics in the University of Buffalo, and later was President of the State Board of Charities He died in 1905 aged 69 years He seems to have been intensely practical and to have striven to put the abstract principles of public health into concrete operation The idea of a county health department was no day dream, conceived in a closstered office, but it was an evolution and development based on actual experience

The activities of the State Committee on Hygiene for ten or twelve years seem to have been confined to securing and publishing sanitary reports from those counties which made the investigations and reports spontaneously, but the idea put forth by Dr Agnew in 1873, that a Committee on Hygiene be formed in every County Society, was urged in a concrete way in 1885. The transactions of the State Society for that year, page 293, say

"No special pressure having been made upon the members of our County Societies, but little work contributory to this report has been secured from them By a direct effort by this Committee, through our county societies and by the latter, in the local boards of health throughout the State, much may be accomplished before the coming summer begins to secure improved sanitary conditions. Cooperative efforts with local boards of health, especially if participated in by the profession generally, will strengthen greatly and render more widely effective the efforts of our State Board of Health in this direction."

"We would emphasize the importance of maintaining an active Committee on Hygiene in each county Society, through whom a direct communication can be maintained with its members, and effective work secured by this Committee."

The Committee's report of 1886 became more tangible and concrete in that it suggested the investigation of the sanitation of public

institutions as the special activity and county Committees on Hygiene The report says

"Your committee decided to urge a careful investigation of the sanitary conditions of the public institutions of the State The Committee urges upon each county society the necessity of having, as a part of its organization, an active Committee on Hygiene under whose direction work of character can be efficiently performed Each county society can thus secure a full report upon the institutions within its limits and forward them early to this Com-It is suggested that in all sections of the State, extensive excavations about such institutions, during the summer months be discouraged, especially when connected with lines of drainage or sewage or with neglected vaults or cesspools"

The next annual report of the committee, recorded in the Transactions of 1887, page 528, introduces the idea of educating both doctors and the people in public health. It says

says
"The failure to maintain a committee on hygiene in many of the county societies is a source of apathy on sanitary questions among the profession and the public in such counties. There has been an improvement in the sanitary condition of the public institutions of the State, yet such improvement is necessarily slow, and dependent upon a better educated public opinion to be achieved by effort of the medical profession mainly, and sustained by legislation"

The Committee became still more concrete in its suggestion in its report of 1888, page 530 of the Transactions which discusses the health departments of cities, and says

"The field of observation during the year 1887 has been chiefly with regard to organization of local boards of health. One of the efforts has been to secure the formation in each county society of a standing committee on hygiene, in the belief that this would serve as a direct source of communication between this committee and the profession at large."

The report of 1889, page 530 of the Transactions, records the extension of the investigation of the boards of health of cities, so as to include the boards of health of villages and towns. It says

"Your Committee on Hygiene reports that the line of observation followed has been the working of the present system of organizations of local boards of health and their efficiency of administration. Over 1200 local boards of health have been established during the past eight years, and a consequent vast improvement in sanitary conditions has been the result."

The report also refers to failures of the system and devotes half a page to an argument that

tion and guidance of the country societies which are already assuming the leadership in medical civics. The physicians of Suffolk County have demonstrated that physicians can secure a county health unit if they desire it, and those of Dutchess County have demonstrated how physicians can conduct and manage all kinds of public health work among babies and young children. Other counties are taking up the work, and the time is ripe for the assumption of public health work by every county medical society.

Every county society needs a committee on public relations that shall advise the people and lay organizations in public health and civic medicine, just as family doctors advise individuals. Choose as the chairman the strongest and most influential doctor in the line of work, in order to place all physicians in the proper light as leaders in public health

Dr John A Card, Speaker of the House of Delegates, explained the increased premiums charged by the Etna Life Insurance Company for policies of indemnity protection, saying that they were based on actual experience in defending malpractice suits. Since the number of these suits is increasing, the premium charge must likewise increase.

A committee is studying the problem, and will make a report in the near future. In the meantime, Dr. Card advised physicians to continue to patronize the Company which the officers of the State Medical Society had chosen after mature investigation and deliberation.

The evening meeting was remarkable for the close attention that was given to every speaker, and for the informal conversations carried on after the meeting among groups of members

The Saturday morning session carried out a program as follows

"Business Meeting

"Election of Officers

"Hypertension, James Francis Rooney, M

D, Albany, (by invitation)

"Management of Pathologic Labors with special reference to Maternal and Infant Mortality, Lyman G Barton, Jr, MD, Plattsburg, Discussion by William M Mallia, MD, Schenectady

"Public Health Creed, William M Munson,

M D, Granville

"The Relation Between Injury and Tuberculosis, Edward N Packard, M D, Saranac Lake"

A COUNTY HEALTH UNIT PLANNED IN 1889

In the late eighties and early nineties three great movements were being discussed by the medical profession in New York State. Two of these movements were a State examination for a license to practice medicine, and the transfer of the care of the insane from the Counties to the State. Both of these objects were attained by the year 1892.

A third great movement was the promotion of county departments of health, yet thirty-five years elapsed before the first county department was organized, and forty before the second was authorized The story of the movement is recorded in the Transactions of the Medical Society of the State of New York which shows the idea growing and developing in a most striking way from its birth in a series of scientific papers on sanitation, through a babyhood largely ignored by physicians and the public, to precocious maturity, and an untimely death from malnutrition The plan of modern public health administration was set forth forty years ago, but the people were not ready to accept it, and the medical profession did not have the organization to secure its adoption

The story of a movement for a county department of health centers around the Com-

mittee on Hygiene of the Medical Society of New York, in which two leaders stand out prominently, Dr A N Bell of Brooklyn and Dr Enoch Vine Stoddard of Rochester

Dr Bell was a Virginian, who was born in 1821 He graduated from Jefferson Medical School in 1842, served in the U.S. Navy and the Mexican War, practiced medicine in Waterbury, Connecticut, and came to Brooklyn in 1855 where he remained until his death in 1911 aged ninety-one years He founded "The Sanitarian," a monthly journal of public health, in April, 1873, and published it for 31 years He was chairman of the Committee on Hygiene of the Medical Society of the State of New York in 1873, when Dr C R Agnew became President of the State Society The first article in the first number of The Sanitarian is Dr Agnew's inaugural address in which he urged the doctors to take part in public health movements especially the care of the eyes of school children. At the end of the address the Reference Committee on the address reported

"In compliance with the suggestions of the President, we recommend that every County Society should have a standing committee to gather facts in their respective localities and

THE CERTIFICATION OF SURGEONS

Surgery is the most common specialty to which physicians aspire. Every doctor can use the kinfe, the scissors, and the needle to some extent, but their use does not indicate that a man is a surgeon, any more than the use of a saw and hammer indicates that an amateur corpenter is an architect. The qualifications of a surgeon are of the same high degree as those of an architect. How to educate a doctor to be a surgeon and to certify his qualifications, was the subject of a report of the subcommittee on Surgical Courses of the Committee on Medical Education of the New York Academy of Medicine. This report was made in May, 1928, and an abstract was printed in the August Bulletin of the New York Academy of Medicine. This abstract is entitled "Suggestions for Improving Post-Graduate Teaching in the Operative Specialties," and is here reproduced—Editor's note

A review of the post graduate courses offered in the surgical specialties in New York City give the distinct impression that they are inadequate and that there is need for improvement. New York City with its enormous clinical facilities should be the teaching center of the western hemisphere. It should be a place where specialists are trained and where doctors may come to improve themselves in their respective specialties.

There is at the present time no adequate control over physicians who propose to practice a surgical specialty or who are doing surgery, nor is there any prescribed method of procedure by which one may qualify as a sur-It is true the American College of geon Surgeons requires the submission of a certain number of case-records before a candidate is admitted to membership in that body, but there is no supervision or requirement regarding the obtaining of these records It seems that the entire system of developing specialists may well be changed Graduation from a recognized medical school or even graduation from a general hospital is hardly sufficient to qualify the average doctor as a specialist in any of the surgical branches It would seem wiser to require a special period of training for every physician who intends to become a specialist in one of the operating specialties Of the many house surgeons who are being graduated from general hospitals only a small percentage can ever hope to become members of the attending staff The majority enter general practice after a hospital course which has been largely specialistic, and much of the training has been wasted on them We would therefore suggest that an attempt be made here in New York City to get the various hospitals to agree upon some definite plan for improvement.

New York University and Bellevue Medical School has taken the initial step in this regard by establishing a course of post graduate instruction lasting 2½ years. It is composed of laboratory work, demonstrations, lectures and practical hospital work. During the latter period the student assumes the position of an adjunct surgeon and actually performs operations. Such a course may well serve as a guide, on the other hand the following plan may be more satisfactory for a larger group

The majority of the New York hospitals offer a general course of interneship of about 2 years, emphasizing either medicine or surgery, as the case may be We would suggest that an attempt be made to get all hospitals to agree to offer a general course of one to two years to include medicine, surgery, obstetrics, gynecology and all the specialties as far as they are able to, in order to fit a candidate for general practice. None of these graduates however should be permitted to pose as specialists or to perform major operations.

Those men who during their interneship show special desire or inclination to perfect themselves in a given specialty should at the end of their period be eligible for appointment as fellow or resident to serve a given period of one to two years, during which time they should be given opportunity to perform major operations and to study every phase of their specialty in the wards, the laboratory the clinic and the x-ray department. We feel that there is a trend along this line at the present time, and that we in New York City should anticipate it and take steps in this direction

Those men who desire to take up the various specialties such as ophthalmology, otology, laryngology, urology or any other subdivision should try to get appointments in special hospitals devoted to those subjects or in the specialistic departments of the larger general hospitals

The Committee recommends the establishment of some organization which will work out a detailed plan along the lines indicated. The Academy of Medicine would be the logical institution to do so perhaps in collaboration with the well-endowed medical schools and all the larger hospitals of our city that are willing to co-operate. The entire plan would be voluntary on the part of the interested institutions.

The Committee in charge might be authorized to confer a special surgical degree or diploma on the candidates taking the course. In case the plan proves successful an attempt might be made to make it national in scope. It would seem that the American College of Surgeons should have a sub-department to study the entire problem of post graduate teaching of surgery in America.

a physician does not make the best sanitarian or health officer. The report also deals with the composition and appointment of boards of health.

The most interesting part of the report deals with the territorial unit of a board of health, and makes the suggestion that the County be

made the unit The report reads

"By establishing the county as the unit, the number of health boards in the State would be greatly reduced, the relation of the State Board to the local boards would be greatly simplified, and more direct and hence greater efficiency and uniformity of sanitary administration could be secured. The economy of such a system is also apparent. The health officer could be assured a sufficient salary to devote his entire time to the work, and also which is very important, he could be a trained sanitarian not a practising physician, and be continued in office. The county seat would thus become the sanitary center of the district."

"The committee suggests that it be instructed to make this a special line of observation during the coming year, and at the next annual meeting to report in a definite form upon existing embarrassments in the administration of the local health boards of the State with suggestions for their remedy, looking to

future legislative action"

"The committee would invite special consideration of the question as to the change from the village to the county as the unit of territorial organization. This is not a new thought but has been for a time under consideration, though not generally entertained and urged among the profession, but we believe when fully comprehended, must recommend itself to those acquainted with a sanitary organization and interested in securing its efficiency."

The Transactions of 1890, page 323, contain a lengthy outline of the proposed county departments which are embodied with scarcely a change in the present plans for county Health Departments The following extracts will indicate the general scope of the plan

"Your committee has continued the consideration of more efficient sanitary administration in the local boards of health in this State. The adoption of the town or village as the basis of organization has inordinately multiplied the number of boards of health and detracted from their responsibility. Hence inactivity and indifference are common conditions in all sections of the State. The adoption of a larger unit of territory would insure a closer and more active organization and greater efficiency."

"The unit of territory should be changed to the county The position of health officer should be so modified as to place a trained

sanitarian in the position"

As to the suggestion that trained sanitarians be appointed health officers, the report

says

"We would specially emphasize the statement that the *practising* physician does not make the best sanitary officer. While physicians ordinarily make good sanitary teachers, special training other than the practice of medicine is necessary for the successful sanitary officer. Yet the medical profession must be relied on to furnish the personnel for trained sanitarians."

The report devotes two pages to an outline of the organization of the county department of health and its administration. While it would abolish the local health boards, it makes provision for local representatives of the county health officers as follows.

"The Health Officer should appoint a special inspector for each sub-district in his county. These sub-districts should be based on population. The special inspectors should be medical men, and be paid a fixed salary."

Discussions of the County Health department closed abruptly with the 1890 report The Committee on Hygiene made only a brief report in 1891. It simply referred to its report of 1890 and reiterated the conclusions of that year. The Transactions for 1891 also record the election of another chairman of the Committee on Hygiene to succeed Dr. Stoddard, but the Committee made no report in 1892.

JEFFERSON COUNTY

A regular monthly meeting of the Jefferson County Medical Society was held in the Carlowden Country Club, Watertown, on September 13 The afternoon was spent in a golf tournament

After a social dinner in the early evening, Dr C R Comstock, of Saratoga Springs, gave a paper on "The Rôle of the Health Resort in the

Treatment of Cardiac Cases," founded on experi-

ences in Saratoga Springs

Dr Page E Thornhill, of Watertown, showed moving pictures illustrating the method of making prenatal examinations in the doctor's office. These photographs are on 16-millimeter film and are well adapted for showing before county societies.

MEDICAL WARES

CAMERA TYPES

The physician buying a photograph camera for general use will have three types from which to choose

1 The universal camera,

2 The hand camera,

3 The short focus camera

The ideal camera is one which can be used for all the common purposes to which the camera is likely to be put. A physician will be likely to use a camera for at least four purposes

1 Taking outdoor views of landscapes, build-

ings, and persons,

2 Photographing scientific specimens up to life size,

3 Copying cuts, pictures, etc.,

4 Making lantern slides

A camera which will do these four things is in ordinary box camera taking pictures measuring 4 x 5 inches. Its back will open upon a ground-glass on which the image may be composed and focused. It will also have a finder for showing the field which is being taken. Its lens will have a focal length of five or six inches. Its bellows may be drawn out to twelve inches or more in order to take photographs of small objects. Its shutter will be of high grade in order to be accurate, reliable, and durable Cheap shutters are like cheap watches.

The limitations of a 4 x 5 inch box camera are principally those resulting from its size and the complexity of its action. It is too large for easy handling and transportation, and the operator must keep a number of adjustments in mind while taking a picture, and the cost of its plates and films is considerable. The principal use to which an ordinary camera will be put is that of taking outdoor snap shots, and the photographer can take these with a hand camera that is greatly simplified and yet retains the essential parts that make it adapted to this one class of work. The word "kodak" is a trade name, but the dictionaries now list it as a term commonly applied to any camera that may be conveniently carried in the coat pocket

The market is supplied with hand cameras that are simplified to the last degree. One dollar will but a reliable camera, but it will have a shutter of only one speed. Its lens will be listed F-11, and it will have a fixed focus, usually set for

an object at a distance of ten feet Such a camera will take a satisfactory picture of an object ten feet distant from the camera and in a good light, but it has its grave limitations

A box camera satisfactory to a physician will have a focusing device for objects up to five feet, a lens listed F-45 or F-35, and a high-grade shutter that gives a large range of exposure speeds. The size of the picture will vary with that of the camera, but 2½ by 4¾ inches is the most popular size. A negative of this size will permit a lantern slide to be made by direct contact,—a point of importance to a physician

The evolution of moving pictures to a high degree of perfection has resulted in the designing of small hand cameras that use a strip of moving picture film and take a negative 3% by 1% inch in size,—the dimensions of an individual photograph of a moving picture Cameras are now available small enough to fit into a coat pocket, and yet they will take fifty pictures with one loading of film A camera of this type has a lens between one and two inches in focal length, graded at F-35, and with a focusing adjustment up to three feet, or to three inches when an accessory lens is used. The shutter provides for a wide range of exposure, and an accurate finder makes the centering of an object easy. If care is taken to focus a camera accurately, to adjust its shutter to light conditions, and to hold it still while taking the picture, the photograph will have the sharpness of a high-class moving The short focal length of such a camera makes it possible to take satisfactory pictures through the window of a moving automobile or railroad train,-something uncertain with a camera of any other type A physician using the camera on a trip and snapping objects of interest as he rides, will have a photographic record of his tour which he can project on a screen for the benefit of his friends. He can also have satisfactory enlargements made up to the size of pictures taken with an ordinary hand camera The cost of a camera using movie film is about that of an ordinary hand camera, but the fifty pictures which it takes at one loading will cost about the same as the six pictures taken with one loading of a larger camera

GRADUATE COURSES

Dr Thomas P Farmer, Chairman of the Committee on Public Health and Medical Education, announces the following courses for County Medical Societies

Delaware County -- Course in Tuberculosis, arranged by Dr Edward R Baldwin, to be given at the Delaware County Tuberculosis Sanatorium, Delhi, N Y

Program

September 20th-Pathology and Bacteriology, Dr L U Gardiner, Saranac Lake, N Y September 27th—Diagnosis, Dr H S Bray,

RENSSELAER COUNTY

The managers of Pawling Sanitarium, the Rensselaer County Tuberculosis Hospital, entertained the County Medical Society with a clam bake on September 18th, and more than one hundred physicians accepted the invitation

The Sanitarium has 134 patients, 36 of whom are children For the education of these children a school district has been formed in the Samtarium, as has been done in the Suffolk County Sanatorium

The board of managers recently invited the Medical Society to name members qualified in orthopedics, general medicine, general surgery, psychiatry, urology, and eye, ear, nose and throat, to serve on the consulting staff. The board has also made the suggestion that next year the persomel of the staffs be changed, so that in time every physician in the county qualified to do so, may have an opportunity to serve on one of the staffs

PRIVILEGED COMMUNICATIONS

The following editorial from The New York Sun of May 8 will be of interest to physicians.

"Facts learned by a physician making an autopsy are not within the statutory privileges of communications between doctor and patient, according to a decision of the Federal Circuit Court of Appeals for the Iowa district

"A resident of Iowa who carried an accident policy in the sum of \$7,500 was in the habit of making his own gin He died in April, 1927, after drinking about six ounces of the synthetic mixture Analysis of the gin revealed the presence of wood alcohol physician who attended him testified that independent of other causes the quantity of wood alcohol was sufficient to cause death An autopsy was made by another physician who had never seen the victim alive found a progressive tumor in the brain which he said must necessarily have resulted sooner or later in the rupture of a blood vessel fact, a hemorrhage therefrom had occurred in the brain, and death was not due to accidental poisoning

"The physician was not permitted to testify for the insurance company when suit was brought by the beneficiary of the policy, on the ground that his knowledge was privileged new trial has been ordered by the Federal court so that the insurance company can have the benefit of the evidence of the autopsy The court said that a deceased body was not a patient. If the physician performing the autopsy had been the physician of the deceased during his illness, it would be required that he should not disclose facts which came to him when the professional relation existed, but he might testify to the discoveries of the autopsy The relation of physician and patient ended, the court said, when death of the patient ensued"

FACIAL EXPRESSION OF CHARACTER

Does the expression of one's face reveal one's thoughts? It often does in the presence of strong emotions, and actors study the expressions which indicate joy, sorrow, wonder, fear, and amusement But the expression reveals nothing of the cause of the emotion, and yet a belief in facial expression as a revealer of thoughts and character is almost universal

The New York Sun of September 11 describes an experiment conducted with the psychology class of a New England college, as follows

"There are a number of people in the world who will be cheered to learn from two Connecticut psychologists that it is next to impossible to tell from a boy's exterior whether he will turn out well or not. The two experimenters selected the five most successful lawyers, doctors, teachers and engineers from a university class graduated twenty-five years ago and the five members of the class who had attained the least worldly success in each of these fields They had photographs of the forty men, taken at graduation and again twenty-five years later, and submitted them to twenty psychology students The students were expected to judge the success or failure of each one and at the same time to guess the profession of each

"The guesses were so far wide of the facts that the two experimenters believed that they had come upon a truth, regardless of the scope of the experiment Half of the psychology students, for instance, thought a successful engineer was really a minister Six of the twenty called an unsuccessful teacher a successful banker Nor were the students any shrewder in forming judgments from an examination of the photographs taken twentyfive years ago"

VACCINATION AND ENCEPHALITIS

The following news item in The New York Times of August 23 is quoted in order to show the flimsy basis for the propaganda against vaccination

"The development of a dread sleeping sickness disease, known to medicine as encephalitis lethargica, as the result of vaccination to prevent other diseases, was brought to the attention of the League of Nations Health Committee's Commission on Smallpox and Vaccination today

"Several countries, particularly England and the Netherlands, have notified the League of occasional cases where vaccination has engendered the sleeping sickness In the Netherlands the condition was so bad that compulsory vaccination in the public schools has been suspended for a

"The commission plans to undertake extensive field inquiries in selected areas and countries where post-vaccinal sleeping sickness showed signs of developing'

THE DAILY PRESS

LEPROSY HOSPITAL ENDOWMENT

The campaign for raising a two-million-dollars endowment for a leprosy hospital in the Philippine Islands as a memorial to General Wood, was mentioned in the Daily Press department of this Journal of May 15, 1927 The New York Times of September 12, 1928. has an editorial comment on the progress of

the campaign, and says

"Mr Rockefeller's gift of \$100,000 to the Leonard Wood Memorial Fund for the Eradication of Leprosy brings the total so far raised to more than \$1,000,000 This is enough to assure the necessary buildings and supplies in the Philippines, but another million is still needed in order to carry out the project of increasing the personnel sufficiently to make possible the final eradication of leprosy throughout the islands The drive for the second million is being carried on largely through the efforts of Mrs H Windsor Wade, wife of the American doctor in charge of the leper colony at the island of Culion has given generously The rest of the country is now to be canvassed

"Thanks to the gift of Mr Eversley Childs a new hospital plant is being built at Cebu to handle the mild cases This building is to have facilities for the treatment of 1,000 pa-Culion at present has facilities for tients 6,000 patients The plant is being improved and new equipment being installed Governor General Stimson has arranged to have the work of renovation proceed at once

"At the same time Governor Stimson has sought assurances that the remaining \$1,000,-000 will be raised so that there will be funds on hand to assure furnishing the proper per-He has pointed out that the Philippine Government, which already spends more than \$2,000,000 on health work—a large item for a country of only 12,000,000 inhabitantsis unable to assume an extra charge of \$150-000 a year or more for leprosy treatment It is therefore particularly important that the remainder of the desired fund be raised as soon as possible The cause is one of such wide appeal that it is sure to evoke a generous response"

DEATH RATES IN LIFE INSURANCE

The New York Sun of August 18 says editorially

"It is good business for insurance companies to spend money in campaigns to reduce the But if it is good business for death rate policyholders to undergo periodic health examinations, to be educated in personal hygiene, it is equally good business for all others to do the same things

"Most educated persons are fairly well informed as to ordinary hygienic precautions required to safeguard health The idea of obtaining competent physical inventories now and then by persons seemingly in good health is not so widespread Nevertheless, if it is good business for insurance companies to spend large sums persuading their clients of the advisability of this course, it is again good business for others to do the same thing Those figures showing a saving of 18 per cent of mortality for 6,000 persons undergoing such examinations are indeed eloquent"

Unfortunately some officials of life insurance companies say that their business does not require them to consider death rates ex-

cept to charge enough to cover any reasonable losses, because if more is charged than is needed to pay death claims, the excess must be returned to the policyholders in the form of so-called dividends However, the editorial in The Sun quotes Dr Lee K. Frankel, of the Metropolitan Life Insurance Company, who shows that deferring death for years does pay He says

"More than forty-five life insurance companies have undertaken campaigns to bring their policyholders to periodic health inven-Of 6,000 Metropolitan policy-holders thus examined it was found that there was a saving of 18 per cent in the expected mortal-This work is supplemented by educational programs for instruction of policy-hold-

ers in personal hygiene

"The expectancy of life among industrial policy-holders is now eight years longer than It means that the company's it was in 1911 mortality for the period 1911-1926 shows a saving over and above that in the registration area of 278,395 lives and a saving in death claims of more than \$64,000,000"

DIAGNOSIS AND TREATMENT IN DISEASES OF THE LUNGS
By Frank E. Tylecote, M.D., and George Fletcher,
M.A., M.D. 12mo of 270 pages London and New
York, Oxford University Press, 1927 Cloth, \$2.25
(Oxford Medical Publications.)

This is a rather useful compendium from the pens of two distinguished English Internists, both of whom have had considerable experience in the field. Both are excellent teachers. A careful perusal of the pages fails to reveal any strikingly original line of thought, either in the presentation of the subjects themselves, or in the method of arrangement of texts

Everything written therein has been done many times before, possibly no better or no worse. The book has the virtue of brevity, however, and as such would appeal to many of our over-rushed practitioners who prefer their education nourishment handed to them in capsules

FOSTER MURRAY

AALE. For Practition-

GONOCOCCAL URETHRITIS IN THE MALE. For Practitioners. By P S PELOUZE, M D Octavo of 357 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928. Cloth, \$500

The subject of Gonorrhea has been one of vexation for many generations to the practitioner Dr Pelouze, in his book, approaches this subject in a manner distinctly different, and in a short review it is difficult to express our entire appreciation of his work.

The chapter on the culture and peculiarities of the gonococcus is especially interesting, including as it does a description of Dr Pelouze's new method of culture. He expounds an interesting theory on the influence of cell types in the posterior urethra on the frequency of complications, also as to the cause of epididymitis (the carrying of an infected mass of material directly to the epididymis instead of the old idea of extension of infection in the vas)

of extension of infection up the vas)

The method of treatment followed by Dr Pelouze is novel and contains many ideas which we are sure are of great value in lessening the incidence of complications. This volume is a real addition to the library of anyone interested in Gonorrhea and has given the reviewer real enjoyment in its review.

FEDOR L SENGER.

THE CHARACTERS OF THE HUMAN SKIN IN THEIR RE-LATIONS TO QUESTIONS OF RACE AND HEALTH By H. J FLEURE, The Chadwick Trust First Lecture in Memory of Sir Malcolm Morris, M D Octavo of 32 pages New York and London, Oxford University Press, 1927 Paper, \$.85

The author of this monograph dedicated to the memory of Sir Malcolm Morris, M D, has spent a great deal of time in studying the characteristics of the various racial groups, and delving into their antiquity. In this paper he points out the variations in texture, circulation, and pigment formation of the skin, as well as the variations in quality, quantity, and other characteristics of the hair of different peoples. He finds that there is a relationship between the skin and hair, and other racial characteristics whereby suggestions are made as to the migration of these people from prehistoric times.

There is no doubt that his researches have led him into a great deal of speculation regarding evolution from the lower animals to the human race, as well as the evolution from prehistoric man to the scattered racial groups of today. The effect of climate on the original groups is shown, also how, since those early days, man has caused himself, frequently, to live under conditions for which his individuality was not specifically constructed.

The paper is not a story and requires an interest in the subject on the part of the reader or he will not tarry long with it. However, we may say that it has been well written, and is not as boresome as might seem at first glance.

E. A. G

FOLKLORE OF THE TEETH By LEO KANNER, M.D. Octavo of 316 pages, illustrated. New York, Macmillan Company, 1928 Cloth, \$400

Putting in one's hand an interesting and readable reference book of dental folklore of many peoples from many lands, recounting the faiths, the hopes, the superstitions, and the religious significances akin to the dental mechanism is commendable enough. But Dr Kanner has gone still farther, he has presented a book so complete that the reviewer recommends it as a permanent addition to any library, be it professional or lay

It shows years of study and collection of data from the literature of many lands, a most prodigious effort to present the subject in a readable manner covering it as completely as anyone might expect.

The illustrations do not enhance the looks of the book so they might easily be dispensed with

The work contains a complete and extensive bibliography The one great omission which depreciates the value and use of the contents of the book as a work of reference is the lack of an index.

Buy the book and keep it. It is worthwhile.

LEONARD KOHN, DDS

A Text Book of Infectious Diseases Being the Third Edition of Goodall and Washbourn's Manual of Infectious Diseases Revised and in large part rewritten by E. W. Goodall, O.B.E., M.D. Octavo of 718 pages, illustrated New York, William Wood and Company, 1928. Cloth, \$1000

The mineteen years that have intervened since the last edition of this book was written, have added so many new things to our knowledge of infectious diseases that the author has therefore largely rewritten the present volume.

The book includes a description of all the acute infectious diseases which occur in our temperate climate After an introduction, the succeeding five chapters are devoted to a consideration of the general topics respectively of fever, contagion and infection, disinfection, rashes simulating those of the specific fevers and sore throat. Then follows a chapter devoted to each of the acute infectious diseases, including in addition to the more common exanthemata, diphtheria, pertussis and mumps, such infections as epidemic encephalitis epidemic poliomyelitis, cerebro-spinal fever, typhus fever, relapsing fever, anthrax and glanders. The book is completed by six short appendices treating of such general topics as anaphylaxis, cerebro-spinal fluid, lumbar, cisterne and ventricular puncture, dietary scale, and table of infectious diseases.

The descriptions of the respective diseases vary considerably in length and completeness according to the importance of the disease treated. The book is primarily clinical but does not fail to include the necessary facts on bacteriology and morbid anatomy. The subject matter is up to date and is clearly and well presented in an interesting style. The literature is referred to in places, but the book is not overburdened with references. The printing, illustrations and binding reflect credit on the publisher. It is altogether a good and useful book to have.

JOSEPH C. REGAN

THE EXAMINATION OF PATIENTS BY NELLIS B FOSTER, M D Second Edition, revised Octavo of 392 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, \$4.50

This second edition of Foster's work on the examination of patients is more than a revision. The first edition was most favorably received because it made one pause to consider many of the apparently minor details of physical diagnosis often overlooked and made one realize that errors are made because of lack of thoroughness and attention to details. This edition has emphasized the importance of differential diagnosis in arriving at a definite diagnosis of disease present in a patient with emphasis on the importance of the clinical findings. This is a valuable work.

HENRY M MOSES

BOOK REVIEWS

MODERN METHODS IN THE DIAGNOSIS AND TREATMENT of Renal Disease. By Hugh McLean, MD Third Edition, revised Octavo of 135 pages, illustrated Philadelphia and New York, Lea and Febiger, 1927 Cloth, \$2.75 (Modern Medical Monographs) Cloth, \$2.75

This brief little book contains much valuable information in condensed form While it is intended for the busy practitioner, there is essential information for the internist and urologist.

The author stresses the importance of the clinical side, but, at the same time, describes the various labora-

tory methods and gives them due credit.

The urea concentration test was introduced by Mc-Lean, and he regards it as exceedingly useful, also simple and practical He has used it in over ten thousand cases

The urologist Sir Thomson Walker employs this test as his chief guide for operative risk as regards renal

It is interesting to note that the author employs high protein diet in the hydremic parenchymatous nephritis cases and he refers to Epstein's work in this field. In the discussion on "acidosis," there are several practical points which help the reader to a better understanding AUGUSTUS HARRIS of this condition

STRABISMUS Its Etiology and Treatment By OSCAR WILKINSON, A.M., M.D. Octavo of 240 pages, illustrated St. Louis, The C. V. Mosby Company, 1927 Cloth, \$1000

It has been said that the most ungrateful patients that a surgeon cares for are those who apply for cosmetic surgery No matter how much the original condition is improved the subject is not pleased. This seems to be so as regards squint particularly, so that this work should be a valuable addition to the ophthalmologist's

library for that reason if for no other

This book outlines the history of the subject in an interesting manner. The second chapter on anatomy is well presented as are the fourth and fifteenth chap-

ters on the physiological aspects

In the sixth chapter an analysis of the types of squint is undertaken and methods of measuring the deformity are discussed

Dr Wilkinson's device for measuring squints seems to offer many advantages over the numerous other

methods

A separate chapter is devoted to paralytic strabismus, the ninth chapter deals with the methods of examination The last two chapters take up respectively of the cases the nonoperative and operative treatment

An appended chart gives illustrated cases

The reviewer feels that the visual fields should have had more consideration, particularly as the aspect bears so directly upon the etiological theories Perhaps the author did not feel that a sufficiently concrete material is at hand from which to draw

The book is well and clearly written, the illustrations are satisfactory, the glossy paper alone being mappropriate in a book from the pen of an ophthalmologist.

CARDIAC ARRHYTHMIAS Clinical Features and Mechanism of the Irregular Heart. By IRVING R ROTH, M D Large Octavo of 210 pages, with 80 illustrations New York, Paul B Hoeber, Inc., 1928 Cloth, \$7.50

The time has come when every physician should know, as a matter of medical culture, what kinds of cardiac irregularity there are, when every practitioner whose sphere of interest is influenced by the integrity of the circulation should be able to distinguish between them

usually, and to know something of their significance. It is not difficult Dr Roth's book presents a collection of diagrams which makes the matter very plain. They are a somewhat modified variety of those used by Mackenzie many years ago They are correlated to electrocardiographic, venous, arterial and sound wave curves in such a manner as to make those somewhat formidable appearing graphs quite easily read. For those who are interested this offers an excellent opportunity to become familiar with the graphic methods of studying the heart. More important, however, is the lesson on how to recognize the arrhythmias with the finger and the car

The text is short and unusually clear, except in that part of the description of the circus movement, which undertakes to explain why the auricles fibrillate in auricular fibrillation. The book is a beautiful example of book making

FIGHTERS OF FATE. A Story of Men and Women Who Have Achieved Greatly Despite the Handicaps of the Great White Plague. By J ARTHUR MYERS 12mo of 318 pages Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$3 00

In this book Dr Myers has given us a most interesting biographical account of many of the world's most famous sufferers from Clinical Pulmonary Tuberculosis. He has combed history from the time of St. Francis of Assisi down to the late Christopher Mathewson and to the present Eugene O'Neill

These biographical sketches are not presented from the modern subjective or psycho-analytic method of approach, but rather as ordinary developmental, chronological, expositions

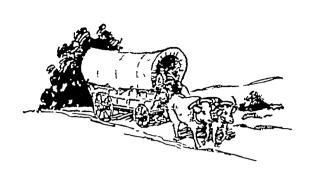

A few of the interesting personalities described are,—Elizabeth B Browning, Frederic Chopin, Johann Frederic Schiller, John Keats, Eugene O'Neill, Cecil John Rhodes, Fedor Dostoievsky

FOSTER MURRAY

CRAWFORD W LONG AND THE DISCOVERY OF ETHER ANESTHESIA By FRANCES LONG TAYLOR. Octavo of 237 pages New York, Paul B Hoeber, Inc., 1928 Cloth, \$400

Dr Long's daughter has performed a loving task. Her endeavor evidently has been to make sure that her father's memory is kept green, and that his claim to have been the first successful user of ether for surgical anesthesia is properly recognized by his colleagues. If this latter were the only valid reason for the book it would be proper to give it a place in libraries, for although the claims of all concerned in the introduction of ether had already been pretty well allocated, Long now with the others has his place on the shelves. The interwoven narrative of the times of the '40s as lived in the southern fringes of the United States gives a liveliness to our appreciation of the circumstances which obscured for a number of years the introduction of that outstanding event which has been so potent a factor in the evolution of operative procedures

Fortunately there is not much space devoted to disputation and criticism of others. The acrimony which marked the earlier strife for place and prestige is hap-pily buried with the dead, and Mrs Taylor's story is a happy continuation of the charming and genial expression of a simple and unpretentious life. We do well to notice Long's unselfishness in these egoistic days, and may ponder with profit this unpretentious biography of a sincere and successful doctor of some A. F ERDMANN decades ago

You Are Not Pioneering When You Prescribe

DRYCO

for Infant Feeding

- 1. Years of international clinical history have established its merit.
- 2. Current medical literature bears frequent reference to its efficacy.
- 3. Thousands of physicians know from experience that it can be depended upon for good results.

There is as great a difference between Dryco and ordinary dried milk as there is between certified and other liquid milk. The results obtained with the use of Dryco have made it an incontrovertible fact that Dryco is ideal for infants deprived of breast milk and is of especial value in difficult feeding cases.

LET US SEND SAMPLES, SUGGESTED FEEDING TABLES AND DATA!

For convenience, pin this to your Rx. blank and mail now

THE DRY MILK CO. PARK ROW, NEW YORK, N. Y.

OUR NEIGHBORS

THE COUNTRY DOCTOR IN MISSOURI

The problem of rural medical service is universal throughout the United States It was the subject of an address at the 71st annual meeting of the Missouri State Medical Association by Dr F I Ridge, President-elect The following extracts from his address are taken from the September issue of the Journal of the Missouri State Medical Association

"The need is not so much one of educating and graduating more doctors as it is the need for intensively educating the public in the rural communities to appreciate the doctors they have in their own locality. The young man does not locate in the smaller towns because the people will not support the young phy-

"At the present time there is no such animal as the young country doctor The apprentice system of medical education is a system of the dim past Today medical education is almost universally standardized and regulated There are required so many years of preliminary education, four years of medical education. so many hours of this and that specialty and a year of practical experience and rigid super-The 'Urban Henry' is no better equipped than the 'Rural Henry' Some of them on completion of their education and training, having a little more sense and a better perspective than others, attempt to locate in the rural districts They are interested only in their profession and are prideful of their call-It is from these that we recruit our

great doctors-our Oslers, McKenzies and

They grow in medicine and do not

shrink into specialization, but are specialists in medicine I am frequently asked by people, 'Doctor, what is your specialty' and I invariably answer 'The skin and its contents'

"I think the chief reason why younger doctors do not locate in rural communities is simply because the rural people will not and do not support good doctors—except veterinarians. They think and reason that any young man who comes back to the country either can't make good in the city or else is just a fool. Such is not the truth. There are many good men in the cities today who moved from the country, were born in the country, raised in the country, love the country want to live in the country, but the country will not support their own

"The number of doctors in the rural communities has decreased five per cent in the last seven years, and the population has decreased in these same communities fifteen per cent. So it is not that there are too few doctors to supply the rural communities, it is the failure of the ruralites to appreciate and supply the doctor. Any community can have any kind of a doctor it wants. It can make its doctor as high class as it wants and it can demand the best, if it wants hard enough to support the best.

"No well trained, intelligent country boy is going to start in his home town when he can build a larger practice by having his home town people come to the city to consult him 'A prophet in his own country'"

ANNUAL MEETING OF THE MEDICAL SOCIETY OF NEW JERSEY

The minutes of the Annual Meetings of the Medical Societies of sister states are of interest to physicians of New York State, for they show how the other states manage the problems which confront New York. The minutes of the meeting of the House of Delegates, which was held on June 6 to 8, 1928, are published as a supplement to the August issue of the Journal of the Medical Society of New Jersey. The following extracts will be of special value to New York physicians.

Dr M W Reddan, Chairman of the Committee on Arrangements, said "Practically all of our exhibits space is sold Our gross income this year will be about \$1,800 from the exhibitors and from the ads in the program This money goes

somewhat like this The ladies' night will cost us \$150, the dance and entertainment on Friday night will cost \$250, the wheel chairs will probably cost \$250, card party, \$100, signs and painting about \$25, setting up the exhibition tables, cards and so on, \$125, entertainment of such guests as may be coming to the society, about \$75. That will leave about \$350 net for the society. I notice that is a little improvement over last year.

"We have excellent feeling between the exhibitors and this society. We feel that they are men of high type, making their living selling to us the things that we sell to our patients. We try to have a reciprocal relation between them

(Continued on page 1193-adv xix)

(Continued from page 1190)

We are told, and I don't think it is hot air, that they are better treated at our convention than almost any convention they go to I want you all to go to their exhibits and sign up with every man. It isn't asking much of you, it is giving a great deal of support to your committee and helps to bring the exhibitor back each year and does the society a great deal of good."

Dr Charles D Bennett, reporting on the JOURNAL, gave a report on its finances, and among

the items were the following

Advertising secured by the Cooperative Bureau of the A M A Advertising secured locally	\$ 3,589 40 4,530 59
Total advertising	\$ 8,119 99
Other receipts	896 43
Total receipts Printing and mailing Journal Other expenses	\$ 9,016 42 \$10,103 71 1,887 22
Total expense	\$11,990 93
Deficit	\$ 2,974 51
Deficit per capita of 2,323 members	1.28

However, the report takes no account of the

expenses of rent and editor's salary, items which would amount to at least \$3,000, and should be considered when comparing the cost of the Journal of New Jersey with that of another state

Dr J B Morrison, Secretary of the State Society, reported that he had received a letter from the American Medical Association asking about "an action taken by the Public Service Corporation in New Jersey, whereby they instructed their men that in every case of accident where an employee of theirs was overcome by gas or asphyxiated by drowning, that man was to be treated by one of their instructed employees by the Schafer prone method of resuscitation, and that no person, not even a doctor, was to be allowed to interfere with that treatment. The treatment was to be kept up until the patient was breathing well, or until rigor mortis has set in "

"The Public Service Corporation sent these cards to all of their offices, all of their places of employment and sent them to the hospitals in the state. That was about 2 years ago. Since that time, several other public service corporations have taken up the same thing. They have found, as we have found, that the treatment for resuscitation by pulmotors is a bad thing, and they are carrying out the Schafer prone method,

(Continued on page 1194—adv xx)

KLIM vs. Boiled Milk

KLIM Powdered Whole Milk possesses all the favorable attributes of boiled milk for infant feeding yet has none of its objectionable characteristics.

It is safe, due to the absence of pathogens, yet not sterile Its curd is soft and friable Furthermoré it has at no stage in its making been subjected to temperatures higher than that of pasteurization (145 degrees F)

Klim, therefore, is as safe and as digestible as boiled milk and as it has not been oxidized, is the biological equal of raw milk.

It is more convenient for the mother to use, is more uniform, and may be taken on trips or fed under any circumstances or conditions

Literature and Samples sent on Request

MERRELL-SOULE CO, INC., 350 Madison Ave, New York, N Y

Merrell-Soule Poudered Milk Products are packed to keep indefinitely Therefore, trade packages need no expiration date

In addition to KLIM Merrell-Soule offers

POWDERED PROTEIN MILK

This is the dehydrated equivalent of Finkelstein soriginal Eiweissmilch Sustained pediatric recognition and approval testify to the fact that Merrell Soule Powdered Protein Milk has a definite place in infant feeding

POWDERED WHOLE LACTIC ACID MILK

This is correct in composition and acidity preserving all the qualities of a hospital formula. It is easily prepared in the home and is a demonstrated clinical success.

(Recognizing the importance of scientific control, all contact with the lasty is predicated on the policy that KLIM and its allied products be used in infant feeding only according to a physician s formula.)

Coax the convalescent's appetite with tempting, health-building dishes made from KNOX SPARKLING GELATINE

Because of its easy digestibility and protein value, Knox Sparkling Gelatine has been given a high dietetic position, particularly in the regimens of convalescents, the gastro-enterically delicate, and of anorexic patients. As a vehicle for fresh fruits and vegetables, eggs, milk, and in jellied meat preparations, Knox Sparkling Gelatine permits a number of variations in the prescribed diet—dishes which are both appetizing in appearance and satisfying as to bulk

Knox Sparkling Gelatine is also an important adjuvant in the special protein diets of diabetic patients

In infant feeding, its protective colloidal ability tends to prevent colic, regurgitation, and summer complaint—so often due to imperfect milk digestion . . . Tests by Downey have shown that Knox Sparkling Gelatine increases the available nourishment of the milk mixture by about 23 per cent.

For 40 years Knox Sparkling Gelatine has been manufactured by a concern devoted to the making of this one standard product. It is pure gelatine, unbleached, unflavored,

CAUTION!

All gelatines are not alike. Many have added acid, flavoring and coloring matter. In the form of ready prepared desserts, they contain as high as 85 per cent carbohydrates.

Knox Sparkling Gelatine is a protein in its purest form, particularly suitable where carbohydrates and acids must be avoided It contains more than 80 per cent pure protein (4 calones per gram) and has the same neutrality as milk.

Specify Knox when you prescribe gelatine and you will protect the patient from brands unsuitable for his diet purposes

and unsweetened From raw material to finished product, every stage in its manufacture is conducted under sanitary conditions, and is subject to careful laboratory control

Valuable booklets prepared by dietetic authorities

The booklets listed below demonstrate the value of Knox Sparkling Gelatine in medicine, giving many appetizing recipes for its use in various prescribed diets. These, as well as data on many scientific tests, are available to surgeons, doctors, dieticians, and nurses. Check those you wish and mail us the coupon.

requiring annual registration of physicians in this question came under our consideration of the Welfare Committee was cona poll of the Welfare Committee was con-

ed by mail

""While a majority of the Welfare Committee from the beginning favorably inclined toward Board's proposal, and reports coming from county societies as they met indicated an z'-rwhelming majority giving it endorsement, we that it might be unwise to go before the at least, to secure nimous support of the profession

==The hoped-for harmony did not eventuate. tead, the vehemence of the opponents was = h that we deemed it best to postpone further -, non at the moment and to await advice from

House of Delegates"

Concerning medical defense and indemnity in-

real There were 15 cases reported to the comny for action during the past year, upon which to cost of investigation has been approximately One case was settled without court acin Four cases involving suits for \$1,125,000 the pending. In this connection may be menmed a verdict of \$37,000 which was returned is year against a member of the Medical Sociy of New Jersey, who had no insurance prosimpression in the minds of the committee, of he absolute necessity of more adequate profesnonal liability coverage

"Now insurance can be had up to a limit of \$50,000 for one claim, and \$150,000 for any number of claims during the premium-paying year for the sum of \$35. The increased limits re also applicable to doctors specializing in x-ray and radium treatments at a proportionate increase in premium rate, viz, \$110"

The committee reported 949 members insured sunder the group policy, and 400 members hav-

ing other forms of insurance

Nine pages of the minutes were devoted to changes in the constitution and by-laws

SCIENTIFIC EXHIBIT AT THE INDIANA STATE MEETING

The August 188ue of the Journal of the Indiana State Medical Association contains the following statement regarding the scientific exhibit at

the annual meeting

"For the last few years our State Association has dropped the exhibit feature, with regret to many, but we are pleased to announce that that feature will be resumed and there will be a beginning at the Gary session A feature that has been maugurated and developed by Indiana, and

(Continued from page 1193—adv xix) which is probably the most excellent method that any one can practice, and the profession has ac cepted it as such. But, here is an instance that has a legal aspect. Shall a doctor, called in to take care of an emergency case, take the responsibility of that case when he is not allowed to examine the patient? These men will not per mit a doctor who sees a patient lying prone on his abdomen, having this treatment carried out, to turn that patient over and listen to his heart, will not allow the doctor to make any examination or draw any conclusion as to that man's condition. Under those circumstances, it seems to me, no doctor should take charge of such a case. More than that, there has been consider able criticism of the physicians."

This matter was referred to a special committee which, however, made no report to the House of Delegates

The Secretary also reported the action of the Medical Society of the State of New York, endorsing the eight principles regarding the relations of the medical profession to lay health organizations (See this Journal, May 1, 1928, page 495) These principles were adopted by the House of Delegates of the Medical Society of New Jersey

The New Jersey State Medical Society employs an assistant educational secretary, Mrs Ethel C Taneyhill, who lectures to women's clubs throughout the state During the eight months ending June sixth, she had given 47 health lectures to schools, parent-teacher associations, women's auxiliaries, churches and women's clubs Mrs Taneyhill, in her report, said

"The only discouraging aspect in the whole experience so far is the more or less indifferent attitude of a number of individual physicians toward this phase of preventive medicine that we are preaching Such resistance to team work not only goes far to neutralize our efforts but also prevents those very doctors from reaping the benefit of whatever enthusiasm we may have created on the part of the public for enlisting No one can doubt, however, that their services time will gradually eliminate this single unfavorable factor, for the sound logic of preventive medicine makes a strong appeal to the average individual, and the result will be a growing insistence on the responsibility of physicians for maintaining the physical efficiency of their patients"

Annual registration of physicians was discussed in the report of the Welfare Committee, as fol-

"The sole controversial matter before our committee this year concerned the question referred to us last June by this House—that is whether we should endorse the proposition of the Board

(Continued on page 1195—adv xx1)

(Continued from page 1196-adv xxII)

tee chairmen, and state presidents, was held in the Colonial Room of the Woman's Club

"On Wednesday, June 13, the National Auxiliary convened in the Ballroom of the Automobile Club, at Bloomington Mrs John O McReynolds presided The state delegates were grouped in sections for round table conferences

"Dr Martha Welpton, San Diego, California, the only woman delegate in the House of Delegates of the American Medical Association, delivered an address in which she voiced objection to the bill introduced in Congress by Representative Newton, Minnesota, to take the place of the Sheppard-Towner bill in providing for federal child welfare extension service. The bill asks for an annual appropriation of \$1,000,000, amounting to about \$21,000 from each state annually, to be used in child welfare work, "and other service" A 5 per cent administrative charge is deducted from this, the remainder to be redistributed to the Government officers administering the fund may or may not co-operate with state and municipal health authorities, as they see fit. Lay administration of funds to be spent in work in which only doctors are trained is the chief point of objection to the bill by doctors all over the country In San Diego county, California, last year alone, doctors gave the equivalent of work that could be done by one person working eight hours a day, six days a week for a period of two years, without charge, for patients under the Sheppard-Towner bill A plea was made that auxiliary members do not permit the auxiliary to become the agent for the spread of propaganda

"Dr Lula Hunt Peters, of Los Angeles, California, addressed the auxiliary on the import-

ance of dietary measures

"Dr W S Thayer, the newly elected president of the American Medical Association, urged that the members of the auxiliary be very careful in promoting propaganda for the many different interests attempting to enlist their aid. The auxiliary is capable of wielding great influence and it is most necessary that its force be used in the propagation of enterprises of the proper character.

"Dr Jabez Jackson, retiring president of the American Medical Association, warned the auxiliary to avoid entangling alliances in projects legitimately outside their scope of service. He called attention to the fact that 'the auxiliary is an organization centering about only one profession and should devote its powers to projects vital to the profession and the public it serves' He stated that 'professional jealousy and mutual district 1000.

(Continued from page 1195-adv xi) is of so much value to the medical profession should be continued by our Association'

The minutes of the meeting of the Committee on Publicity, which are printed in the same lour nal, contain the following description of the plan of a scientific exhibit

"The first scientific exhibit at an American Medical Association meeting was made by the late Frank B Wynn, MD, in June, 1897, at the Columbus, Ohio, meeting This exhibit reproduced and enlarged an exhibit previously made at the state meeting of the Indiana Association. The exhibit at the Indiana State Medical Asso ciation had resulted from the accumulation by Dr Wynn of interesting pathological specimens on 'case night' which was held each month by the Indianapolis Medical Society Dr Wynn, with cooperation of the president of the Indiana State Medical Association and the assistance of physicians throughout the state, presented an in-1 teresting exhibit at the American Medical Association meeting consisting of pathological specimens and unusual cases. The exhibit was held in in a vacant store room near the meeting place of the Association So much interest was developed in the exhibit that it was adopted as an annual feature of the American Medical Association meetings and a special committee, of which Dr Wynn was chairman, was appointed There was soon added to the pathological exhibit The name other exhibits of scientific interest of the exhibit was subsequently changed from ? the pathological exhibit to the scientific exhibit i Dr Wynn served as chairman of this exhibit committee for several years when he finally resigned His enthusiasm was so great for this work that Dr W W Keene, president of the American Medical Association, two or three years after the establishment of the exhibit, spoke of Dr Wynn as 'the devoted sponsor of the pathological exhibit'"

NATIONAL WOMAN'S AUXILIARY

The July issues of the Texas State Journal of Medicine describes the recent meeting of the National Woman's Auxiliary as follows

"The Woman's Auxiliary to the American Medical Association met June 11-14, at Minneapolis, Minnesota, with an estimated attendance of about 600 women from all parts of the United States The national auxiliary now has organizations in 30 states and boasts of a membership of 10,000 Forty-two Texas women were registered

"Tuesday, June 12, a meeting of the National Executive Board, composed of officers of the national organization, national commit-

(Continued on page 1197-adv xxiii)

(Continued from page 1198-adv xxx)

within reach of you, and would you be willing to cooperate in securing cases and material for demonstrations? 352 replied in the affirmative and 41 in the negative

"To Question 4 'Do you favor the undertaking?' 353 replied in the affirmative and 40 in the

iegative

"It is particularly interesting to note that of the total number, 249 of the 353 who expressed themselves as favorable to undertaking post-graduate work were from sections of the State outside the four larger cities, this due possibly to the fact that those resident in the centers have free access

to staff meetings of the hospitals, etc

"Beginning with the encouragement of a preclinic day at the meetings of such local organizations as were favorable to the undertaking, particularly by arranging for a preclinic day at the coming meeting of the State Society, the State Society, through a committee, might to advantage act as a sort of bureau in arranging for supplying suitable clinicians for the demonstrations, etc., and in adding to arrange programs, and in correlating such programs with those of the medical institutions. In conformity with the above, the following resolutions were adopted

"1 That the University of Virginia, through its Extension Department, be requested to make a further study as to the needs and desires of the profession of the State from the standpoint of post-graduate or extension work among them, and to aid in formulating plans for meeting the

needs

"2 That the Committee endorses the postgraduate clinics and demonstrations now conducted by the medical schools of the State and urges the members of the Medical Society of Virginia to patronize them

"3 The Committee recommends that the Program Committee of the Society put on post-graduate clinics and demonstrations at its next

annual meeting in Danville"

EYE INFECTION FROM MOUTH SEPSIS

The leading article in the July number of the Journal of the Oklahoma State Medical Association by J R Walker, M D, discusses oral sepsis as a cause of inflammation of the eye The article says

"Eye disease of oral origin is far more common than generally supposed. The ophthalmologist who is careful in searching out his obscure cases will attest that it is surprising to note the number of cases that are associated with and are due to infections within the mouth. We often neglect to examine the teeth as the cause of many of our eye diseases, al

"Dr A T McCormick, Louisville, Kentucky, in an address lauded the work of the auxiliary in the state of Kentucky. He stated that the auxiliary had been indispensable in a campaign against political exploitation of the Kentucky State Board of Health

"Mrs Allen H Bunce, Atlanta, Georgia, president-elect for the past year, was installed in office by Mrs John O McReynolds, of

Dallas, retiring national president

"Thursday, June 14, was the last day of the business sessions and the auxiliary convened at the Lafayette Club in the afternoon

"Mrs John O McReynolds announced that the Missouri State Auxiliary had been awarded the \$100 prize for securing the largest number of subscriptions to Hygera between the dates of May 1, 1927, and May 1, 1928 Cass County Auxiliary, Missouri, was awarded the \$50 prize for the county auxiliary obtaining the largest number of subscriptions during the past Both prizes had been offered by Mrs McReynolds, and were accepted by Mrs W Bickford, president of the Missouri Auxiliary McReynolds also announced that an anonymous friend of hers has advanced a prize for the first state sending in 1,000 subscriptions for Hygeia after September 1, 1928 The winner will have the choice of a European trip or an automobile"

POSTGRADUATE INSTRUCTION IN VIRGINIA

Dr J W Preston in the "President's Page" of the July issue of the Virginia Medical Monthly, discusses postgraduate education and summarizes a questionnaire sent by a committee of the Virginia State Medical Society The President says

"To Question I 'Do you believe that some such plan as suggested if put into execution would be of service to you?" 330 replied in the affirma-

tive, and 63 in the negative

"To Question 2 'As a beginning would you prefer (a) that a trial be made of arranging a College Extension Course after the usual plan of one or more lectures or demonstrations weekly, extending over a given period, of ten or twelve weeks, or, (b) that a trial be made of clinical demonstrations, etc, by a teacher or teachers of recognized ability, given through half day or day periods in conjunction with the meetings of your local organization?' 118 replies favored college extension courses and 253 favored instruction given as clinics, etc., in connection with the work of local organizations

"To Question 3 'Would you be willing to make an especial effort to attend clinics given

(Continued on page 1199-adv xxv)

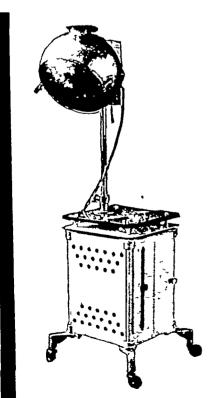

(Continued from page 2000-adv xxvi) purposes and aims of the Association was, however, one resolution which it seems worth while to comment upon more than briefly This resolution referred to the very large number of medical meetings which are held in the larger communities where there are considerable numbers of hospitals. As a result of the agitation in the American College of -Surgeons these hospitals have felt it necessary to hold at regular intervals staff meetings at which scientific programs were presented. It was felt by the House of Delegates of the As-"sociation that these staff meetings did much 'to detract from the meetings of organized medicine They are held at frequent intervals, they zare not open to the general medical public, cand they are essentially local. It is felt that members of the staffs of the hospitals, spending considerable number of evenings a month at these meetings, neglect to attend the regular meetings of organized medicine. By their absence they take away an important element of the Society, they weaken scientific programs, and they are not able to enter whole-heartedly into the duties which an active organization requires of its members In addition to the factor of requiring too much time, it was felt by the delegates that it was not consistent with the purposes of the American Medical Association for its members to be obliged at the virtual command of an organization which comes in contact with only a small fraction of the medical profession to be subservient to the orders issued by this particular organization Lastly, it was felt that the American Medical Association itself should make a thorough study of hospitals and prepare a list of acceptable hospitals"

Address

(Continued from page 1199-adv xxv) though it has long been known that suppurative processes of dental origin are frequently the cause of inflammatory eye diseases

"It would seem from literature that no part of the eye is immune to disease of oral origin We may have ulcer of the cornea, keratitis, irido-cyclitis, retinitis, choroiditis, detachment of the retina, neuritis, episcleritis, abscess of the lids, orbital cellulitis or in fact every tissue of the eye may be involved, although by far the greater number of cases show the iris, ciliary body, choroid or conjunctiva to be af-These diseases may occur in either acute or chronic form

"It is our duty in all obscure eye cases to examine the teeth In doing this we will find one of three things We will find teeth that are plainly pathological, we will find teeth that are plainly normal, or we will find teeth that are doubtful The plainly pathological cases and the doubtful ones should be referred to a dentist with request for a complete examination and pictures made not only of the teeth manifestly diseased, but of all the teeth, for sometimes we will find abscessed teeth that were not suspected"

The author quotes two cases The first was a woman with chronic uveitis and iritis whose teeth had been removed She failed to respond to treatment until the removal of an infected tooth root, disclosed by x-ray, when the eye condition cleared up

The second case was that of a boy age 14, with choroiditis A number of infected teeth profusely discharging pus, were removed with rapid improvement for a time, followed by a sudden extension of the process into a panophthalmitis, which required the removal of the The author concludes as follows

"We, as specialists, should examine the teeth in all cases of inflammatory eyes and premature presbyopias for a possible and quite prob-

able source of infection"

THE HOSPITAL STAFF MEETING

Something must be wrong with the manner of conducting the staff meetings of many hospitals, if there is justification for the following editorial comment in the July issue of the New Orleans Medical and Surgical Journal It is copied here merely as a matter of news to show what a considerable group of doctors think of a hospital staff meeting -Editor's note

"At the recent meeting of the House of Delegates of the American Medical Association in Minneapolis, numerous resolutions and recommendations were proposed, most of which were voted down as contrary to the

PUBLICITY OF DISCUS-SIONS IN THE AMERICAN MEDICAL ASSOCIATION

The July issue of the Teaas State Journal of Medicine carries a running comment on the recent annual meeting of the American Medical Association concerning, giving publicity to both sides of controversial topics discussed in the House of Delegates, the Journal comments wisely as follows

"Dr Warnshuis made the suggestion also that the proceedings of the House of Delegates as published should contain more of the verbatim discussion than has heretofore been the case, in order that the profession generally may know not only what the conclusions were but how they were reached, which is an important matter in many in-The Reference Comstances mittee felt, however, and the house supported it, that the present plan provides sufficient evil unto the occasion, and there will be a change in this regard only to the extent that those in charge see fit to make it would not fuss about it, but it would seem that sometimes the discussions might well be given This is done to rather fully some extent now, but there is always the difference of opinion as to which should be published and which not, when an editor must decide It is quite true that Secretary West knows this game from start to finish, and we are more willing to trust him than any one we know, but still we think that the freedom with which we publish our own transactions is an advantage to us and doubtless it would be an advantage to the American Medical Association Indeed, we note that in the present proceedings more of the discussion has been given than ever before, if our memory serves us properly"

VITAL STATISTICS AND MOVIES

The August issue of the Long Island Medical Journal contains a description of a medical moving picture written by Dr 14b

Galdston, who says

" 'Beware the Pitfalls' is an eight-minute " mated cartoon statistical motion picture I essence it is an experiment. In accomplish ment we believe it has succeeded in 'humanu ing statistics' In this film an attempt ha been made to take morbidity figures and mor bidity rates and to visualize them in a manice that attracts, convinces, and stimulates to ac It seeks to focus attention on child hood diseases and their ravages. It aims " cause the looker-on to feel that this manuis his own affair, and that he is in duty bound to do something about it The film was made to test 100% on the four cardinal principles of good teaching to arouse curiosity, to en list sympathy, to impart information, and to lead to action

"There is a long winding way in the picture, leading to a castle bright in the distance. The winding way represents the years of youth and adolescence, which the child must cross to reach the castle—healthy adulthood

"In silhouette little children are shown marching on the winding way. Then, the pitfalls appear measles, tuberculosis, accidents etc, etc. Children are shown falling into these pitfalls. Some of the marching little ones reach the castle, but those that have fallen by the way are done forever

"It is a simple fact, simply illustrated Yel there is drama enough therein for even the stout of heart. To give a quantitative view of the matter, bar graphs are shown for each childhood disease. Rates and numbers are given, and a comparative graph of the whole list of diseases ties the items together

"Then comes the call to action Many of these deaths are preventable. Here are the children marching again, the pitfalls can be filled, and the way to healthy adulthood made safe and smooth

"That is the closing observation addressed to the audience 'Modern medicine will help you do it But in the main it is up to you who look on'

"For the specific things to be done to 'fill the pits,' the audience can turn to the speaker, to the available literature or to other sources of information The film 'sensitizes' the onlooker to such information, and that's our greatest need and difficulty

"'Beware the Pitfalls' was an experiment in 'plotless-dramaless' health movies. We believe it a success. We think it can be done We hope others will repeat and improve on

the experiment."

THE MORALS OF MEDICINE

By HARRY R TRICK, MD., FA.CS, BUFFALO, N Y

Inaugural Address as President of the Medical Society of the State of New York

THE measure of morals in medicine is the Golden Rule

This rule should be applied in all our relations to our patients, to our fellow practitioners and to our lay co-workers

Physicians have become burdened with such a variety of activities that they have little or no time for meditation. This is regrettable because we may become so confused by the myriads of little things that we may forget the bigger things,—the moral aspects of our work.

Many of the time-consuming activities are due to the natural increase in the refinements of the practice of medicine and to the increasing demands of the public for instruction regarding public health and preventive medicine. Social, civic, and secular affairs have little or no relation to the clinical practice of medicine, but the sum total of these demands upon our time is staggering.

There have been so many advances made in the practice of medicine during the past two generations, and their application to the needs of the general public have required so much administrative work, that physicians have long since been unable to keep pace with all of the work that is imposed upon them. As a result, increasing amounts of this work have been taken over by volunteer lay organizations and other philan-thropic groups This is quite right and proper These groups can devote themselves to the task without interruption, while the imperative demands of clinical medicine make it almost impossible for the practicing physician to assume anything more than a position for rendering advice and general direction But this position of the physician in the work is becoming untenable

Physicians, by research and clinical experience, have established the laws of health, and should insist on directing their application in every public health movement. It is a moral duty for the medical profession to maintain this attitude

toward public health work because their training and experience fit them for it

The needs of Industry have created a type of practice that was entirely unknown a generation ago. We have not yet found a satisfactory solution of this problem, but the prospects for success have become much brighter since we have conferred with the various interested parties and have applied THE GOLDEN RULE all around

Good roads, the modern rate of transportation, the division of medicine into specialties, the rapid increase in the number of hospital beds, and their utilization by the public, have so changed the atmosphere of medical practice, that it has often been said that "the old family physician is passing out of the picture". We may regret the passing of that picturesque figure most of us have known and loved so well, but the modern physician is adapting himself to his environment, and is generally rendering more efficient service to his patients than did his predecessor.

The various activities and changes just mentioned have produced a maze of economic problems more or less related to the physicians, such as workman's compensation, contract practice, group clinics, public health work, and division of fees, etc. The attempt by the medical profession to solve these problems has required so much time, and has attained such prominence, that the medical profession has been accused of becoming mercenary

Certain individuals may have succumbed to the lure of the dollar, but the profession as a whole is sound and will continue to exemplify the best traditions of the profession

To permit the spread of an impression of commercialism would result in the destruction of the very thing upon which the faith of the public in the medical profession rests

The permanence of any structure is determined by the character of its foundation

The integrity or soundness of any structure is determined by the character of its component parts

services of the physician are not susceptible to the interpretations of the rules of conduct of the merchant. A physician is either true to the trust reposed in him by the patient, or he becomes a most despicable bandit as he filches money from the helpless

The trafficking in the sick, commonly called "division of fees," or "splitting fees," is the canker gnawing at our vitals. The sin lies not in the "division," but in the clandestine character of the transaction. It is a prearranged plan whereby somebody secures an exorbitant fee. The very fact that part, or all, of the transaction is clandestine, is proof enough that those who enter into it realize that it is immoral and so they strive to keep it under cover. In some states the splitting of fees is illegal.

All of our transactions with our patients should be susceptible of itemization. If our patient is satisfied with the various items as presented to him, the division of the fee loses its implication

Since it is a question of morals, it should be explained frequently to the medical students, and perhaps used as a test question for entrance to the medical school, with the idea that if we cannot make the old sinner see the error of his ways, and mend them, we may replace him later

with a young physician of higher ideals

If the division of fees, as generally understood and practiced, should ever receive the sanction of organized medicine, our doom would be sealed, since it would mean the loss of the respect of the public, and would be fatal to the idealism which makes us what we are It would justify state medicine. Every right-thinking man values his reputation above money, and therefore we should bend every effort to eradicate this evil which threatens the fair name of medicine and imperils the reputation of all physicians.

PLACENTA ACCRETA*

By DELBERT L JACKSON, M D, BOSTON, MASS

PLACENTA accreta is a condition in which the placenta and underlying uterine tissues are so intimately united that no line of cleavage exists between the two structures

In this condition which may be complete or partial, the usual methods for delivery of the placenta by the normal route may be impossible and if persisted in, carry great risk of damage to and rupture of the uterus. To this is frequently added shock and hemorrhage resulting fatally to the patient.

In regard to the mortality of this condition, Dr Polak stated in 1924 that he believed a case of his own, and one of Griefwald's were the only

recoveries recorded in the Literature

Pathology —Placenta accreta is now universally conceded to be a Pathological entity characterized by a complete or nearly complete absence or atrophy of the endometrium Thus we have removed the protecting layer of endometrium, the decidua basalis or serotina, into which under normal conditions both the floating and anchoring villae respectively project and fasten themselves The result of this condition is that the uterine musculiature, unprotected by the spongy decidua serotina, is directly invated by the villus processes of the chorion and no cleavage line is present between placenta and uterus Along the muscle border, in proximity to the villi, is to be found the so called membrane of Nitabuch, a dense fibrinoid structure composed largely of necrotic chorionic epithelium Sometimes the villi and also adjoining smooth muscle cells may be involved in the necrotic layer. To sum up the To sum up the Pathology of this condition then we have

(1) Complete or partial lack of decidua sero-

(2) The chorionic villi projected into the muscle wall of the uterus or separated from it only by a broken line of Nitabuch's membrane, through the break of which villi enter the muscle

(3 Thinning of uterine wall resulting from the

preceding conditions

Occurrence —Accreta is by no means a common occurrence For instance, in Dr Polak's experience he has met but four cases in his entire practice, while in his studied series of 6,000 cases, one accreta was found At the Boston Lying-in Hospital in 14,648 cases from 1916-1926 two cases of this type are recorded—approximately one in 7,000 In spite of these figures since placenta accreta may be found involving a widely varying proportion of the placenta surface, I cannot but believe that this condition may be more common than has been previously supposed, and if careful Pathological examination is made in all cases of adherent placenta, many more partial accretal formations may be discovered. This may account for the fact that in the last few months at the Boston Lying-in Hospital we have discovered three cases, which together with a case each, from Dr Frederick C Irving, and Dr Louis Phaneuf, and one of my own private cases, allows me to present seven cases in all cases have all, with the exception of one, been verified pathologically by Dr Frank B Mallory, to whom I am indebted for the lantern slides which I will show later The case without pathological examination was verified by post-mortem intra-uterine examination in which large chunks of placenta still attached to the uterine wall could not be detached and no line of cleavage found.

^{*} Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls, N Y May 10, 1927

The practice of medicine is an established structure of the body politic

The foundation of the practice of medicine is

ıdealısm

Idealism is an essential characteristic of the

physician

The idealism of medicine accounts for the high regard in which medicine has been held by the general public during all the years. It attracts more young people to the work than all other reasons combined, and therein lies a significant thought since youth is the idealistic time of life. The youthful dreams of yesterday become the realities of to-day. The practice of medicine is the exemplar of youth's conception of beneficent service.

We must cultivate idealism for our own sake as well as for the sake of our successors, since it permeates the entire structure of medicine. It is the soul of medicine. Any variation from the highest impersonal motives by any member of the medical profession excites distrust and a loss of prestige for the whole profession in the minds of those we serve

Idealism is an intangible force, but it is the

major influence of our lives

The general public is deeply interested in the work of the physician, not because of curiosity, nor because of a hope of personal profit, but because of a desire to learn the truth, and because of an innate desire to express an idealism that is common to all of us

This eager interest of the public is fostered by the medical profession, but it is at once a

source of gratification and dismay

It is gratifying to the medical profession to have so much willingness and power to help at hand, but the dismay seems to be caused by the mability of the lay mind to understand the rules of conduct that govern the medical profession

The Practice of Medicine is a thing apart "It is an ART, not a science, it is a CALLING, not a trade, it is a PROFESSION, not a business" Therefore, those who practice are subject to rules of conduct rather different from those governing other activities. If we should appropriate their rules we would become something different from what we are, and what we have always been, and would lose one of our most valued possessions.

The most priceless heritage of the medical profession is a record of self-effacing service to mankind. We cannot sacrifice that inheritance for any mess of pottage.

The martyrs in medicine are immortal We are proud of the fact that service similar to theirs is being given to-day, but we realize that all progress in medicine is the net result of much study, research, and experience, often by many different persons, and we are filled with a humility that prevents us from acclaiming ourselves as individuals. That is why we are impatient

with the pretensions of the quack and are doubtful of the sincerity and worth of the advertiser It is immoral and sinful to lay claim to professional skill that our training and experience do not justify. It is almost, if not quite, criminal, thus to jeopardize human life

Who would presume to appraise the services of those earnest workers whose efforts have resulted in the absolute control of so many diseases? It is not humanly possible, and any attempt to do so would impugn the motives of those unselfish souls who have devoted so much time, and effort, and even life itself, for the general good without thought of material gain

In some few instances a grateful government or a generous foundation has voted an honorarium, but that was an afterthought and was not the incentive for the work. That is why a discovery in medicine is not patented by an individual. It is not in keeping with the altruism of medicine. All of us enjoy the benefits of every medical discovery as soon as it has been proven

This matter of self-effacement is a difficult one for the layman to understand, but it is writ deep in the hearts of the medical profession, and is essential to secure the greatest good for the greatest number. The work of the research group is paralleled each and every day by those who practice clinical medicine. Every practicing physician devotes a large part of his time and skill to the service of the unfortunate without hope of reward or praise, but he would restrict his charity to the impecunious

Gratuitous service, like gratuitous advice, is not generally appreciated, and it tends to pauperize the recipient. That is why the physician is reluctant about giving his unqualified approval and professional services to certain broad measures of the lay charity group. This explanation of the friction between the medical profession and certain lay organizations is much nearer the truth than the usual explanation of monetary loss to the profession.

To practice medicine as a means of obtaining a livelihood needs no defense, rather does it deserve commendation, since the amount of time, effort and expense incurred to secure the license to practice is out of all proportion to the average monetary returns. But a self-supporting medical profession is the greatest asset of the community, since it makes for independence of thought and action, and is an incentive to keep in touch with medical progress.

If the medical profession should become subsidized or commercialized, it would lose incentive and influence. Occasionally an unscrupulous person gets into the profession who fattens on the misfortunes of others. Such persons are the pirates of medicine. They seduce the thoughtless members of the profession with specious arguments regarding the commercial side of medicine. There is no such thing. The professional treatment and again delivered instrumentally of a still-born baby

In the present pregnancy full term was estimate in June, 1927, but in view of previous eclampsia, a Cæsarean section was performed on March 19, 1927, when patient showed nervous symptoms of imminent convulsions with a B P 190/130 and a L T of albumen

The Placenta was found to be extremely adherent to the uterine wall and particularly so over a large sub-mucous fibroid. The operator found it had to be torn away and could not be removed cleanly. Because of this and the presence of multiple fibroids a hysterectomy was performed. The patient has recovered. Dr. Mallory's report.—S-27-653. "Placenta intimately connected to muscle wall of uterus with little evidence of endometrium. Apparently an example of placenta accreta."

Case 2 Mrs F, 32 years, B L H (Jackson) Patient a para VI Her general past history negative Obstetrical past history consisted of normal delivery at home by the O P D B L H in 1914, 1915, 1917 Two other conceptions since 1917 terminated at two and three months respectively with curettage after the last. In the present pregnancy patient delivered normally by externe Placenta failed to come away and forty minutes later began to bleed. Efforts at Crede failed and the H O sent the case to the Hospital

At entrance, patient showed all signs of extreme hemorrhage Systolic B P-65 Pulse barely perceptible at the wrist. The uterus was well contracted at about level of umbilicus Further efforts at Crede were unavailing transfused of 500 cc. by citrate method and showed improvement. Under G and O, a hand was introduced into the uterus and the placenta was found partially detached with about 1/3 still adherent to posterior wall and fundus This was stripped off with difficulty and extreme care was necessary to prevent going through the uterine On reintroducing an examining hand into the uterus after the removal of the placenta to be sure that rupture had not occurred, a definite crater-like area was found in the fundus where placenta had been torn away This was thought to be a partial accreta

Dr Mallory's report—S-27-779 "Placenta Accreta"

Patient discharged from hospital on fourteenth

CASE 3 Mrs C, 26 years, B L H (Goethals) No 37093 Patient a para 11 First pregnancy terminated normally in O P D, 1925 Present pregnancy uneventful throughout and delivery normal, 7 A M in O P D on March 23, 1927, but placenta failed to detach H O gave pituitrin and attempted Crede without success No evidence of bleeding Uterus firm Patient began to show shock with pallor and pulse

weak at 110 B P reduced to 70 Transferred to hospital at 12 N (6 hours) No external evidence of loss of blood G and O given for manual exploration and placenta found on anterolateral wall of uterus Placenta slowly separated In freeing and pulling down on the final third of placenta, the uterus inverted completely The remaining attached portion of placenta removed externally from uterine wall with scissors. curette and gauze under the eye The inversion of uterus was then easily reduced and uterus packed firmly with gauze Patient immediately transfused and reacted well Pack removed twenty-four hours later and patient discharged on sixteenth day post-partem Dr Mallory's report
—S-27-430 "Shows choronic villi, decidual cells hyaline membrane between villi and uterine wall Placenta Accreta"

Case 4 Mrs D, 23 years, B L H (Irving) No 34595 (Slides shown) Patient a para VII Admitted to hospital December 19, 1925, as emergency after home delivery two hours previous by local physician Her six previous labors had been in seven years, all at term and normal save that patient was sure she bled more at the last one than in former labors, and after-birth was expressed with difficulty On entering hospital, patient in shock, pulse 140, thready Systolic B P was 60 Fundus of uterus hard and contracted at level of umbilicus Active vaginal bleeding Patient transfused with 600 c c citrated blood and this was followed by 1000 cc. of normal saline solution given slowly into vein Dr F C Irving then attempted manual removal of placenta which was densely adherent to posterior aspect of uterus It could not be separated without undue force and danger of tearing the uterus and removal from below was abandoned Supra-vaginal hysterectomy was done. Patient had a temperature of 102 degrees and pulse of 130 with remissions from fourth to tenth days of convalescence when both dropped gradually and patient recovered Discharged on thirty-first day, relieved

Dr Mallory-Diagnosis-"Placenta Accreta"

Mrs G, 34 years, B L H (Kellogg) No 32653 January 12, 1925 This woman a para 1, but had undergone curettage four years previous to pregnancy In eighth month, foetal movement ceased and foetal heart could not be Patient had leaked what was apparently amniotic fluid off and on for two months also showed a large trace of albumin Referred to hospital from O P D Labor was induced with Voorhees' Bag A long drawn out labor ensued Placenta showed no sign of separating Nine hours later attempt at expression failed Manual removal attempted The cervix was shut down firmly and in the process of dilating the lower uterine segment was torn deeply on the right side Placenta was found adherent to the

Corresponding with other cases reported in literature, accreta in this series is found only in multiparas or in cases in which the destruction of the endometrium has been explained by severe intrauterine instrumentation or medication. Dietrich's figures from literature which I quote are as follows in regard to gravida affected. Accreta was met once in Para 2, 4, 6, 10, 11, 12, 14, 16, twice in Para 8 and 9, three times in Para 5, and four times in Para 3

Etiology—In cases of retention a suspicion of the presence of placenta accreta may be gained by the accoucher from the history and examination of the patient, as etiologically the condition is met most commonly in cases where

(a) Manual removal of the placenta has been necessary in one or more previous pregnancies with resulting damage to the decidua

(b) When severe or repeated curettage has been performed

(c) Where medication of a destructive and erosive type or vaporization has been employed in the uterus

(d) In the presence of sub-mucous myomata with subsequent atrophy of the over-lying mucosa

There are also certain cases in which primary atrophy of the endometrium seems to have occurred, and others in which chronic endometritis apparently plays a part in thinning out the mucosa. No signs of acute inflammatory changes have been noted in placenta accreta. Dietrick calls attention to the similarity of conditions existing in placenta accreta and tubal pregnancies. In the latter, we see villa forced through the tubal tissues with subsequent rupture.

Diagnosis — The presence of placenta accreta cannot be diagnosed except as the ordinary procedures for delivery and removal of placenta fail one after the other. The operator eventually has the idea of placenta accreta forced upon him as his final attempt at manual removal of the afterbirth is unavailing and he feels that further efforts will only result in considerable damage or perforation of the thinned uterine wall

Treatment—Any placenta remaining in the contracting uterus two hours or more after birth of the baby without the chinical signs of separation, viz

Bleeding

(2) Descent of cord

(3) Doming of the fundus must be considered as abnormally adherent and a possible placenta accreta. Gentle attempts at Credi may be used, but in complete accreta will be entirely unsuccessful. Forceful crede without signs of placental separation in partial accreta may result in profuse bleeding due to incomplete separation without expulsion of the placenta. Under careful asepsis manual loosening is next attempted, and may be successful where the area of adherence is not great, and the accretal process has not invaded the muscle too extensively

An idea of how far one can pursue this method can be obtained only by using the bi-manual method of examination, viz with the free hand used to give counter pressure over the abdomen In practically all cases a partial separation may be accomplished but with the sensation of the loss of cleavage line or increasing advance into the uterine muscle itself, further attempt at manual loosening should be abandoned. The diagnosis of placenta accreta under the above conditions is undoubtedly confirmed. Any attempt to remove the placenta piecemeal before the entire structure is free from the uterine wall is to be condemned as it will result in

(1) Increased hemorrhage

(2) Possible inversion of the uterus (one of the cases to be described proves this point in spite

of its happy outcome)

If profuse bleeding follows attempts at manual removal of the placenta, tamponade of the uterus may be used temporarily while preparations are made for abdominal hysterectomy. Most cases at this stage will be in an extreme state of shock as a result of fatigue, trauma, and hemorrhage Supportive treatment, by the administration of normal saline by rectum and under pectoral muscle, is advisable in the interval of waiting. If signs of hemorrhage predominate, blood transfusion should precede or accompany abdominal operation. Hysterotomy at the time of adbominal operation for the further attempt at removal of the placenta seems inadvisable to the writer for the following reasons.

 Prolonged operation with increased risk of shock and hemorrhage to a patient already in

poor condition

(2) The small chance of accomplishing removal of the placenta, after a thorough attempt at manual removal has been made from below

(3) The increased probability of uterine sepsis and peritonitis resulting, even if careful aseptic

technique has been used throughout.

(4) The expectation of recurrence of accreta and subsequent repetition of hazard to the patient

in another pregnancy

As a final measure then, when the usual methods of removal of the placenta by the vaginal route have failed, immediate supra-vaginal hysterectomy should be performed

Proceeding along the line of treatment indicated above, I believe that the mortality for placenta accreta can be lowered. In the following seven cases of complete and incomplete placenta accreta, treated by five different obstericians, but two

out of the series died, viz 286 per cent

Case 1 Mrs F, 34 years, B L. H (Kellogg) No 50572 Patient a para 111 During life had been essentially well. No operations Her first pregnancy terminated instrumentally in 1899 and was uneventful. Second pregnancy complicated by eclampsia with convulsion at seven months. She was carried to term under

CASE REPORT BILATERAL SUPPURATIVE MASTOIDITIS WITHOUT PHYSICAL OF MIDDLE EAR OR MASTOID DISEASE*

By BERNARD WELT, MD, BROOKLYN, N Y

In view of the fact that much has been written concerning the occurrence of masked mastoiditis or acute mastoiditis without any local subjective or objective symptoms, I feel that this case report might be of general interest. It is the report of a failure from the point of view of diagnosis and treatment. The child had been treated in the clinics for rickets, marasmus or malnutrition. Nothing in the ears was found to give the clinician any aid. Finally, the severity of the illness necessitated hospitalization, where after a short stormy course it died.

Autopsy did not suggest anything to account for the symptoms. It being my custom to open the mastoids, I discovered rather extensive mastoidal involvement on both sides without middle ear involvement. Microscopic sections were taken and are appended. The tympanic membrane was normal

Case No 360, T H Greenpoint Hospital, male, age 14 months, born U S A

Chief Complaint -

Coughing Duration, 1 week, since Feb 1, '26 Vomiting " 3 days
Dyspnea " 3 days
Fever " 3 days

Marked loss of weight

Family History—Negative, nothing essential

to present illness

Past History—Full term normal spontaneous delivery Feeding for first ten months consisted essentially Nestles food, Grade A milk, orange juice During last four months, farina, vegetables and potatoes were added to the previous articles of diet

Child has never walked or talked Child has never been ill before, has had no operations

Present Illness—Began one week ago with cough and fever which gradually became worse Three days prior to admission the breathing became labored and vomiting occurred. These symptoms also increased in severity. Throughout the illness there was a marked and progressive loss of weight.

Physical Examination —General appearance Male child appears critically ill, has a weak cry, shows dyspnea and cyanosis Groans constantly

and is coughing

Head Frontal and parietal eminences promi-

nent, no craniotabes

Eyes Pupils small and regular, react to light Ears Mastoids negative, canals show no discharge and drums are negative.

Neck No rigidity, cervical glands palpable on

both sides

Mouth Tongue dry and coated, 5 teeth pres-

*Read before the Ear Nose and Throat Section of the Kings County Medical Society May, 1926 Harlem Medical Society ent, mucosa of tonsils and pharynx slightly congested, no Koplik spots, lips cynotic

Chest Heart rapid in rate, moderate beeding of ribs present. Lungs show impaired resonance in right upper lobe and occasional moist rales in right base posteriorly.

Abdomen Negative Skin Dry and inelastic

Extremities Cold and cyanotic, knee jerks

present No Babinski

Laboratory Findings Throat culture negative White blood count, 34200, Diff-pol 92%, SM 6%, LM 2% Red blood count, 4,000,000 Hb 50%

Temperature On admission, 100, varied from 101 to 104, prior to death, 105

Admission February 8th, 1926, at noon Provisional Diagnosis Bronchopneumonia, marasmus and rickets

Working and Final Diagnosis Same Treatment Stimulation, hypodermoclysis Death February 11th, 1926

AUTOPSY FINDINGS

Gross Positive Findings—Body of male infant about 1 year old, poorly nourished and developed Rigor mortis present. No external evidence of injury. Skin pits on pressure

Anterior fontanelle open, circumference 175 inches Brain appears large in size, ventricles contain about 200 c c of straw colored fluid Brain negative on section Mastoids and drum membrane negative to external appearance Left Middle ear free of fluid, mucosa thin gray and shining in appearance. There is no ulceration present Ossicles present and appear nor-The mastoid antrum is plugged with thick pus of yellow color Periosteum and external table of mastoid negative. The mastoid cortex is necrotic and full of thick pus The necrosis extends from the tip upwards to the zygoma and anterior to the antrum Right Shows a similar picture of coalescent mastoid Internal jugular veins, bulbs and sigmoid sinuses normal Smear from mastoids show gram positive diploca

Chest Right lung shows congestion of the middle and lower lobe. There are no areas of consolidation Left lung shows areas of congestion in lower lobe. There is no consolidation

Abdomen Stomach and small intestine show areas of congestion

Microscopical Positive Findings — Lungs Show areas of exudation of polynuclear and round cells into the bronchioles and extension into the adjacent pulmonary alveoli

Spleen Congestion

Liver Shows loss of the columnar arrange-

right lateral wall Large piece of hard infarcted placenta removed Patient showed shock but not enough bleeding present to warrant packing Further removal of placenta abandoned Patient transfused with citrated blood, followed by normal saline solution intravenously. She did not react and died. No autopsy Post-mortem exploration of the uterus revealed large amounts of placental tissue attached to uterine wall which could not be manually separated. This with history seemed to warrant diagnosis of Placenta Accreta

Case 6 Mrs A. S, 38 years, private case (Dr Louis E Phaneuf) January 1, 1926 tient a para 11 History of her first pregnancy (1915) important in that after normal labor she had severe post-partem bleeding a few hours after delivery and also on the third and tenth day post-partem She was packed after the last bleeding and subsequently developed a severe sepsis and thrombo-phlebitis In the present labor delivery complete by forceps to the head which was in sight. (10 lb baby) Uterus contracted well and after one and a half hours attempts at expressing placenta failed Manual exploration of uterus showed a fundal implantation of the placenta extending toward the left wall of the uterus No cleavage line could be made out A small corner of placenta was lifted at the lower pole but was so adherent to uterine musculature that it came away in shreds Further attempts to remove placenta were abandoned and uterus Hysterectomy performed packed with gauze Patient did well for forty-eight hours and then had slight distention On sixth day had acute dilated stomach which was relieved only to recur on the next day and patient became weak and died on the eighth day Diagnosis-Acute dilatation of stomach

Dr Mallory—Pathological examination

"On microscopic examination no trace of uterine mucosa can be found except in two sections through the decidua vera where a few glands are present in the muscle coat. For the most part development of decidual cells is slight to moderate in amount. They occur on the surface of the muscle beneath the hyaline layer of Nitabuch or more often and abundantly between the muscle fibers of the myometrium. Many of them are multinucleated. In numerous places the hyaline layer of Nitabuch is broken through and the villi

are extending into the underlying muscle tissue and into distended veins thus forming a close union between the placenta and the uterus. The unusually close attachment of the placenta to the uterus would seem to be due to three things, to lack of mucosa, to development of decidual cells chiefly within the muscle wall, and to extension of the villi through breaks in the hyaline layer of Nitabuch and into veins lying within it."

Mrs C, 35 years, private case No 1511 Patient a para 11, had (Jackson) bleeding enough to require transfusion after first labor Placenta said to have shown infarct over one-third of its area. In present pregnancy a large baby 10 lbs and 9 oz delivered by forceps applied in mid-pelvis. A half hour after the birth attempt was made to express the placenta from a well contracting uterus. This failed and after another hour and one-half manual extraction of the placenta begun With difficulty, about one-quarter was freed from its attachment to the fundus and posterior wall. As fundus approached distinct thinning of uterine wall was noted and being fearful of uterine perforation the maneuver was stopped Patient had lost considerable blood and showed distinct signs of shock and hemorrhage. Systolic B P was 75 Pulse was 140 500 cc of citrate blood was introduced into the median basilic vein and supra-vaginal hysterectomy by abdominal route was performed as soon as transfusion was completed Patient made an almost uneventful recovery leaving the hospital at end of three weeks

Dr Mallory's Pathological report

"Microscopic examination—no mucosal layer with glands in it can be found There is a moderately thin layer of decidual cells lying within and on the internal surface of the myomet-In places the layer is reduced to almost Between the decidual cells and the chorionic villi is a fairly broad hyaline fibrinoid layer, the so-called layer of Nitabuch In many places it rests directly on the smooth muscle Similar hyaline material is present between and on the surface of many of the villi Calcification is present in places in the hyaline material. In one section the villi pass through an opening in the layer of Nitabuch and show in a blood space in the muscle wall Diagnosis-Placenta accreta"

slight rigidity are sometimes puzzling, especially in children. The rigidity is superficial as is also the tenderness and often this superficial tenderness is manifest if the skin is picked up between the thumb and the index finger. Deep pressure does not aggravate the pain Neck pain may occur from phrenic nerve irritation and the leukocyte count is higher in pneumonia. Rebound tenderness is absent. It must be remembered that both conditions may be concomitant. Tabetic crises and lead colic are two more possible pitfalls. When called to see a patient the cautious surgeon will always be on the defensive and ask himself, is this surely a surgical pathology?

Some cases task the best of diagnosticians hematogenous pyelonephritis is a stumbling The frequent negative urine may mis-The early marked constitutional reaction and the acute flank tenderness outweigh the abdominal signs Renal colic is sometimes a nightmare. I remember being called to see a case of supposed acute intestinal obstruction of 48 hours' duration The obstruction was a reflex ileus and the patient voided a small stone in my presence A more common and tragic mistake is to interpret a gangrenous appendix for renal colic Both begin with severe pain and subside rather suddenly In both, the tenderness may be acute in the right lower quadrant with absence of rigidity Rectal examination and the leukocyte count usually solve the dilemma. In doubtful cases an X-ray is indicated. It should be emphasized that hematuria is absent in half the stone cases

The modest youth in the presence of his family may present a syndrome simulating appendicitis acute pain, tenderness and voluntary rigidity in the right lower quadrant Palpating a little lower, swollen inguinal glands are found and an acutely swollen testicle persuades the surgeon to advise expectant treatment. Acute prostatitis and semina vesiculitis may cause referred abdominal pain Rectal examination has its compensating rewards Lastly a puzzling case may be made more so by the administration of morphia and the application of ice before the surgeon arrives

The most frequent of the Perforative cases is that of the appendix. The typical attack is easily diagnosticated the early reflex parumbilical pain with focal signs in the right lower quadrant after six to twelve hours when the serosa becomes inflamed is a common picture Spreading tenderness and rigidity with acute rectal tenderness completes the classical picture of perforation. This type offers no difficulty in diagnosis, but its treatment tasks to the utmost the skill of the able surgeon. These are not cases for the tiro, the ice bag is better than surgical incompetence.

A grave mistake and often a fatal one is the

unrecognized gangrenous appendix. The pathognomonic feature of the gangrenous appendix is the severity of the pain at the onset (the pain of dying tissue) Later, in eight to twelve hours, when the pain subsides there are only slight focal signs -- slight discomfort -- slight tenderness and almost no rigidity in the right lower quadrant With the occlusion of the appendiceal artery the appendix dies and dead tissue tells no tales and excites no protective peritonitis about it. The patient feels better, the doctor also, and in another few hours the appendix sloughs through and a rapidly spreading peritonitis results, and usually proves fatal Temperature and leukocyte count are notori-A patient with severe abously unreliable dominal pain for several hours, suddenly subsiding with slight focal signs in the right lower quadrant demands immediate operation

The diagnosis of perforated ulcer of the stomach or duodenum can be easily made in The anamnesis of previous indimost cases gestion, the suddenness of onset, the agonizing pain, constant in character in contradistinction to the colicky pain of appendicitis, intestinal obstruction, hepatic or renal colic, the vast extent and degree of board-like rigidity and tenderness so soon after onset, the comparatively slow pulse, slight or afebrile reaction, is a familiar picture A few points are worthy of emphasis, acute embolic ulcers may give no previous history of indigestion up to the moment of perforation, vomiting occurs in less than one half the cases, rectal examination may elicit extreme tenderness soon after perforation from the intestinal contents gravitating into the pelvis The symptom of shock has It occurs soon after been overemphasized perforation and is often transitory More than half the cases show obliteration of liver dullness—a corroborative but in no wise pathognomonic sign The left shoulder pain sometimes complained of is probably a pneumogastric-spinal-accessory reflex

Cases of perforative ulcer of the stomach or duodenum seen in the first few hours are easy of diagnosis After several hours the extraversated chymous material has had time to gravitate about and the case may be mistaken for perforative appendicitis The ulcer patient's history has a dramatic touch—the moment of perforation is remembered Should a doubt exist, a mid-rectus incision soon clinches the diagnosis A peritoneal cavity full of flocculent exudate with food particles should not be mistaken as coming from a perforative appendix and yet reddened appendices have been removed through an error in diagnosis and the patient allowed to go to his doom

Perforation of a malignancy, usually gastric or sigmoid, may be suspicioned from the age and previous history of loss of weight A very ment of the liver cells They show granular degeneration and also fatty degeneration

Mastoids Sections taken from both right and left sides show a bilateral suppurative mastoiditis

Mambrana Tympani The three layers are well defined The mucosa is intact and shows no inflammatory change. Toward the region of the tympanic ring and antrum the mucosa shows a definite catarrhal inflammatory change as manifested by irregularity of the surface casting the cells and increased activity of the coiled glands with the associated round cell infiltration.

Anatomical Diagnosis -

1 Bilateral Suppurative Mastoiditis

2 Bronchopneumonia

3 Paranchymatous Degeneration of the Liver and Spleen

Comment The cases of atypical mastoiditis reported in the literature all had some indication for operative intervention

First, there are cases similar to those reported by B E Hempstead, in the Annals of Otology, Rhinology and Laryngology, of June, 1926 In these cases, the mastoid findings were positive and the middle ear findings were absent at the time of examination. In these cases the indications for operative intervention were the positive mastoid findings of the positive X-ray findings

Second, there are cases similar to those reported by Marriot and Floyd. In these cases, occurring in infants, there were no mastoid signs. There were, however, positive middle ear disease and associated symptoms of dehydration, marked loss of weight and diarrhea. Here the operative indication was the presence of middle ear suppuration and the associated symptoms which indicated sepsis.

This case is of unusual interest on account of the total absence of symptoms referable to the mastoid or middle ear, which might have served

as an indication for operation

ACUTE ABDOMINAL TRAGEDIES*

By EDWARD C BRENNER, MD, FACS, NEW YORK, N Y

ACUTE abdominal tragedies" designates those acute pathologies within the abdomen which terminate fatally unless surgically relieved. Their early recognition depends upon the diagnostic acumen of the general practitioner, for the surgeon is seldom first consulted except in cases of traumatic origin. Since prompt diagnosis and immediate surgical intervention is imperative, the responsibility of the physician is a grave one

It is incumbent upon the surgeon to make an accurate diagnosis if possible and not content himself with the general diagnosis of an acute abdomen Correct pre-operative diagnosis permits of proper incision and approach, saves time and unnecessary trauma, and is imperative if local anesthesia is employed

For practical purposes, "acute abdominal tragedies" may be divided into two groups, (a) the Perforative and (b) the Thrombotic The Perforative group includes the lesions (either from disease or trauma) of the hollow viscera, viz stomach, duodenum, small and large gut, appendix and gall-bladder The Thrombotic group includes those pathologies in which circulatory interference predominates acute intestinal obstruction, volvulus, intussusception, mesenteric thrombosis, gangrenous appendicitis, acute pancreatitis, tumors solid or cystic, with twisted pedicles, et cetera

It becomes at once evident that in the Perforative groups the clinical picture is one of

*Read before the New York Physicians Association at the New York Academy of Medicine, May 23, 1928.

peritoneal insult from escaped visceral contents. The early condition is a focal one, later peritonitis supervenes. The pain is sudden, continuous, first of localized peritoneal irritation, later passing on to true peritonitis. The patient lies still, with updrawn knees, afraid to move, in fact to even breathe deeply. In contrast, in the Thrombotis group, the pain is due to extravarsated blood—it is the pain of dying tissue, colicky in type, the patient is restless and tosses about. Later peritonitis may ensue from gangrene with perforation

Before discussing these pathologies it seems fitting to emphasize some of the commoner nonsurgical conditions with which the surgeon is A few weeks ago I was called confronted in to see the father of Dr J W The patient, 55 years, had been ill thirty hours with epigastric distress and vomiting. The tentative diagnosis was acute cholecystitis amination the patient had slight fever, pulse The epigastrium was 120, respiration 26 The stethoscope acutely tender but not rigid revealed a pericardial friction rub pensated myocardium with an enlarged tender liver is a more common error Angina pectoris, especially the first attack, is sometimes puzzling, with its acute epigastric and occasionally lower abdominal pain Heart cases are usually found in a chair or sitting up in bed Those with abdominal lesions lie down

Early pleural pneumonias with absent or slight chest signs and right sided pain with

and holds its breath, the later passage of currant jelly-like mucous, per rectum, is a familiar syndrome A sausage shaped tumor, usually in the right upper quadrant or epigastrium, is palpated in about half the cases What is worthy of emphasis however, is the free interral between attacks of pain time ago, I demonstrated a chubby baby to a group of matriculates to emphasize this point. The baby was lying on the examining table, playing with its rattle and apparently perfectly About every ten minutes it would cry in pain, hold its breath, draw up its knees and grow pale Such paroxysms would last a half minute and again the baby was ready for its What a deceptive picture in between attacks! After two such demonstrations of intermittent pain followed by free intervals of apparent normalcy, the infant was taken to the operating room and a six inch intussusception (Another instance when rectal examination brought its reward)

Acute pancreatitis usually occurs in portly individuals past middle life and often after eating a hearty meal The onset is sudden with terrific epigastric pain usually passing through to the back-this back pain is often intense. There is pronounced shock, repeated vomiting and a rapid thready pulse. Early distention follows with only slight epigastric ten-The characteristic derness and no rigidity thing about pancreatitis is the excruciating pain, marked collapse and paucity of abdominal The diagnosis is generally a tentative one but, once the abdomen is open, bloody fluid and areas of fat necrosis in the omentum and mesentery confirm the diagnosis

Thrombosis and Embolism of the mesenteric vessels most frequently follows some surgical intervention for infection within the abdomen, especially appendiceal abscess. In this type of case there is sudden onset of acute pain, severe, colicky and remittent in character. At first there is bowel stasis, later, blood

in the vomitus, or especially currant jelly-like stools, confirms the diagnosis. The idiopathic type, less common, usually attacks middle aged males who have a predilection for endarteritis. The onset is sudden with severe remittent abdominal colic in the region of the involved bowel with vomiting and localized tenderness. A bloody diarrhoea is very suggestive. Many such cases have prodromal attacks of mesenteric claudication of greater or lesser degree before complete occlusion results.

Cystic or solid tumors of the ovary whose pedicles twist present the picture of sudden onset of very severe pain, remittent in character with greater or lesser constitutional reaction depending upon the amount of extraversated blood. A tender globular mass is found per vaginum. In adults the pathology is usually ovarian cystoma, in children, ovarian dermoid, sarcoma or teratoma.

The typical case of tubal rupture or tubal abortion offers no difficulty in diagnosis. The atypical cases, especially those of repeated small hemorrhages often mislead. It is well to remember that a married woman whose periods have been regular and who passes her time and has severe pelvic pain is probably either miscarrying per vaginum or per abdominalis. Very acute tenderness in the cul-de-sac with or without fulness connotes a ruptured ectopic pregnancy.

In the foregoing very brief reference to each pathology, an attempt was made to differentiate the Perforative from the Embolic type of lesions and to emphasize salient diagnostic points. A correct pre-operative diagnosis can usually be made but at times this is impossible and the surgeon can only prognosticate the lesion "on the doctrine of chances." Fortunately such cases represent a small minority. Prompt recognition of the acute abdomen with surgical intervention in the first twelve hours usually results in recovery. Thereafter the mortality rises with each succeeding hour.

POLIOMYELITIS

Study of 46 Cases During the Fall of 1927

By ORMAN C PERKINS, M.D., FACP, BROOKLYN, N Y
From the Department of Neurology Long Island College Hospital

HE investigation reported in this article was stimulated by the large number of cases of poliomyelitis in which cranial nerve palsies were present. Although Medin called attention to the fact that the cranial nerves might be involved, the frequency of cranial nerve affection has varied in the different epidemics. In the Swedish epidemic of 1905, in which there were 685 cases studied,

Wickman (1) saw 42 instances of combined spinal and bulbar paralysis. In the series of 71 cases studied by Peabody, Draper and Dochez (2) there were twelve of combined paralysis. In 338 cases at the Queensboro Hospital, in the New York epidemic of 1916 (3), there was cranial nerve involvement in 46 cases. Walsh (4) noted 8 cases of the bulbar type in a series of 45 cases.

short time ago I was called to see a relative who gave the typical history and physical signs of perforation. He had been excessively alcoholic and a gastric ulcer seemed to be the most probable offender. Three small perforations of a recto-sigmoid carcinoma were found. The next day the family recalled he had mentioned losing 23 pounds in weight. Diverticulitis may also perforate but is most prone to produce a localized abscess as the leak is usually a slow one. At operation carcinoma may be told by its pathology and by some hypertrophy of the proximal gut

Perforation of the gall bladder is uncommon It usually occurs after several days of acute cholecystitis and may be ushered in by acute pain and shock and the rapid spread of tenderness and rigidity to the right lower quadrant and pelvis as revealed by rectal or vaginal examination. Slow perforations are usually walled off and are discovered at operation. I have seen the whole abdomen, especially the right side, acutely tender and rigid from an unruptured gall bladder. The diagnosis of rupture in the typical case is not difficult, in the

atypical it may be impossible

In all perforations of a hollow viscus, the process is a sudden focal soiling of the peritoneum which spreads and finally involves the entire greater sac. Therefore it will be at once evident that a proper pre-operative diagnosis is necessary to establish the site of attack. To open the abdomen in the wrong quadrant is to invite the spread of infection and results in a difficult or impossible approach to the site of lesion. In the Thrombotic cases the danger of spreading the infection is very inconsequential.

Traumatic perforations of hollow viscera for practical purposes fall into two main classes, the run over cases and the gun shot wounds. The run over cases are often very puzzling due to the fact that intra-abdominal bleeding so frequently complicates the picture. In all suspicious cases an exploration is indicated, often with an accompanying transfusion. Frequently the skin abrasion indicates the site for incision. Gun shot wounds of the abdomen should be immediately explored unless it can be proven that the projectile followed only a mural course.

The most common of the Thrombotic lesions is gangrenous appendicitis already touched upon. Next in frequency is acute intestinal obstruction. The clinical picture of this pathology depends upon two factors. (1) and of less import, obstruction to the fecal stream (2) and of greater importance, obstruction to the circulation in the gut wall resulting in thrombosis and extraversation of blood. The early symptoms depend upon this circulatory disturbance, namely, colicky pain, in-

creased peristalsis and reflex vomiting. With this triad of symptoms there is no rigidity and no acute tenderness. In the average early case of obstruction the constitutional reaction is akin to that of blood extraversation as in tubal, hemorrhage or post-operative tissue death, namely, temperature 101° to 102°, pulse 100-110 and leukocytosis about 10,000 to 13,000. If much tissue damage occurs shock is produced. The toxaemia has a two-fold origin (1) from the intestinal contents per se and (2) from toxins produced in the intestinal wall from circulatory disturbance. The higher the obstruction the internal contents.

tion the more virulent is the toxin

The operative mortality of acute obstruction is appalling, about 90% This tragic rate is due in large part to delayed diagnosis surgeon is seldom called during the first 24 hours and often not until the third day most cases the diagnosis is self evident—to wit a patient for years has had a reducible hernia Suddenly he is seized with pain and vomiting and the hernia does not reduce Perhaps at the onset his bowels moved once Thereafter nothing passes and enemata return without gas or feces-the diagnosis is clinched Another common case is the patient who has had a previous laporotomy, especially for adnexal Perhaps there has been some indigestion and constipation Suddenly the patient is seized with colicky pains and vomiting and the bowels refuse to move to catharsis or enemeta-the diagnosis is acute obstruction from bands or kinks Another common typepatients usually past middle life who have lost some weight and been a bit constipated, suddenly have pain, vomiting and inability to move the bowels—the diagnosis of acute obstruction from an annular carcinoma is usually verified at operation. A young adult previously laporotomized is suddenly seized with cramps and vomiting and is unable to move the bowels His family physician finds a moderately tender mass on the right side-when the surgeon arrives, the mass is found on the left side—a shifting mass-highly tympanitic-highly presumptive of volvulus In the above types no mention was made of abdominal distention or fecal vomiting. To wait for these is to invite the Reaper. The cardinal sign is inability to move the bowels of feces or gas and this requires but a few hours to determine

The predominating cause of acute intestinal obstruction in young children is intussusception, 75% of these cases occur between the fifth and ninth month, when the lymphoid issue in and about the region of the ileo-cecal valve reaches its maximum hyperplasia. The onset is sudden with colicky pains, usually with vomiting and perhaps a normal stool. The intermittent severe colicky pains, during which the infant pales and draws up its knees.

THE RELATIONSHIP OF ORTHOPAEDICS TO THE PRACTICE OF PEDIATRICS* By CHARLES OGILVY, M D, NEW YORK, N Y

NE hesitates to step from one field of practice to another and suggest or advise treatment of cases in another specialty

The practice of pediatrics, however, is so closely allied and correlated with that of orthopaedic surgery that the two, at times, must necessarily be carried on simultaneously

Pediatrists are consulted more often regarding orthopaedic conditions, especially in younger children, than are we orthopaedic surgeons

Recognizing this fact, I have accepted your invitation to present this paper, and take this opportunity of thanking you for the honor and privilege

The effects of early treatment of acquired deformities in children are so far-reaching that we are astounded in seeing, on the one hand, what brilliant results follow properly directed preventive measures and, on the other hand, the crippling deformities which are the permanent results of carelessly advised or neglected cases

May it be thoroughly understood that the spirit of this paper is one of constructive criticism, offered in the broadest sense of the term, that it may be of practical benefit in the application of orthopaedic principles in your practice of pediatrics. The spirit of the paper is neither to apprehend nor condemn

It is conceded that in the practice of your specialty, the treatment of a difficult case of malnutrition or suspected appendicitis, for example, might be more interesting and absorbing, and invite closer attention and concentration than a case of developing foot deformity, or a beginning spinal postural deformity. The latter may seem insignificant and much less interesting in comparison. Nevertheless, from the standpoint of the child's ultimate efficiency, the orthopaedic condition is often even more important than the pediatric, and your responsibility is as great in the one case as in the other.

The purpose of this short paper is to enable you to be better orthopaedic practitioners while carrying on in pediatrics

As previously stated, the orthopaedic conditions in infancy and childhood are in the majority of cases first brought to the pediatrist for suggestion and advice. It is at this time that you have the opportunity, as well as the responsibility, of planning and carrying out the principles of orthopaedic surgery with a very far-reaching effect. Do not side-step this responsibility.

It is this phase of the subject which I wish especially to emphasize

Congenital deformities or diseased conditions find no place in this discussion

The following cases will serve to illustrate In each instance, the pediatrician was the first to be consulted

I R H—4 years Diagnosis Double weak feet, referred to instrument-maker for plates—type of plates not specified. No further treatment or advice, nor any check-up made. One year later reports that the plates received were never worn as they caused pain and discomfort. Thus one year was lost during which the condition became much worse.

N M—2 years Was advised to raise outer sides of soles for marked in-toeing. Not checked up or seen afterwards and now reports, six months later, with marked eversion and footstrain.

M E—9 years First noticed two years ago that she "ran over" towards the inner side of the foot, especially when wearing slippers. This was reported but no notice taken of it, nor any treatment prescribed. Now there is a well developed condition of flattening feet with accompanying symptoms.

IV B H—6 years Complains of pain in legs due to eversion and foot strain. Had been advised to wear mocassins as long as possible

G W—A years Foot deformities recognized at birth Soles and heels properly elevated when child was one year old and was seen again six months later but not since Now, three and one-half years later, condition of marked weak feet with foot strain for which special shoes and plates are necessary. Three and one-half years of the most important time for treatment having been lost.

B C—2½ years So called "expectant treatment" for double knock-knees one year ago Now braces are necessary as the knock-knee condition has increased with accompanying double eversion of the feet

J G—10 years Antero-posterior postural deformity with a slight lateral deviation. Two years previously was advised being kept out of doors in the fresh air as much as possible, but no further treatment suggested. Now, both exercises and a spinal corrective corset are necessary.

These are but a few of the many cases which are constantly occurring, all of which are readily diagnosed and can be well prescribed for and followed up. Having been diagnosed by the pediatrist, and certainly after having been prescribed for by him, they should be carefully and conscientiously followed up by him to a satisfactory conclusion.

FOOTWEAR In general, sneakers should be condemned It is true that some children can wear sneakers without injury, but about 50%

^{*}Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 23 1928

	Total	42	46

The 46 cases studied in this report were patients admitted to the Kingston Avenue and Long Island College Hospitals in Brooklyn, N Y, during the months of August, September, October and November, 1927 Of the 46 cases studied, 37 were patients in the Kingston Avenue Hospital and 9 in the Long Island College Hospital The onset occurred in 19 cases in August, 15 in September, 8 in October and 4 in November Twenty cases or 43 4% showed cranial nerve involvement

In the study of the results of the investigation of the bulbar type in which the cranial nerve nuclei had been affected, we find that the oculomotor was disturbed in 6 cases, giving rise to partial ophthalmoplegia and inequality of the pupils The abducens was affected in 7 cases, resulting in an internal stra-There was a facial paralysis in 8 cases and in every case the paralysis was unilateral and all three branches were affected Paresis of the laryngeal muscles resulting in a change in the voice, difficulty in deglutition and regurgitation was observed in 10 cases Paralysis of the hypoglossal nerve was marked in one case, the tongue deviating to the right In one case there was a bilateral deafness which was complete and at the time of discharge from the hospital there was no evidence of a return of function of this nerve The spinal accessory was involved in 4 cases

There were three cases in which the cerebral hemispheres and basal ganglia were involved One case, a female, 25 years of age, was stuperous for three weeks and during this time she was disoriented as to time, place and per-She had hallucinations for a period of two weeks and marked delusions for six weeks In this case there was a paresis of the left arm, with an increase of the biceps, triceps and supinator reflexes over those of the right arm. The cell count in the spinal fluid was 1980, five days after the onset of the The second case occurred acute symptoms in a female, 6 years of age. All the deep reflexes were hyperactive and there were marked choreiform movements of the upper extremities The cell count in the spinal fluid on the fifth day after the onset was 90 The third case was an extremely unusual type occurring in a female, 11 years of age. There was a

flacid paresis of the right leg and a spastic paresis of the left arm and leg. The left leg was swollen, cold and cyanosed. The vasomotor instability in the left arm and leg was very pronounced and remained for 16 days, when it completely cleared up. There were 80 cells in the spinal fluid on the fourth day after the onset.

One or more of the extremities were involved in 44 cases. In summarizing the involvement in the extremities, I find the following distribution

Right leg alone	5
Left leg alone	ē
Right arm alone	i
Left arm alone	0
Right and left legs	16
Right and left arms	C
Right leg and right arm	C
Left leg and left arm	2
All extremities	14

In studying the character of onset in this series of cases, there is nothing unusual. The principal symptoms occurred in their order of frequency

Nausea and vomiting	32
Headache	31
Pain in the back	28
Rigidity of the neck	24
Drowsiness	22
Sore Throat	21
Hyperesthesia	2
Photophobia	1

I wish to call attention to the frequency of pain in the back, the so-called "spine test," in this series of cases. The pains in the back may be uncommonly severe and associated with protective rigidity. These pains in the back are probably due to inflammation of the spinal meninges (5)

Four cases were in patients between the ages of 20 to 25. Seven cases were between 10 and 20 years of age and the remaining 35 cases were below the age of ten

The colloidal gold reaction was carried out in 32 cases and the characteristic curve as described by Regan, Litvak and Regan (6) was found in 26 cases

by means of elevating the inner sides of the soles and heels of the shoes. The amount of elevation will necessarily be more than for weak feet only, and will be approximately ½" to ½" It is true that such an elevation of the foot will cause a marked inversion of the foot and a temporary inverting deformity. This, however, is not only not harmful, but it is usually beneficial, as the majority of these cases have an accompanying eversion of the foot, due in part, if not altogether, to the knock-knee condition

The legs should also be massaged every day During the night, a Figure of Eight Bandage should be applied to hold the feet and ankles firmly together. The Figure of Eight Bandage prevents a lateral slipping of the feet and legs. The child very soon becomes accustomed to this corrective bandage application.

BOW-LEGS A beginning bow-legs case should be massaged every day, and a similar Figure of Eight night bandage applied, but applied midway between the knee and the ankle This treatment will prevent many cases of knock-knees and bow-legs from developing into more marked deformity, when braces or operations are necessary

POSTURAL DEFORMITIES It is impossible with such a short time at one's disposal to do justice to this subject. But I wish to emphasize the great importance of recognizing these postural deformities the minute they enter your office. They should be recognized whether or not the patient comes in to consult for this condition Postural deformities are so often overlooked or neglected by parents

An antero-posterior postural deformity is readily diagnosed, the picture is a classical one, and being always associated with prominent scapulae, marked lumbar lordosis, and prominent abdomen. The patient carries himself in a slovenly way. Not only does he not stand up erect, but he sits in a stooping position, slumps over his desk or book, and in general appears to be rather below par.

Having recently examined some five thousand school children between the ages of seven and fourteen, I have found that between 11% and 12% have a postural deformity

This postural deformity at first is not associated with a lateral deviation of the spine. The deformity is only antero-posteriorly. There are no painful symptoms whatever, and the only thing that will call your attention to the condition is the careless, relaxed position held by the patient, both in sitting and standing. With the clothing removed and the patient standing in front of you, the full significance of the deformity is immediately apparent.

Treatment is exceedingly satisfactory Special corrective spinal exercises should be given at least twice a week by a competent instructor

Each day, morning and evening, the patient should spend fifteen minutes to half-an-hour performing these exercises in his own home. The patient should then report to you at least once a month for a check-up and a comparative study made relative to the previous condition when last seen

This deformity is entirely postural, there being no bone change Six month's treatment is usually sufficient to correct the condition

If allowed to progress, a lateral deviation of the spine will develop. This in addition to the antero-posterior postural deformity, naturally increases the amount of apparent deformity to a considerable extent, with a resulting elevation of one shoulder over the other and an apparent enlargement of one hip in comparison to the other

One scapula is seen to be further from the spinous processes than its fellow, and a decided lateral deviation of the spinous processes is noticeable. The antero-posterior postural deformity is somewhat exaggerated at this stage, and the general attitude of altered poise of the body is more marked.

These cases are all curable owing to the fact that bone change has not taken place as yet, provided that rotation of the vertebrae has not developed. When the latter takes place, a perfect cure is not possible because of change in the bony structure of the bodies of the vertebrae, but where a lateral deviation alone exists, and is due only to the postural deformity, both this lateral deviation and the antero-posterior postural deformity can be corrected by exercises in most cases. In others, a spinal brace is necessary in addition to the spinal corrective exercises.

When, in addition to exercises, you have a spinal brace applied, see that it is properly fitted and a real corrective force. Otherwise your patient may be wearing a harmful rather than a beneficial brace.

For these severe forms of lateral deviation without rotation, in which you decide that a spinal support is necessary, a well-fitting, properly made steeled corset will be found to be most satisfactory

You will see in this short résumé how important it is to follow up closely the treatment which you have prescribed, as it is not possible to expect the shoemaker, bracemaker, or instrumentmaker to assume the responsibility of the results of the treatment from the appliance prescribed

The results of your so checking up these cases from time to time will mean the difference between success and failure in the results obtained

In conclusion, I would again emphasize how very much the patient depends upon the pediatrician for the recognition and properly carried out treatment of these acquired deformities in early childhood of our children have a tendency to weak feet, and therefore our camp outfits should prescribe "Strong Sport Shoes" rather than "Sneakers" More foot strain cases in children are reported in September after the summer camps than at any other time during the year. This is very significant

The same applies to gymnasium shoes These should have a very firm base of support

In small children and growing infants, short and pointed stockings have permanently injured many otherwise perfect feet. This applies before the, baby begins to walk as well as later. The same is true of the tight bootee for an infant

When a child begins to walk, a square-toed solid soled shoe should be ordered. The broadest part of a child's foot is across the toes therefore, this should be the widest part of the shoe. The shoe should always be kept longer than the foot

Recently a salesman of children's shoes, when asked how often a discarded shoe was long enough for the foot replied, "Very, very seldom" Unfortunately, most children are allowed to wear their shoes until the toe is driven downwards and forwards, and so traumatizing the foot at each step. This applies specially to younger children

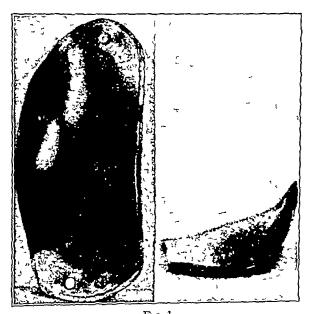

Fig 1
Leather steel inserts inverting the foot

Corset-sided shoes are a delusion and a snare, and can neither prevent nor correct eversion of the foot—which is the primary factor in producing most cases of foot strain and weak feet

Flexible-shanked shoes for weak feet are wrong These cases should always wear stiffshanked shoes FOOT-STRAIN The symptoms of footstrain in children are not those relative to the feet themselves. They are rather those of general fatigue accompanied by over-fatigue. The child refuses to accompany his playmates in their sports and games and the usual childhood activities are cut down to a minimum. Upon examination, the feet are seen to be decidedly everted and, as a natural sequence, foot strain results

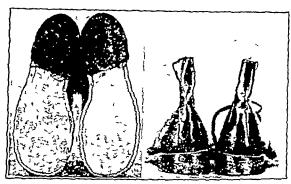

Fig 2
Surgical heels raised 3/16" on inner sides

These cases are treated by inverting the foot by means of a surgical orthopaedic heel, raised approximately $\frac{3}{16}$ " to $\frac{1}{4}$ " on the inner side This, in many cases, is all that is necessary If it should prove insufficient, the reason is that the inversion of the foot is not complete, and this complete inversion of the foot is obtained by means of a small leather arch which you can have constructed by the orthopaedic shoemaker, and which will change the plane of the foot and so obtain a better foot balance by raising its inner side. These inserts with the surgical heel will correct the majority of your cases sionally, with a very heavy child, with an extremely flexible type or joint ligaments, a plate will be necessary In these cases, I recommend the Whitman Plate, in addition to the surgical heel High laced shoes should always be prescribed

Foot exercises are of great importance, and of these, I shall mention two, i.e. walking on the outer sides of the feet, and also rising upon the outer sides of the toes, slowly and rythmically These two exercises should be continued daily night and morning for five minutes

KNOCK-KNEES You will see many cases of slight knock-knees. The "expectant treatment" mentioned in textbooks for these cases means no treatment whatever, and so often results disastrously

A slight knock-knee can be controlled and corrected by changing the body weight thrust from the inner side of the knee joint to the outer

The early diagnosis of gas gangrene is of prime It should always be kept in mind when there is a deep, lacerated or contused wound of the extremity or buttocks, especially when there is a compound fracture, a foreign body, or an impairment of the blood supply If gas gangrene is kept in mind, débridement will be done thoroughly and after care will be more intelligent. Swelling about the wound and intense pain are early and important symptoms The skin is first pale and then mottled Later it is yellow and green with numerous blebs There is a thin discharge. An increase in the pulse rate out of proportion to the increase in temperature is an important sign. The patient is alert though toxic. Gas may be discovered by auscultation and percussion or by the x-ray before bubbles or crepitation are apparent. The odor is characteristic Encasement of plaster should never be made when gas bacillus infection is a possibility The wounds should be left open and frequent inspections made

The surgical treatment of gas gangrene was put on a rational basis during the recent war when careful observation and experiment explained the pathological process. Surgical treatment is supplemented by serotherapy, but serotherapy cannot replace surgical treatment. Van Beuren (8) gives the following general rules for the treatment of gas bacillus infection.

l Operate as early as possible under nitrousoxid anaesthesia, if you can

2 Prepare the part with the least amount of trauma and delay

3 Avoid tourniquets

4 Make incisions longitudinally and one-half again as long as you think they need be both in skin and fascia, but leave as much skin as you dare in your débridement.

5 Go between rather than through normal muscles, but open the wound as thoroughly and as

freely as you possibly can

6 Excise all torn, crushed, discolored, noncontractile muscle until you have left only that which is firm or normal in color, actively contractile, and which bleeds readily

Make a careful search for and remove all loose bone and foreign bodies, especially clothing

and blood clots

8 Stop all bleeding and leave the wound well open and separate its walls with wet gauze, laid in, not packed in

9 Use Carrel tubes, plenty of dressings, and

make careful splint fixation

10 Do all this as rapidly as you can

To these general rules I might add amputate when the toxemia seems to be overwhelming

Bull and Pritchett (9) of the Rockefeller Institute developed a specific serum for Bacillus welchin During the last year of the war polyvalent serum was available largely through the efforts of the French, Weinberg and Séguin (10), Vincent and Stodel (11), Sacquepee (12), and De

Lavergne (13). The infection is usually a mixed one, and therefore, it is important to use polyvalent serum for prophylaxis and for treatment until it is determined what pathogenic anaërobes are present, or in the absence of proper specific ser-The prophylactic dose consists of 30 to 60 cc of the serum injected intramuscularly longer the time that has elapsed since the injury, the larger should be the dose When gas gangrene has already developed, 60 to 100 cc of serum should be given intravenously immediately and the injection repeated every six hours or oftener as the exigencies of the case demand. The serum should be heated to body femperature, an intradermal test should be made; and when the serum is given intravenously, it should be injected very slowly—less than 5 cc. per minute The general and local condition should improve within four or five hours after the injection The polyvalent serum used may be "pooled" serum, or a better serum may be prepared by injecting into the same horse at the same time a mixture of pathogenic anaërobes as done by Vincent and Stodel (11) By comparing statistics it is determined that the use of the serum as a prophylactic measure in the severely wounded lowered the incidence of gas gangrene from 7 to 10 per cent at the beginning of the war to one per cent at the close of the No cases developed when the serum was According to Vincent, serum injected early treatment reduced the mortality from 67 per cent to 15 per cent Ivens in the British Medical Journal (14) reports a series of 433 severely wounded who received polyvalent serum as a preventive measure within the first 24 hours after their in-Some of them already showed early signs of gas gangrene. When the serum was given at or before the first operation, no case died of gas gangrene although 19 died of other causes many cases conservative treatment was made possible by the serum

Under ideal conditions, the following program should be followed as recommended by the Brit-1sh Medical Research Committee (quoted by Barney and Heller (5) If specific anaërobic antiserums of the three important types are available, three gumea pigs should be protected each with two serums in different groupings, and all three of them should be inoculated in the thigh with tissue fluid obtained from the patient Wound exudate should not be used, but tissue fluid should be collected in a sterile syringe. In from 12 to 18 hours an answer of some value concerning the presence or absence of some one or two of the three important types of anaërobes may be formu-Until this report is obtained, or when specific serums are not available, polyvalent serums should be used

All authorities agree that serum should not replace surgery in the treatment of gas gangrene although severe cases have recovered with serum alone as stated by Baldwin and Gilmour (15)

GAS GANGRENE IN CIVIL SURGERY: THE VALUE OF SERUM TREATMENT* By ARTHUR M DICKINSON, M.D., AND CLARENCE A. TRAVER, M.D., ALBANY, N Y

HE preparation of this paper on gas bacillus infection was stimulated by a recent experience with this particular type of infection reful discussion of the subject was thought uable because of the relative infrequency of the ondition in civil life and because of the use of serum treatment Many of us have never seen infection with the gas bacillus in our own prac-Those who were over-seas during the recent war saw many cases One of the authors of this paper while serving with the British Expeditionary Forces in Flanders had the unpleasant experience of seeing the infection develop in many of the recently wounded who could not be evacuated from the forward area because of the mil-The serum treatment, which is itary situation new to many of us and seems to offer a great deal, is the other reason for presenting this paper

In 1853 gas gangrene was first described by Maisonneuve (1) under the name "gangrene foudroyante" Progress has been greatly delayed by a confusion of terms Pasteur described the Vibrion septique, and Koch and Gaffky described the same organism as the Bacillus of malignant In 1891 Welch and Nuttall (2) in this country isolated the Bacillus aërogenes capsulatus, also called the Welch bacillus or Bacillus perfringens, and this organism was found in 77 per cent of a group of war wounds by Séguin and Weinberg (3). Of this series of 91 cases 54 showed more than one anaërobe, leaving 37 in which there was only one anaërobe In 24 cases aërobes were present with the anaërobes Hence, it is important to remember that the infection is usually The important anaërobes accorda muxed one ing to Dayton (4) are the following (given in the order of frequency)

- 1 Bacıllus aerogenes capsulatus (B welchii, B perfringens)
- 2 Vibrion septique of Pasteur (B of malignant cedema)
- 3 Bacillus cedematiens (B bellonensis, B novyi)

Of less importance are B fallax, B sporogenes, and B histolyticus

These organisms require certain conditions to permit their growth in the human body after they have gained entry. The infection is primarily one of muscle tissue. Traumatized tissue with hematoma is the important factor, as this is a common accompaniment of compound fractures, Barney and Heller (5) found gas gangrene more often in compound fractures than in any other type of injury. Other factors are lowered vitality of the patient, hemorrhage, shock, fatigue, damaged blood supply to the part, and contamination

* Read before the Albany County Medical Society on May 15, 1928

with soil, feces, manure, clothing, shell fragments, etc Bullock and Cramer (6) believe calcium from the soil or from a shattered bone has a damaging effect on local resistance to infection and may be an important factor. Gas gangrene may develop in five or six hours and cause death in fifteen hours, or it may not manifest itself for days.

At onset the condition presents the usual picture of a lacerated or contused wound. Some hours later there is local swelling and discoloration of The skin becomes mottled due to the tissues ischemia and then takes on a khaki color or copper-colored bronzing probably due to hemolysis Then there is the typical odor which has not been well described. It has been compared to the odor of a mouse or of decayed meat. All agree that it is foul and penetrating. It remains in the clothing of anyone associated with the patient and is nauseating. The formation of gas is a late symp-Its presence deep in the tissues may be ascertained by the x-ray or by percussion or by auscultation When it becomes superficial, it may be seen bubbling from the wound Palpation will then elicit crepitation The gas, which is composed of carbon dioxide, hydrogen, and nitrogen, exerts considerable pressure in the tissues and is an important factor in extending the infection mechanically by damaging the tissues and so lowering resistance

In muscle the process extends along muscle bundles readily but finds difficulty in passing from one muscle bundle to another unless the blood supply is damaged by the original injury or by the pressure exerted by the gas. The bacteria produce acid which in turn stimulates the growth of more bacteria and the formation of larger amounts of acid. Hence, there is a vicious circle according to Dayton (4). The local acidosis may lower the pH of the blood, and so the blood stream may become a favorable culture medium before or after death. Gas may be formed in the blood.

The final cause of death is toxemia In addition to the toxic substances formed by devitalized tissue there is a hemolysin causing blood destruction and an exotoxin causing ædema and necro-Taylor (7) finds that the gas itself is of little or no importance as a toxic factor, but its mechanical action is probably the most important single factor in determining the pathogenicity of the infection Gas in the tissues brings about the death of the tissues from ischemia, second, the actual mechanical fragmentation of the tissues, especially muscle, and third, the mechanical scattering of the infection. The muscles involved take on a brick-red color which changes to green and They do not bleed on section, and then black they have lost their contractility on stimulation

The early diagnosis of gas gangrene is of prime importance It should always be kept in mind when there is a deep, lacerated or contused wound of the extremity or buttocks, especially when there is a compound fracture, a foreign body, or an impairment of the blood supply If gas gangrene is kept in mind, debridement will be done thoroughly and after care will be more intelligent Swelling about the wound and intense pain are early and important symptoms. The skin is first pale and then mottled Later it is yellow and green with numerous blebs There is a thin discharge. An increase in the pulse rate out of proportion to the increase in temperature is an important sign patient is alert though toxic Gas may be discovered by auscultation and percussion or by the x-ray before bubbles or crepitation are apparent. The odor is characteristic Encasement of plaster should never be made when gas bacillus infection is a possibility The wounds should be left open and frequent inspections made.

The surgical treatment of gas gangrene was put on a rational basis during the recent war when careful observation and experiment explained the pathological process. Surgical treatment is supplemented by serotherapy, but serotherapy cannot replace surgical treatment. Van Beuren (8) gives the following general rules for the treatment of gas bacillus infection.

l Operate as early as possible under nitrousoxid anaesthesia, if you can

2 Prepare the part with the least amount of trauma and delay

3 Avoid tourniquets

4 Make incisions longitudinally and one-half again as long as you think they need be both in skin and fascia, but leave as much skin as you dare in your debridement

5 Go between rather than through normal muscles, but open the wound as thoroughly and as

freely as you possibly can

6 Excise all torn, crushed, discolored, noncontractile muscle until you have left only that which is firm or normal in color, actively contractile, and which bleeds readily

/ Make a careful search for and remove all loose bone and foreign bodies, especially clothing

and blood clots

Stop all bleeding and leave the wound well open and separate its walls with wet gauze, laid in, not packed in

Use Carrel tubes, plenty of dressings, and

make careful splint fixation

10 Do all this as rapidly as you can

To these general rules I might add amputate when

the toxemia seems to be overwhelming

Bull and Pritchett (9) of the Rockefeller Institute developed a specific serum for Bacillus welchii During the last year of the war polyvalent serum was available largely through the efforts of the French, Weinberg and Séguin (10), Vincent and Stodel (11), Sacquepee (12), and De

Lavergne (13) The infection is usually a mixed one, and therefore, it is important to use polyvalent serum for prophylaxis and for treatment until it is determined what pathogenic anaërobes are present, or in the absence of proper specific ser-The prophylactic dose consists of 30 to 60 cc of the serum injected intramuscularly longer the time that has elapsed since the injury, the larger should be the dose When gas gangrene has already developed, 60 to 100 cc of serum should be given intravenously immediately and the injection repeated every six hours or oftener as the exigencies of the case demand. All authorities agree that serum should not replace surgery in the treatment of gas gangrene although severe cases have recovered with serum alone as stated by Baldwin and Gilmour (15)

GAS GANGRENE IN CIVIL SURGERY THE VALUE OF SERUM TREATMENT* By ARTHUR M DICKINSON, M.D., AND CLARENCE A. TRAVER, M.D., ALBANY, N.Y.

HE preparation of this paper on gas bacillus infection was stimulated by a recent experience with this particular type of infection A careful discussion of the subject was thought valuable because of the relative infrequency of the condition in civil life and because of the use of serum treatment Many of us have never seen infection with the gas bacillus in our own prac-Those who were over-seas during the recent war saw many cases One of the authors of this paper while serving with the British Expeditionary Forces in Flanders had the unpleasant experience of seeing the infection develop in many of the recently wounded who could not be evacuated from the forward area because of the military situation The serum treatment, which is new to many of us and seems to offer a great deal, is the other reason for presenting this paper

In 1853 gas gangrene was first described by Maisonneuve (1) under the name "gangrene foudroyante" Progress has been greatly delayed by a confusion of terms Pasteur described the Vibrion septique, and Koch and Gaffky described the same organism as the Bacillus of malignant In 1891 Welch and Nuttall (2) in this country isolated the Bacillus aerogenes capsulatus, also called the Welch bacıllus or Bacıllus perfringens, and this organism was found in 77 per cent of a group of war wounds by Séguin and Weinberg (3) Of this series of 91 cases 54 showed more than one anaërobe, leaving 37 in which there was only one anaërobe In 24 cases aërobes were present with the anaërobes Hence, it is important to remember that the infection is usually a mixed one The important anaërobes according to Dayton (4) are the following (given in the order of frequency)

- 1 Bacillus aerogenes capsulatus (B welchn, B perfringens)
- 2 Vibrion septique of Pasteur (B of malignant œdema)
- 3 Bacillus ædematiens (B bellonensis, B novyi)
 Of less importance are B fallax, B sporogenes,

and B histolyticus

These organisms require certain conditions to permit their growth in the human body after they have gained entry. The infection is primarily one of muscle tissue. Traumatized tissue with hematoma is the important factor, as this is a common accompaniment of compound fractures,

Barney and Heller (5) found gas gangrene more often in compound fractures than in any other type of injury. Other factors are lowered vitality of the patient, hemorrhage, shock, fatigue, damaged blood supply to the part, and contamination

with soil, feces, manure, clothing, shell fragments, etc Bullock and Cramer (6) believe calcium from the soil or from a shattered bone has a damaging effect on local resistance to infection and may be an important factor Gas gangrene may develop in five or six hours and cause death in fifteen hours, or it may not manifest itself for days

At onset the condition presents the usual picture of a lacerated or contused wound Some hours later there is local swelling and discoloration of The skin becomes mottled due to ischemia and then takes on a khaki color or copper-colored bronzing probably due to hemolysis Then there is the typical odor which has not been well described It has been compared to the odor of a mouse or of decayed meat All agree that it is foul and penetrating. It remains in the clothing of anyone associated with the patient and is nauseating The formation of gas is a late symp-Its presence deep in the tissues may be ascertained by the x-ray or by percussion or by auscultation When it becomes superficial, it may be seen bubbling from the wound Palpation will then elicit crepitation. The gas, which is composed of carbon dioxide, hydrogen, and nitrogen, exerts considerable pressure in the tissues and is an important factor in extending the infection mechanically by damaging the tissues and so lowering resistance

In muscle the process extends along muscle bundles readily but finds difficulty in passing from one muscle bundle to another unless the blood supply is damaged by the original injury or by the pressure exerted by the gas. The bacteria produce acid which in turn stimulates the growth of more bacteria and the formation of larger amounts of acid. Hence, there is a vicious circle according to Dayton (4). The local acidosis may lower the pH of the blood, and so the blood stream may become a favorable culture medium before or after death. Gas may be formed in the blood.

The final cause of death is toxemia In addition to the toxic substances formed by devitalized tissue there is a hemolysin causing blood destruction and an exotoxin causing cedema and necro-Taylor (7) finds that the gas itself is of little or no importance as a toxic factor, but its mechanical action is probably the most important single factor in determining the pathogenicity of the infection Gas in the tissues brings about the death of the tissues from ischemia, second, the actual mechanical fragmentation of the tissues, especially muscle, and third, the mechanical scattering of the infection. The muscles involved take on a brick-red color which changes to green and then black They do not bleed on section, and they have lost their contractility on stimulation

due to absorption from dead tissue After amputation the temperature ranged between 100° and 102° with only two rises to 103°. On the eighth day serum sickness developed with urticaria, puritus, and joint pains. The temperature did not reach normal until the fifteenth day of the infection.

It was our opinion that the serum saved the boy's life. Incisions made in the arm and various antiseptics (Dakin's, peroxide of hydrogen, and bichloride of mercury) seemed to have no effect On December 5th, six weeks after the primary amputation, a secondary operation was done removing the humerus which had become sequestrated

Case 2—M S, age 16, admitted to the Albany Hospital on January 24, 1928, at 8 00 P M with a gunshot wound of the right foot. The previous history was irrelevant. The miury to the foot had occurred three hours previous to admission Upon examination there was found a large through and through wound of the tarso-metarsal region The wound of entrance was on the plantar surface of the foot and was relatively small, while the wound on the dorsum was large and explosive in type. The wound was filled with fresh and clotted blood, pieces of clothing, fragments of bone, and many lead shot. The tissues about the wounds showed the usual reaction to trauma X-ray examination showed comminuted fractures of most of the trasal and many of the metatarsal bones with many shot in the tissues The patient's general condition was good

The possibility of development of severe infection or gas gangrene was realized, but the nature of the wound scarcely justified amputation. Accordingly under ether anesthesia, the wound was debrided and all loose and devitalized tissue was removed. The wound was loosely packed with vaseline gauze and Dakin's tubes inserted. No sutures were introduced. A splint was applied to the foot and leg, and 3,000 units of tetanus antitoxin were given.

On the following day the patient appeared somewhat toxic and was semi-delirious wound showed no abnormal signs Dakinization was continued The temperature ranged from 100° to 103° On the next day the patient was quite rational and seemed much better wound was dressed in the morning and nothing abnormal was noted At 5 P M of the same day the dressing was done again, and gas bubbles were seen in the wound There was present no crepitus The leg did not seem to be involved although there was abnormal tenderness along the tibia above the level of the ankle The second and third toes were gangrenous and black, there was a large hematoma on the sole of the foot. The patient's general condition was worse, he was very toxic and irrational During the day the temperature remained at 102° Cultures were taken

from the wound At 9 P M that night, under ether anesthesia, the leg was amputated at a point 5 inches below the knee Drainage tubes were inserted and the flaps loosely sutured 100 cubic centimeters of polyvalent (anaërobic) serum was given intravenously after skin tests. The patient reacted well from the shock of operation January 27th, the next day, the patient appeared much better He was clear mentally and tolerated fluids by mouth. The skin showed some discoloration so the wound was Dakinized Another 100 cc of serum was given subcutaneously. The temperature during the day varied from 98.2 to 100 4°F On January 28th the patient appeared much worse He was delirious part of the time The characteristic odor of gas gangrene was noted in the room There was a gangrenous area about the size of a silver quarter in the anterior skin flap The underlying muscle appeared dark brown and devitalized No gas bubbles were seen, but crepitation could be elicited as far up as the lower border of the patella. The skin on the posterior aspect of the leg was ædematous and discolored All necrotic tissue was removed and the wound left wide open The highest temperature recorded during the day was 996° Two doses of 100 cc each of serum were given subcutaneously On January 29th, the patient appeared better He retained fluids well and was clear mentally The stump was black, and the leg was slightly swollen The dressings had a very foul odor Two more doses of 100 cc each of the polyvalent serum were given during the day On the day following, the patient appeared better still The temperature was normal wound was certainly no worse. No gas could be seen or palpated in the wound or tissues January 31st the patient was much worse again He vomited continually and was irrational wound showed gas formation The thigh as far up as the mid-portion was hard and swollen The temperature rose to 100° On the next day the patient was very bad, he vomited everything, he was irrational, the pulse was feeble. There was little change in the appearance of the wound The patient's condition became worse, and he expired that afternoon

Smears from the wound showed many Gram positive bacilli with large oval subterminal spores, also a Gram negative bacillus with a few Gram positive cocci. Cultures from the wound showed the Vibrion septique and the Bacillus ædematiens. These two organisms, next to the Bacillus welchin are most commonly found in cases of gas gangrene. The amputated leg was examined and smears made. It is interesting to note that no organisms were found in the tissues of the leg above the level of the mid-portion. This fact makes one speculate as to the method of infection of the stump.

Gage states that free incision gives better results than primary amputation in those cases in which the whole limb is not involved. When amputation is necessary, it probably should be of the guillotine type When gas gangrene developes in a segment of a limb distal to the segment wounded, it nearly always means that the main artery is blocked, and amputation is the only course The presence of crepitation is not important when one is determining the course of treatment. It is important that the state of the muscles and the number dead should be ascertained before amputation is performed, otherwise a limb may be sacrificed unnec-Most surgeons recommend a guillotine type of amputation and a Carrel-Dakins type of dressing until smears from the wound show that it is safe to do a secondary closure Fluids should be administered in large quantities and possibly glucose and insulin intravenously to combat shock or transfusion to combat the anemia caused by the hemolysin which is a constant accompaniment of the infection Those who believe in acidosis as an important factor in the toxemia advise two per cent solution of sodium bicarbonate intravenously When the Carrel-Dakins technic is carried out, the possibility of secondary hemorrhage must be The wounds should be left open remembered and packed loosely Permanganate of potash and peroxide of hydrogen are of doubtful value

Smears from the wound are not of much value in making the diagnosis of gas gangrene. Pettit (16) made careful observations of 890 war wounds. Although 478 of them showed anaerobic bacilli, 67 per cent of that number at no time showed clinical evidence of gas infection. He concluded from his studies that streptococci were of little importance in producing the gangrene Brickner and Milch (3), however, disagree with this statement. Septicemia is frequently present (Klose (18) obtained anaërobic organisms from the blood in 60 per cent of a series of 80 cases, and 51 per cent of these recovered.)

In peace times the infection occurs more often with compound fractures than with any other type of wound. The diagnosis is not difficult if the possibility of gas gangrene is kept in mind "All deep wounds, all open and compound fractures of the extremities contaminated by earth, fecal material, manure, etc, demand, especially if they are treated late, the preventive injection of the antigangrenous serum" (Vincent (11))

CASE REPORTS

Case 1—George C, aged ten, was first seen on October 9th about one hour after injury when a fracture of both bones of the right forearm in the middle third was manipulated under general anaesthesia. A small wound (2 cm long) on the ulnar surface of the arm was swabbed with iodine and a sterile dressing applied. The fracture was immobilized with anterior and posterior padded splints and the arm placed in a sling. Circulation

and sensation in the hand were not impaired Antitetanic serum was given (1500 units into the right deltoid). Injury had been sustained in a fall from an apple tree. The bone was not seen to protrude from the wound. The next morning an x-ray examination showed the bones to be in good position. The patient moved his fingers readily. Splints were not too tight.

At 200 p m on the 11th (44 hours after the accident), the patient came to the office complaining of pain in his arm. He felt "sick and chilly" and had no appetite The arm was swollen, and he could not move his fingers The temperature and pulse were each 100 Above the elbow were several erythematous blotches wound itself was not remarkable, but the hand was markedly swollen and cyanotic. The boy was sent at once to the Child's Hospital, splints were removed, and the arm placed in a continuous bichloride soak (1 to 10,000) Gas bacillus infection was considered a possibility, but no blebs were seen and no gas was seen issuing from the wound Crepitation in the tissues was not present Thrombosis and pyogenic infection were also considered Volkmann's ischaemic paralysis did not seem likely because the swelling extended higher than the splints

Early the same evening there was subcutaneous emphysema in the axilla and chest wall, and gas bubbles were milked from the wound by pressure. There were numerous blebs filled with bloody fluid about the wound The arm was cyanotic, almost Culture* Operation did black, below the elbow not seem advisable because of apparent extension into the axilla and chest wall, and because of the Tetanus-perfringens prostration of the patient serum was obtained from the State Department of Health laboratory and given intravenously first injection was 200 cc of tetanus-perfringens antitoxin (Lederle) and was followed after twelve hours by another 100 cc intravenously Polyvalent serum was then obtained from the New York laboratories and injections of 100 cc intravenously were continued every twelve hours until 600 cc. had been given On the sixth day of the infection a line of demarcation had formed three inches below the shoulder, and the arm was amputated through necrotic tissue without any anaes-Maggots were found in the tissues this time 100 cc of the polyvalent serum was given intravenously

The temperature which was 100° on admission, was 105 6° six hours later with a pulse rate of 140. The second day of the infection the temperature again rose to 105 6°. Thereafter the temperature showed a daily swing between 101° and 104 5° for four days. Clinically the patient was improving, and the high fever was thought to be

^{*}Culture showed staphy lococcus albus a Gram negative bacillus giving the fermentation reaction of Bacillus coll and a Gram positive apore bearing anaerobe

GONORRHEAL IRITIS*

By MACY L LERNER, M D, M SC MED, ROCHESTER, N Y

T is not the purpose of this communication to bring forward anything new in the etiology of iritis I am well convinced that every ophthalmologist has in mind the possibility of gonococcal infection when presented with a case of initis of questionable etiology

I merely wish to point out the necessity of painstaking search and study of so-called "recurrent iritis" to prove that many of these cases are not obscure nor idiopathic in their etiology Many of these patients would even retain some questionable teeth in their mouth and even innocent tonsils if we would only begin the search from below first and then go upward

The infection of the genito-urinary tract in the male is unquestionably an important factor in ophthalmology, and every effort should be made to eradicate a possible infection before our attention is focussed to surgery in the mouth or Indeed, often only a very competent urologist can assist us in these problems, because the general practitioner often fails to appreciate how a 16-20 year old gonorrhea, dating perhaps from adolescence, can produce a severe ocular inflammation I have respect for their honest skepticism, but our patient is justified in demanding and receiving the proper treatment.

Some authors maintain that 8% to 20% of all cases of iritis are due to gonorrhea rather high in my experience, nevertheless, it should be borne in mind, considering the high

Read before the Rochester Eye, Ear Nose and Throat

incidence of gonorrheal infection in the male Gonorrheal iritis is never seen during the acute

stage of the urethritis, it may make its appearance some months after the gonorrheal infection or may be delayed for years The importance of eliciting a history of gonorrhea cannot be over-I believe that if ophthalmologists emphasized would question their patients more carefully as to a history of gonorrhea, the percentage of gonorrheal iritis would approach a higher mark than estimated

The iris may be the only portion of the eye involved, but in the more intense cases the uveal tract and even the optic papilla may show signs The infection is endogenous, of inflammation reaching the eye by the blood stream, but whether it is due to the gonococcus toxin or direct action of the gonococcus it has not been determined The gonococcus has only once been isolated from the aqueous humor of the eyes of a patient with gonorrheal septicemia

It should be emphasized that gonorrheal iritis, no matter how stubborn it appeared to be to treatment before a definite etiology is established, is rapidly cured with the appropriate venereal treat-The report of one of my cases will con firm this statement

An English writer reports a case of gonorrheal intis following after a lapse of 16 years after the acute urethritis

This brings up the question of how long the gonococcus can remain active in the posterior genito-urmary organs of the male It is difficult to answer definitely, but it has certainly been discovered after a lapse of 27 years

Discussion Dr Alvah H Traver, Albany, N Y It was my pleasure to see both of these cases just reported, 1 e 1f you might call it a pleasure to see such sad cases for one of these boys died and the other just pulled through I wish to speak especially of the first case for in that case, which really seemed to be the more severe, we did not follow the treatment as given in most Surgeries, and yet that case lived while the other, which received such treatment, died

The first question I would like to consider is this. Has the serum reached that stage of perfection that it should be given as a prophylactic in appropriate severe cases of traumatic injury as anti-tetanic serum is given? It would seem that records from the World War would justify the use of the serum as a prophylactic measure in civil life.

Secondly, if there was any time that this arm could have been amputated early, it was at the time he came into my office forty-four hours after injury, for five hours later the axilla and side of the chest were involved and then surely an amputation could have availed nothing. I would like to ask you the following question. If he had been your son, with a temperature and pulse of 100 and a diagnosis as yet uncertain, would you have consented to a shoulder joint amputation of the right arm? I am pretty certain that I would not have consented had he been my son

Thirdly, since the boy walked into my office at 2 00 p m with a temperature and pulse each of 100 and five hours later the temperature was 105 6°, surely this was a most virulent infection, yet from the time the first injection of serum was given the infection did not spread. What held it? Personally, I think the serum was the thing that saved his life.

In the fourth place, was I justified in treating the arm very conservatively and first amputating through the gangrenous area without an anæsthetic and trusting Nature to form the line of demarkation? I think I was as I feared that if I cut into the borderline tissues I might traumatize them and so spread the infection The fact that I am able to show you this boy to-night, I think, justifies the conservative treatment

The New York State Department of Health showed us every consideration in getting the serum from New York City, and I wish to express my appreciation

We were most fortunate in this case in that we had a nurse who stuck to the case from start to finish even if the odor were such that it took away her appetite and the maggots ran about the bed She was determined to do her part to make him get well and proved that there are young ladies in the nursing profession who still place the welfare of their patients above any personal considerations.

This was a most severe case and caused us

much anxiety yet it was a most pleasing case to treat for both the boy and his parents aided us in every way and never even suggested that we were not doing everything possible for the case

Discussion

Dr Edgar A Vander Veer, Albany, N Y

I had the good fortune, if you can call it that, of seeing the case of the little boy reported by Dr Traver The case of Dr Dickinson's I did not see personally but was consulted in regard to the tractment.

sulted in regard to the treatment

I think there is no question but what the serum used in the first case saved the boy's When I first saw the case, the arm was gangrenous half way above the elbow, and the redness and cedematous condition had extended up to the shoulder joint and all over the right side of the chest. It was remarkable how quickly the large doses of serum seemed to control the infection. The temperature and pulse came down almost immediately, and the deligium seemed to clear up. A very important element in the saving of this boy's life was the prompt amputation of the arm at the line of demarkation, and I believe that is the point where we often times fail in the treatment of these cases The second rise of temperature and pulse in this case was due to the absorption of toxins from the gangrenous arm and not from the original infection. I must confess that I did not see how this boy could survive this amputation, but he has and has made a good recovery as you see by his pres-It is interesting to hear ence here tonight Dr Traver say that he operated without any anæsthetic and without any apparent pain to the boy

I did not see the second case, the one of Dr Dickinson's, but heard more or less about it from the beginning and, with all due respect to Dr Dickinson, I do not think he hit his case hard enough with the serum in the begin Early diagnosis with early large doses of the serum is the only salvation for these cases I have not personally had a case of gas gangrene in many years During the Spanish War, while performing a couple of autopsies, we thought we had come upon some cases of yellow fever for which another doctor and myself were quarantined for a week cultures subsequently showed that they were cases of gas gangrene, and we were released from quarantine much to our relief

I wish to congratulate Dr Clarence Traver upon his interesting and complete presentation of this subject

BIBLIOGRAPHY

1 Quoted by Gage, I M Gas Bacillus Infection, a Frequently Unnoticed Source in Civil Life with a Report of Four Cases Amer Jour of Surg, 1 177-184, (Oct.) 1926

port of the medical examination proved negative findings of the X-ray of his chest and negative Wassermann

The prostatic secretion revealed pus cells and gonococci Patient was referred for treatment to the urologist for the chronic gonorrhea At the same time his eye was treated locally. In one month's time his eye cleared up completely, and when seen last by me his vision was 6/9+1 in right eye, 6/9 in left.

Slit lamp revealed evidence of an old irrits, showing brown irrite pigment on anterior surface of lens. Ophthalmoscopy showed clear fundus details free from pathology. He has not had any attack since

His treatment consisted chiefly of prostatic massage. It is noteworthy to mention that his recurrent iritis would occur about the same time or somewhat later when his joints would become painful. At times the ocular condition would be more aggravated. In spite of such conclusive clinical evidence of his affection, the family physician persisted in treating him for rheumatism.

H M, age 33 Driver, single Ordinary childhood diseases Gonorrhea 8 years ago, lasting five weeks

Ocular History Had attack similar to present one last summer, and cleared up under care of ophthalmologist. Present attack began one week ago, when he felt a sensation of a foreign body in the right eye The following day he suffered severe pain He used argyrol 10%, boric acid, and later was treated by an optometrist with mercurochrome.

When he presented himself to me, his right eye was acutely inflamed Sclera was deeply injected uniformly Globe was very sensitive to touch Cornea somewhat turbid, aqueous cloudy Pupil reacted to light sluggishly

Ophthalmoscopy Showed post synechia Under 1% atropine pupil did not dilate readily, and I had to resort to 2% Pupil finally opened in a pear shaped manner

A more careful history was then attempted by me to satisfy myself whether his old gonorrheal infection of 8 years ago was the underlying factor, and to my surprise he offered conclusive facts by stating that he had a similar attack in his eye a few months after the onset of the gonorrhea

Patient was referred to his physician for complete medical studies. One week later when seen by me I noted that his anterior chamber was filled with a thick plastic exudate. Medical studies revealed suspicion of a tonsillar infection, and the prostatic secretion revealed few pus cells. Prostatic massage and treatment of genito-urinary tract was started by his physician. One month later his eye cleared up. He was free from pain, and the globe was practically white

Tonsillectomy was advised just the same, to re-

move additional focus of infection

Conclusions

 A careful history, not only an ocular one as to previous inflammatory attacks, but also ven-

ereal, is of great importance.

(2) Cooperation of patient, and an earnest attempt should be made to get his confidence in eliciting such confidential history. Very often a patient will not volunteer such information to the ophthalmologist because of his lack of appreciation of the relationship of an ocular affection to a remote sin of his youthful days (especially true in married men)

(3) Careful and repeated examination of the prostatic fluid should be made in patients with a

gonorrheal history

(4) In doubtful cases, it should be treated as possible g c infection when other foci of infection are excluded and tuberculosis definitely excluded

1924

There is one definite clinical characteristic in gonorrheal iritis, and that is that it has a tendency to recur The term "recurrent iritis" is bad. It really means one thing, that the etiology has not been established, or the venereal condition did not get adequate treatment

Every male patient with recurrent iritis should have a thorough investigation of the genito-urinary organs by a competent G U man. The actual attack of iritis due to gonorrhea perhaps differs very little from that produced by other causes except that it may be associated with severer pain. It is of a plastic fibrinous nature, and the exudate may fill up the entire anterior chamber (One of my cases illustrated this point very well) Some authors believe the latter to be pathognomonic of gonorrheal infection

In those eyes in which a recurrence has taken place it is typical of a gonorrheal infection that in the early recurrences very little ocular damage has been done, and only by careful examination can the results of a previous attack be demonstrated. In many cases nothing remains but very few, one or two posterior synechia, and then only seen after dilatation of the pupil

In syphilis the iritis is either a secondary or tertiary manifestation. No recurrences are apt to be present until the tertiary manifestation. It is amenable to antiluetic treatment more easily Definite yellow-red nodules may be present, resembing condylomata of the secondaries or gummatas of tertiaries.

It is mentioned in text books that gonorrheal iritis is always preceded or acompanied by articular pains. This does not seem to be correct because it is estimated that only 2% of all cases of gonorrhea develop this complication.

In order to make a definite diagnosis a careful examination of the genito-urinary organs must be made, and it should be remembered that the absence of discharge from the urethra nor the absence of threads from the urine can exclude the disease. The prostate should be thoroughly expressed and the fluid carefully examined microscopically a number of times. The microscopical examination of the secretion may show the gonococcus or an involution form, at times it will show only a few pus cells. The case then should be treated as gonorrhea, and painstakingly

Chambers, an Englishman, reported five cases of recurrent iritis in which the gonococcus was found in the expressed prostatic fluid. His cases were followed up for five years. Their gonorrheal history dated 4, 5, 9, 10 and 13 years back

Browning, bacteriologist to the London Ophthalmic Hospital, reports ten cases of gonorrheal inits, all cured by proper venereal treatment, massage and vaccines

Schwenker, of the University Eye Clinic at Kiel, found 27 cases of iritis due to gonorrhea, out of 371 cases of iritis

Herrenschwand explains the predisposition to intis in gonorrheal rheumatism by the presence of a latent tuberculosis His treatment is therefore advocated against the latent tuberculosis, and less against the gonorrhea He uses tuberculin

Sander Larsen reports a case of recurrent iritis of 14 years duration. His case was characterized by a stormy onset but benign course. The examination of the prostatic secretion for gonococci in repeated examinations proved to be negative, but finally gonococci were discovered and the iritis cleared up under treatment. The same author used successfully polyvalent gonococcic vaccines in another case.

CASE REPORTS

H R, male, age 35, mechanic, married 11 years No children. Wife has never been pregnant. Had acute specific urthritis 12 years ago. Attack lasted 8 months. The infection flared up 5 years later and persisted five months, this time complicating into what was believed to be an orchitis. The latter affection lasted months, and he was finally discharged as cured by his physician. About four years ago he began to have pains in his joints, and was treated for rheumatism by physician. He had ordinary childhood diseases, and suffered loss of one limb during an accident 25 years ago.

Ocular History Wearing glasses 2½ years off and on About 2½ years ago his right eye became inflamed and felt scratchy. The condition lasted for about one month and the eye recovered partially. Shortly the inflammation returned. He was under care of different ophthalmologists during different intervals. His eye, however, has never become white. At times it would clear up only to become blood-shot again, accompanied by blurred vision. Such history was obtained in patient's own words in May, 1927.

Upon examination, visual acuity was recorded in the-

Right Eye—6/20—1 Left Eye —6/9

External Ocular Exam Right globe considerably injected, especially in its lower half Pupil slightly irregular, but active to direct light and rather prompt Cornea apparently clear Anterior chamber cloudy

Slit Lamp Microscopy Cornea perfectly clear Anterior chamber cloudy Many cells floating freely in the aqueous Retinal pigment border of iris irregular and denuded of its pigment in many places Anterior surface of lens covered with exudate and few synechia noted

Atropine 1% was instilled, and further studies made in one-half hour. Pupil dilated ovally and irregularly. More synechia noted. Anterior surface of lens disclosed a marked plastic exudate. No nodules were noted at iris border.

Ophthalmoscopy Fundus details could not be obtained Patient was referred for a complete medical study, including X-ray of chest The re-

NEWS ITEMS

Getting out our MEDICAL JOURNAL every two weeks always involves much anxiety regarding available material in both quantity and quality, but each issue has usually been a pleasant surprise A fortnight is a brief period in which the medical societies of the State and the counties can accomplish original work in an amount sufficient to make a record of reasonable length in the Journal, but the springs of information are flowing with increasing fullness, and the need for pumping it from indifferent informers is gradually lessening However, recent studies have disclosed unappreciated opportunities for the New YORK STATE MEDICAL JOURNAL and the Journals of the other State societies These studies have been along two lines

1 The number of topics relating to the practice of public health and civic medicine by doc-

tors printed in the Journal

2 The attitude of medical librarians toward

the State Journals

The justification for the existence of State Medical Journals is that they are the organs for recording the activities of the medical societies of the states and the counties. These records reflect activities along two main lines.

1 Scientific medicine

2 Public health and civic medicine

Scientific medicine is well covered in the State Journals It is difficult to see how that feature could be improved But the news departments do not reveal the full extent of the civic activities of the societies The practice of public health and civic medicine is becoming the major activity of county societies, for it enables physicians to discharge the civic duties which they owe to the public Physicians are jealous of any one else who enters any part of the field of the practice of medicine, and therefore the responsibility is upon them to provide the means by which the people may receive the benefits of the practice of every form of medicine, including preventive medicine, public health, and civic medicine.

The popular demand that family doctors shall practice public health and civic medicine has been met with the plan that medical societies shall practice it Abundant records of that practice are already available in the state journals almost exch sively, and they form the nucleus of a new literature on the practice of public health by doctors The records in the New York State Jour-VIL OF MEDICINE are found in the two departments of "News Notes" and "Our Neighbors" An index of the really important news items in the New York State Journal of Medicine during the last twenty months covers nineteen trpewritten sheets,—an amount rather surprising to one who is unfamilar with the Journal The items cover such important topics as county health departments, anti-diphtheria campaigns,

medical work under the Workmen's Compensation law. No longer is the record of the activities of a county medical society confined to a program of scientific papers. The members are now expected to make the influence of the societies felt in official bodies and in educating the people in health matters.

The records of the public health activities of the societies of the states and counties are seldom indexed and abstracted in other medical journals,—and the reason may possibly be that the records are fragmentary. Another reason for their neglect is that public health workers have got into the habit of seeking information from the records in public health journals, lay periodicals, and the reports of voluntary associations formed to practice public health, rather than from medical journals

The subject of the record of the practice of public health by doctors was brought before the annual meeting of the Medical Library Association on September 5 in the New York Academy of Medicine (See this Journal, Oct 1, 1928, page 1165) The Association adopted a memorial suggesting that the officers of the State Society should publish descriptions of their activities in greater number and fullness, and should index the articles in such a way that research workers can find the information readily

The opinion is sometimes expressed that the news items of the New York State Journal of Medicine are not properly balanced in that they carry an undue proportion of items on public health

The reply is that the Journal reports the subjects which are discussed before the medical When the officers of the State Medical Society visit the District Branches and County Societies, nine-tenths of their talks are on the practice of public health by the societies James E Sadlier, President of the State Society last year, and Chairman of the Committee on Public Relations this year, is now visiting all the District Branch meetings in order to urge the county societies to take up the practice of public health and civic medicine. His addresses con stitute "Live" news which an up-to-date state Journal must print It happens that the work of the Committee on Public Relations consists largely in educating the physicians in the standard methods of the practice of public health That committee is dependent on publicity, and the Journal is the principal medium through which its educational work is carried on result is an apparent preponderance of public health items in the Journal However, the remedy is not to curtail the reports of public health work, but to increase the number and quantity of the news items from other departments of the State Society

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication Business and Editorial Office-2 East 103rd Street, New York, N Y Telephone, Atwater 5056

The Medical Society of the State of New York is not responsible for views or statements, outside of its own authoritative actions published in the Journal. Views expressed in the various departments of the Journal represent the views of the writers.

THE DIRECTORY OF OFFICERS AND COMMITTEEMEN

The Directory of officers and committeemen of the Medical Society of the State of New York that is printed on page 2039 is a revelation of the number of physicians that are engaged in its activities. There are over 100 physicians working as officers and committeemen of the State Society, and 50 more are officers of the District Branches may be added the 180 officers of the county

medical societies, and also the 800 health officers of the State, making a total of 1130 physicians out of the 11,718 membership of the State Society, who take part in the civic duties devolving upon medical men

Of what other calling can it be said that ten per cent of its members occupy positions of responsibility for performing the civic duties of the profession?

MEDICAL PROGRESS

Malignant Growth in Hybrids —G Häussler of the Heidelberg Cancer Institute has studied the subject of hybridism as a causal factor in Naturally we can know little about this subject in man and the higher mammals but the phenomenon has been investigated in mice, certain fowls, and especially in fishes The author has crossed two kinds of carp—fish which bring forth their young alive-which hybridization naturally causes a disturbance in the pigment relations in the hybrids and at the same time a melanotic tumor formation in certain of them Thus the diffuse maculation of one species appears in a large percentage of the offspring and 20 per cent of the same show the tumor formation which was of the type known as melanophore, while the melanophores normally present in the surrounding tissues showed an increase We may perhaps infer, although the author does not allude to the coincidence, that the greater frequency of melanoma in dapple-grey horses is due to the same disturbance of pigment conditions, and possibly also the pigment disturbance of xeroderma pigmentosum in mankind, which is later associated with malignancy, is remotely connected with the same principle If this be the case then the mere fact of hybridization is not final in itself but only because of the resulting pigment disturbance The author is content in this connection to refer only to the well known malignancy of the pigmented nevus in The malignancy of the fish tumors is as yet undetermined The growth is slow and no metastases have yet been noted, but the power of growth seems unlimited and in some cases emaciation has set in It has long been known by breeders of ornamental fishes that hybrids are apt to present "pigment tumors"-Klimsche Wochenschrift, August 12, 1928

Experimental Influencing of Callus Formation in Fractures -K. Glässner and J Hass, who are associated respectively with the pharmacological and orthopedic chairs of the University of Vienna, have combined in the interest of a practical problem Going back historically, both phosphorus and calcium have been recognized as essential to the healing of fractures Later studies have shown that certain glands of internal secretion play an important role in osteogenesis. The authors selected the thymus out of three of these bodies-the thymus, the parathyroids and the sex-glands—as an object of special research Many data were based on thymus extirpation, while in a minority of cases thymus substance was fed to patients with various The results were conflicting-thus thymectomy certainly interferes with callus formation, while thymus implantation, which seems to foster the latter, has been pronounced toxic in its effects—it is a powerful depressant and may cause death with symptoms of low blood pressure The authors dealt chiefly with induced fracture in certain lower animals, in where there was proper x-ray control ous endocrine extracts were tested simultaneously with the result that the thymus seemed far and away the best for the purpose The authors were enough interested in the problem to test thymus extract in human cases of fracture Two sets of cases were used as control, in one of which thymus extract was utilized while the other was left to na-The authors claim that the clinical results were much superior where thymus extract was utilized, this fraction containing the phosphorus requisite for bone growth -Klimsche Wochenschrift August 26, 1928

Chronic Hemiencephalitis-R. Hanau has recently seen a number of cases of chronic encephalitis which were limited to one of the hemispheres, but is unable to find much of anything on this subject in the literature first case was in a woman of 38 years a year or so there had been symptoms, limited to the left side, of paralysis with muscular rigidity The left side of the face was also in-There was tremor of the left arm and No clinical history of encephalitis is mentioned, although the symptoms suggest those which are sequelæ of the epidemic form. nor was there any history of influenza second case was in a man of 32 years with a history pointing to encephalitis complicating influenza in 1918 From this there was apparently a complete recovery, but in 1924 insidious symptoms of paresis and tremor developed in the left arm and leg, and some rigidity appeared later. The third patient, a woman of 43 years, developed a grippe-like affection in 1920 which was followed shortly by an apparent paralytic stroke, later the diagnosis was changed to tumor of the brain but after a certain period of observation it was again changed to encephalitis, although the picture was quite atypical and some symptoms were bilateral A fourth case in a man in whom the symptoms dated from a cranial injury received during the war, ran a prolonged course and the last diagnosis had been hysteria, but study by the author led him

DISTRICT BRANCH MEETINGS

The meetings of the District Branches this fall have been of unusual interest and value, and have been attended by the members in record-breaking numbers The reason is that the medical societies of the counties and the State are active along practical lines which appeal to family physicians The committees of the State Society have devised the means by which the medical profession may tulfill its obligations to the public and to its individual members The leaders have led the members wisely and have produced results which are plainly evident Dr Trick, President of the State Society, has emphasized its outstanding accomplishments in recent years, among them being the Medical Practice Act of 1926, the development of intimate relations with the Compen-

sation Commission, and the assumption of leadership in the fields of practice that have been preoccupied by lay organizations. The influence of every physician in New York State has been enhanced by the promotion of these activities, and the physicians have expressed their appreciation by their attendance at the District Branches

The programs of the Branch meetings have been well designed to assist physicians to practice medicine in the modern scientific way. Some of the speakers have been invited to give their papers before more than one Branch meeting. The success of the meetings is evidence of the increasing interest of physicians in providing the people with medical service along all necessary lines.

LOOKING BACKWARD

This Journal Twenty Years Ago

Observations This JOURNAL of October, 1908, contains a page of wise observations, presumably of editorial origin. Some are of practical value to physicians as the following examples will show—Editor's note.

"He who speaks ill of his own profession, often will not bear patiently with another who does the same. The reason of this is to be found in vanity. When we malign others we self-consciously exalt ourselves above them. When one abuses his own profession he privately, in his own mind, exempts himself, but when he hears another abuse it, he is not sure that he is exempted."

"A patient who had been committed to one of our hospitals for the insane was asked how he came to be there. He replied that he and all the other people in the world happened to have a slight difference of opinion, they said that he was insane, and he said that they were insane, then they put it to vote, and outvoted him, and there he was. This shows that when the majority against one is overwhelming, he must have much courage of conviction to persist in his own opinions"

"In dealing with a large man whose goodwill you desire, take care that when he quits you he has formed a good opinion of you, when dealing with a small man, take care that he quits you with a good opinion of himself, if you desire his esteem. This, however, involves two parties to the interview, and if you are large yourself, you will not be concerned one way or the other."

"In the preparation of a scientific paper for presentation or publication, one should play the part of two artists—first the painter and then the sculptor The former produces his

result by adding, the latter, by taking away The author after constructing his paper may do wisely to turn sculptor and chip away until it stands out free from the dross of verbiage with which it was originally encumbered"

"If there is any joy which man should prize, it is the joy of relieving distress. There is but one greater, and that is the joy of preventing distress. The life of the physician is spent in the midst of both of these, and he should be the most blessed of men."

"None is perfect in the eyes of all The wise man has his follies as well as the fool—the difference being that the follies of the wise man are known to himself but hidden from the world, while the follies of the fool are hidden from himself but known to the world Hilarity and buoyancy are not the exclusive property of the fool but are often the attributes of genius, we are often deceived when we mistake gravity for greatness, solemnity for wisdom, and pomposity for erudition"

"Pride possesses this merit—it prevents some men from being ridiculous, and this disadvantage—it makes some men ridiculous Cultivate pride, beware of pride"

"Many excellent medical authors are more occupied in writing what deserves to be read than in doing what deserves to be written"

"It is an ancient error to assume that what an author writes is the mirror of his mind. If the devil himself should write a book, it would be in praise of virtue, because the good would buy it for use, and the bad for ostentation. Sanitary and moral prophylaxis enjoys this great advantage in the production of its literature."

Hardy normal or normal leucocyte count suggests that until physicians are generally cognizant of the disease, state and municipal laboratories should test all sera, sent for Widal tests, for brucella as well The treatment of abortus infection has been largely symptom-Mercurochrome, intravenously, which has been tried in Malta fever and, in South Africa, in abortus infection, is thought to have been helpful in some cases, but Ross and Martin claim that in the drug concentration obtained in the blood it has no action on the Abortus infection specific organism in vitro presents a more acute problem in rural communities and small towns, because of the dangers of direct contact with infected animals and the commoner use of raw milk -American Iournal of the Medical Sciences, September, 1928, clxxv1, 3

Genital Affections Following Angina-H Küstner of the Gynecological Clinic, University of Leipzig, considers this sequence solely in the female For some years past, and especially in recent months the author has noted that relatively mild affections of the throat have been followed by disease in the genitals which is subdivided as follows non-puerperal uterus, ovaries, and puerperal uterus results show lack of uniformity for in the non-puerperal uterus the chief lesion is destruction of the mucosa during the periods, in the ovaries it is rupture of the follicle and the secondary changes which lead to the formation of the corpus luteum, and finally in the puerperium it is a secondary infection originating in the raw surface left by the placenta In the first of these types women heretofore genitally intact have, as a result of an infection in the upper air passages, developed a type of leucorrhea characterized by purulent quality and fetid odor The discharge was often burdensome to the patient. In these cases the author abstained from local measures and gave only ergot and full or sitz baths, invariably with good outcome The local mischief in these cases, usually in the nasopharynx, is accompanied by some temperature rise and the secondary genital lesion is classed as an acute and metastatic endometritis metastasis is to the ovary the symptoms may suggest extrauterine gestation with retrouterme hematocele The third or puerperal type is fortunately very rare, and when present constitutes a special type of puerperal infec-The entire subject shades into others for example the genital complications of influenza. In the affections under consideration the offending organisms are the ordinary staphylococci and streptococci, and in certain cases these may complicate an influenza infection — Deutsche medizinische Wochenschrift, Tuly 13, 1928

Etiology of Sepsis —Schemensky and Noetel, representing Prof Hilgerman of the Hygienic Institute of Landsberg, refer to the great number of microorganisms which can set up sensis and describe at length the case of a man of 54 who was admitted to hospital for nephritis after a recent experience of facial erysipelas complicated by carbuncle The inference was that the renal lesson was a meta-Further observation led to change of the diagnosis from nephritis to nephrosis to which was added a sepsis-like temperature curve and a later change of diagnosis was to sepsis following the erysipelas, of which condition the renal lesion was merely a symptom Attempts to cultivate bacteria from the blood then gave the surprising result that meningococci were present therein and after repeated corroboration the diagnosis was elaborated to meningococcus-sepsis There had been not the slightest evidence of meningitis and the lumbar punctates had been normal from first One of the manifestations from the time of admission had been dilatation of the heart, and the patient finally succumbed to cardiac failure Autopsy showed hypertrophy and dilatation of the heart, verrucous endocarditis, and exudative pericarditis, kidneys much enlarged, smooth, and of dirty yellow The necropsy diagnosis was meningococcus sepsis with prominence of a nephrosis as a local lesion. The authors analyze the case at great length and evidently it is paradoxical in several respects No similar cases are quoted from the literature and the various symptoms show that some accidental element of complication must have been present organisms of erysipelas and carbuncle could hardly be made responsible for the picture of sepsis nor can the nephrosis be brought into any causal relationship with the meningococ-We can only assume that in the midst of the other pathological processes a latent meningococcus infection became active in such a way that meningitis was not brought about. -Munchener medizinische Wochenschrift, Aug 10, 1928

Is the Tonsil a Protective Organ?—This question is asked by Dr T von Liebermann of Budapest who adds another—is tonsillitis a protective process? Although these questions would be answered by many in the affirmative the author personally is very sceptical. After tonsillectomy there are no deprivation symptoms, which indicates that the organs have no definite functions or at least none which cannot at once be taken over by others. The prevalence of tonsillectomy in the United States, where, he says, sound and diseased

finally to place it in the encephalitis group Apparently not one of the cases could be referred to acute lethargic encephalitis, despite the resemblance of the picture to the sequelæ of the latter Three of the four gave a history of influenza—Munchener medisimische Wochenschrift, Aug 17, 1928

Inflammation of the Lumbar Roots—Prof. N Gierlich of Wiesbaden reports 8 cases of lumbar root neuritis, a condition readily recognized through the following the zone of pain does not conform to the distribution of the peripheral nerves but to that of the nerve roots, the tender pressure points are absent from the peripheral nerves but have to do with the nerve roots, in severe cases there is depression or absence of the skin and tendon reflexes and in general there is early supervention of the muscle atrophies and trophic dis-In summing up, the author adds the following lumbar root neuritis is the most frequent affection involving the lumbar nerves, for peripheral neuralgia of the lumbar region The most characteristic symptom is the lancinating pain with the sensory and motor irritative and defective manifestations corresponding to the lumbar root area typical tender point is to be found about 3 cm to the side of the spinous process of the vertebra which corresponds to the affected nerve This point has about the area of the print of the thumb and comprises two lumbar roots If there are any tender points along the peripheral nerves they are but slightly in evi-Therapeutically we make use of heat in some form, as diathermy, and such antineuralgics as acetosalicylic acid, while some of the cocaine derivatives may be injected intramuscularly or in the region of the tender points It must be borne in mind that a symptomatic root neuritis may develop in connection with troubles of the adnexa or urinary tract and hernia -Deutsche medizinische Wochenschrift, Aug 24, 1928

Plumbic Icterus-Prof Carl Lewin refers first to the general picture of toxic icterus and comes then to a special form due to lead intoxication It is known that the latter condition is often accompanied by a slight jaundice, although there may be severe cases in which the liver is intact. In cases of icterus the catarrhal form of the latter may be excluded, for the cases tested proved to be of the hematogenous or hematolytic group The author narrates 4 cases of this kind in which the icterus was of slight degree, with no discoloration of feces and no direct bilirubin in the serum, although the test for indirect bilirubin was positive, there was no bilirubin in the urine but abundant urobilin and urobilinogen In a second group of six cases the picture was

quite different with intense icterus, liver enlarged and tender, spleen enlarged, stools mostly discolored, both direct and indirect bilirubin in the serum, biliary coloring matters in the urine, etc. The author also considers various atypical cases including two of acute yellow atrophy of the liver, believed to represent the highest degree of the toxic hepatic in-He is inclined to regard all of these types of disease as due to a common originthe action of the lead on the liver parenchyma -although it need not follow that the different grades of severity are due to different degrees of intoxication Some of the symptoms are not due to the toxic action of lead on the parenchyma In regard to plumbic anemia this does not stand in any definite relation to the hepatic lesion and in severe plumbic anemia the liver may escape injury, while in severe lesion of the liver the blood may not show much change It appears that the state of the liver in lead poisoning has never received its due from pathologists, and the literature of icterus in this affection is very scanty-Deutsche medizinische Wochenschrift, August 31, 1928

The Clinical Aspects of Brucella Melitensis Var Abortus Infection in Men.—In reporting the first two cases of Brucella melitensis infection recognized in Pennsylvania, Richard A Kern quotes statistics showing that the infection is present in cattle, and in high incidence, in every section of the country The pathogenicity of the abortus organism for man was proven less than four years ago, and up to the time of writing 36 cases had been reported There is as yet a very low index of clinical suspicion of the presence of the disease on the part of general practitioners, and as a result many cases probably go undiagnosed With a view to furthering clinical consciousness of the disease Kern has compiled the clinical data of available American case reports together with the more important laboratory procedures There is no characteristic clinical picture of abortus in-It strikingly simulates a number of fection other diseases It may be described as an infection with an irregular course and indefinite The onset symptoms are those of a vague general infection. Fever is the most There may be malaise, frequent complaint headache, muscular pains, generalized or in the back and extremities, chilliness, and sweats Occasional symptoms are slight sore throat, cough, hoarseness, nervousness, and insomnia The differential diagnosis depends upon the laboratory findings Two procedures are essential (1) Blood culture and (2) serum agglutination tests The blood picture shows es sentially a slight to moderate secondary anemia, a color index less than one, and a sub-

By LLOYD PAUL STRYKER, ESQ. Counsel, Medical Society of the State of New York

THE PROBLEM OF ASCERTAINING WHAT THE LAW IS

Even the specialist No one is omniscient cannot know all that there is to be known in regard to the knowledge as to which he professes to be expert The most erudite and studious professional man, whether he be doctor, engineer or lawyer, finds life too short in which to acquire a perfect and complete knowledge of his specialty. No lawyer knows all the law, he is indeed a studious and conscientious man if he knows a good deal of it No lawyer can advise his client properly or can represent him adequately in court or conference, unless he has a thorough grasp of the law pertaining to the subject, and has thus come to an understanding of his client's rights One of the problems, therefore, confronting every practitioner is the problem of ascertaining what the law is We have selected this subject as the title of our sixth editorial in our promised series

To one who feels himself well versed in jurisprudence, it is a chastening experience to sit within the calm, cool atmosphere of a great law library There are many such in this city As one sits in such a treasury of knowledge, as for instance, the law library of our New York Bar Association, and glances at the walls and stacks piled high with thousands upon thousands of the case reports, the statutes, the annotations and the various textbooks, he cannot fail to realize that in one short life no one, were he to work fourteen hours a day beginning at the age of twenty-one, could read through more than a small fraction of the millions of pages of accumulated wisdom cially is this true for the American lawyer Here in the United States, with forty-eight separate commonwealths, each with its highest court and intermediate tribunals of appeal, and with our great system of Federal Courts, with the National Congress and forty-eight separate legislatures, with the mass of law which is yearly, monthly and indeed daily added to our store, it becomes evident that no one, no matter what personal endowments or industry he might possess, could possibly acquire, digest and understand so vast, so gargentuan a mass of learning

As the writer glances about his own comparatively small working library, he observes upon the shelves 246 volumes of the New York Court of Appeals Reports, 221 volumes of the Appellate Division Reports, 129 volumes of the Miscellaneous Reports, 92 volumes of the Hun Reports, more than 150 volumes of the Session Laws, 34 volumes of Abbott's New York Encyclopedic Digest, 43 volumes of Corpus Juris each containing an average of about twelve hundred pages, 32 volumes of Cyclopedia of Law and Procedure each with approximately the same number of pages, 66 volumes of McKinney's Annotated Laws, three or four shelves of textbooks, twenty or more volumes of the Federal Statutes Annotated, twenty or more volumes of the decisions and rulings upon Income Tax, some fifteen or more bound volumes of Cases and Points, the Civil Practice Act with a thousand or more pages of closely printed matter, and nearly as many in the Penal Law and Code of Criminal Pro-He realizes that even in this small accumulation of legal knowledge, there is a fund of information which neither he, nor any other, can fully and completely acquire as his

Inasmuch, therefore, as no lawyer can know all the law, the daily problem presented is the ascertainment of what the law is Law books are but tools with which the lawyer works If he does not immediately know the law, he must at least know where and how promptly and accurately to find it He must have a working knowledge of the statutes of his state and of its decisions, not only this but a similar acquaintance with the laws of Congress, 271 United States Supreme Court Reports and more than 265 volumes of Federal Reports There are certain branches of the law which the efficient practitioner must have at his What these branches are, depend fingertips in large measure on the particular specialty in which he is engaged. Thus, for example, if a lawyer is largely engaged in court in the actual trial of cases, he must have a very complete and ready knowledge of the rules of evi-These, like other branches of the law, are derived from hundreds of decisions, and in some part from statutes He must know what these are, but he must know more than that. He must understand the philosophy and the reasoning of the decisions A trial lawver's knowledge of the rules of evidence should be instinctive. He should sense, and sense accurately, what questions are, and what are not proper to be allowed. This applies not only to the objections which he may interpose to

tonsils are alike removed wholesale, has brought light nothing which points to priva-Naturally removal of distion symptoms eased tonsils may be followed by improved general health. In regard to the possibility that tonsillitis is a protective process the author has found that the first attacks in childhood are for the most part uncomplicated—there is not even a reaction in the regionary lymph Such attacks are termed by the author "benign tonsillitis" There is a sharp rise of temperature, but this rapidly subsides The opposite type of what might be called "malignant tonsillitis" is characterised by insidious course, slight general reaction, and involvement of the said lymph nodes After many attacks of tonsillitis the youthful organism appears to develop an immunity which probably is local at first, the immune substances then entering into the blood stream. Under certain circumstances—notably penetration of the tonsillar capsule—the offending microorganisms may also enter the circulation and set up thrombophlebitis with acute local metastases which may imperil life, while in more chronic forms of tonsillitis we see the insidious penetration of micro-organisms into remote localities, notably in the endocardium regards the acquired immunity to attacks of tonsilitis it should be borne in mind that the tonsils normally undergo involution, so that in subjects over 26 years of age there is not much tonsillar tissue left -Deutsche medizimsche Wochenschrift, August 17, 1928

Simulation of Tuberculous Joints by Nonspecific Affections -H Friedrich of the Surgical Clinic of Erlangen University begins his paper with the statement that the diagnosis of chronic monoarticular joint disease is one of the most delicate of problems, as shown by a seven years' follow-up of cases He writes at great length on the subject, giving 12 long case histories, and does not arrive at any stereotyped conclusions His thesis may be best illuminated by some of these cases Thus a man of 39 without any family taint developed an insidious affection of the left knee joint with some failure of general health Repeated examination showed no evidence of general disease, although the röntgenograms certainly suggested tuberculosis The case came to resection by reason of the local pathology but the specimen showed not the slightest evidence of tuberculosis under the microscope or bacteriologically The mature diagnosis was chronic purulent arthritis of nonspecific origin Since the resection, 5 years ago, the general condition has been excellent. This case is typical of the series and the author naturally concludes that the local finds are overvalued and that the clinical and röntgen finds which

point to tuberculosis are misleading. The author lays great stress on the tuberculin test, as carried out by Tonniessen, at regular intervals. If there be any puncture fluid available this should be employed in animal experiment. Once there has been a satisfactory diagnosis made it is evident that the prognosis must be far better in the nonspecific case. The author is in favor of retaining the designation "pseudotuberculosis" for these nonspecific joints, for this is very convenient in the clinic. But even "nonspecific" arthritis has its uses, for this eliminates not only tuberculosis but gonorrhea and syphilis—Munchener medizinische Wochenschrift, July 6, 1928

Chromic Colitis and Its Effects—Arthur D White claims that practically all cases of chronic colitis are spastic in origin Text-books have been prone to classify colonic troubles as membranous, hemorrhagic, mucous, and ulcerative A type referred to by some authors as spastic has until recently received little at-This should not be considered as a separate entity, but as a constant finding in all cases of chronic colonic disease. Any condition whereby the vagus is over-stimulated beyond the point of balance by the sympathetic causes excessive tonus, and spasticity occurs, which may affect any part of the nerve distribu-Hence an irritable cecum or a disturbance of the motor action of the cecum, as from an adherent or inflamed appendix, brings about an increased tonicity of the stomach and intestinal tract reversely through Auerbach's plexus and to the Irritating hyperchlorhydria usually produces spasticity of the colon On the other hand, an irritable bowel produces stomach symptoms Heart disturbances may be present both as cause and effect Clinically the symptoms of chronic bowel disturbance are distant, they are nervous in character—headaches, difficulty in concentration, lumbago, variable appetite, sleeplessness, palpitation, and other disturb-Disease in any ances of the heart's action part of the body may set up a definite spasm of the colon, also anything that either irritates the bowel locally or its terminal nerve endings, or overstimulates the musculature. Consequently a wide survey should be made of the patient with chronic colitis and everything should be taken care of that can either directly or indirectly affect the colon, even to a consideration of the mental and nervous make-up of the patient As regards food, each patient demands individual consideration Irritating and gas-producing foods must be eliminated, and those selected which furnish The old questhe proper proportion of bulk tion of which occurs first, the disturbed nervous system or the irritable bowel, is easily answered -Southern Medical Journal, September, 1928, xx1, 9

evamined without fear, and revised without reluctance, rather than to have the character of our law impaired, and the beauty and harmony of the system destroyed by the perpetuity of error"

In considering the weight to be attached to a judicial opinion, the lawyer should know and reflect upon the known character and ability of the judge enunciating it. The opinions of some judges are given more weight and credence than those of others. When, for example, a lawyer is able to refer to an opinion written by Chief Justice Marshall or by Judge Story, he is certain that that opinion will have weight in any court.

In some of the great law offices, the partners are accustomed to rely upon the researches of their young assistants, due to the great pressure of modern life. To the writer, however, it has always seemed that this method is not without its disadvantages. One of the greatest lawyers of the Bar has told us that he always makes his own personal researches of the law. Much is to be gained

from this course. It is only in this way that a real, personal, true knowledge of the law may be acquired. Legal misconceptions may be run down, and collateral leads followed up

But it is not only to the digests, the statutes, the decisions, the textbooks and the encyclopedias that the lawyer must turn. If he would have a complete understanding, he must acquire and master an understanding of the history of the times in which the cases were enunciated. Especially is this true in studying the reports of England. Only through an understanding of the times, may he reach a full comprehension of the real nature and import of the decision which he examines

The problem, then, of ascertaining what the law is, is one of the great problems confronting every lawyer. The industry, the ability and the understanding which he brings to bear upon this problem, in large measure will determine the results which he may accomplish, and ultimately that in which every lawver may justly take a deep concern,—his standing at the Bar

PSORIASIS OF THE SCALP-X-RAY TREATMENT

The complaint in this case charged that the plaintiff, a woman about 22 years of age, employed the defendant, a physician, to attend and cure her of the skin disease from which she was suffering, but that the defendant did not use reasonable or proper skill in endeavoring to cure the plaintiff and negligently prescribed and administered to the plaintiff's head X-ray treatment on four different occasions, which treatments are claimed to have been excessive. The plaintiff claims that as a result of the treatment, her scalp was burned and her general health impaired. Damages were prayed for in the sum of \$15,000

The plaintiff was first seen by the doctor on November 27th, and upon examination the doctor found that she was suffering from psoriasis of the scalp, as well as various parts of the body. At that time he advised the use of ointment on the body as well as the scalp. The patient said that she was willing to have the ointment applied to her body, but inasmuch as she was a working girl, she did not want the ointment applied to her scalp. The doctor then said that he would apply X-ray treatment to the scalp, to which the plaintiff consented.

The first treatment was given to the plaintiff's scalp that day, the doctor using a Wappler machine in perfect condition. The factors of dosage were spark gap 6 inches, milliamperes 3, distance 8 inches, time of exposure 30 seconds. The patient returned for treatment on December 4th and December 11th, and on both of these occasions the doctor gave her exactly the same treatment.

When she returned on December 18th, she complained that her hair was falling out. On that day the doctor gave her treatment with a quartz mercury vapor lamp, time of exposure being 10 minutes, the lamp being 12 inches above her head while the light was exposed to her scalp. The lamp treatment was repeated again on January 2nd. The patient never returned for further treatment and the doctor did not see or treat her after that date. At no time during the treatment was there any evidence of a burn or injury to the scalp.

The plaintiff noticed the case for trial, but when the case appeared on the calendar, the plaintiff's attorney realizing that the case was without merit, failed to appear and on motion of defendant's counsel, the case was dismissed 2036 LEGAL

the questions of his adversary, but to the proper framing of his own questions to his witnesses upon direct examination. The more accurate and complete his knowledge is, the more ready will he be to defend his objection or the question which he asks. It were well for him to have at his finger-tips the names of the leading cases and the various volumes where they are found An ability readily to refer to these ofttimes is of compelling persuasive force with the trial judge He must know this branch of the law in the same way that the surgeon knows and understands ana-In the middle of an operation, the surgeon cannot leave his patient and refer to the library to find out what to do The same applies to the lawyer in the midst of the trial

Law, like medicine, is a fascinating study for the very reason that it is so complex, so

large, and so difficult to acquire

When a lawyer is presented by his client with a legal problem, if he is a careful and a conscientious man, even though he feels himself equipped to give immediate advice, he will not do so if he is wise, without first refreshing and verifying the knowledge which he believes himself to possess this knowledge may be acquired within a short Often it is a matter of days', weeks' or months' diligent research He should first know whether any statute of his state or any Congressional enactment has in any wise touched upon the subject If he finds out that it has, he must then run down that law, and see in what way, if at all, it has been amended, added to, or repealed Having done this, he must ascertain how the courts may have con-Sometimes he will find hundreds of cases interpreting the various words or sentences of the statute, oftentimes these decisions will be or will seem to be contradictory or conflicting If they are conflicting, he must reconcile them, and ascertain what the latest or the true interpretation is Ofttimes, he will find no judicial interpretation of the subject, in which case he must make his own, bringing to bear such knowledge as he has or may acquire of the exact legal meaning of the various words and phrases used, and must couple this with a proper application of the accepted canons of construction

Increasing fields have now been covered by the enactments of our state or national legislatures, but there are still many subjects covered solely by the common law, and the common law in this state, in the absence of statutory provision, still applies. To ascertain what the common law may be, sometimes it will be necessary for the lawyer to go back to the earliest decisions of England, as far back perhaps as the Year Books which were written seven centuries ago.

to wend his course on down through the various decisions of the English courts If he finds there the principle applicable, it will then be his duty to search through the digests, the textbooks and the case reports of his own state, as well as the decisions of the Federal Courts, to find out how the principle which he has found in English law, has been adopted or applied in our own courts "The best evidence of the common law," says Chancellor Kent, "is to be found in the decisions of the courts of justice, contained in numerous volumes of reports, and in the treatises and digests of learned men, which have been multiplying from the earliest periods of the English history down to the present time * * * If a decision has been made upon solemn argument and mature deliberation, the presumption is in favor of its correctness, and the community have a right to regard it as a just declaration or exposition of the law, and to regulate their actions and contracts by it"

The rule of stare decisis means that the courts will abide by and accept as precedents the well considered adjudications of the highest courts in times past. This rule has been adopted in this country and in the courts of "The English courts," says Chan-England cellor Kent, "seem now to consider it to be their duty to adhere to the authority of adjudged cases, when they have been so clearly, and so often, or so long established, as to create a practical rule of property, notwithstanding they may feel the hardship, or not perceive the reasonableness, of the rule" Were it not for this principle, no lawyer could accurately or properly advise his client What he advises is based upon what the courts have decided, and yet as times change, concepts of duty and of justice change with them The result of this must be that principles of justice, once firmly accepted, are constantly open to re-evamination and to change or alteration in the light of new conditions. This change is going on every day Any student of the present trend of the decisions of our New York Court of Appeals must have observed it

In examining the various authorities which the lawyer must consider, he must make up his own mind as to the validity of the reasoning in the opinion. If it is unsound, or based upon a fallacy, the probability is that in some later case,—perhaps in the one in which he is called upon to advise,—the courts will ignore a former decision, and will enunciate a new principle. In the thousands of volumes of reported cases, the lawyer will find that some have been well considered, and some have not "It is probable," says Chancellor Kent, "that the records of many of the courts in this country are replete with hasty and crude decisions, and such cases ought to be

NEWS NOTES

THE SIXTH DISTRICT BRANCH

The meeting of the Sixth District Branch, held in Elmira on Tuesday, September 25th, in the assembly room of the Arnot-Ogden Memorail Hospital, was entirely successful. The registered attendance was 150 physicians—or 39% of the total membership of 381 for the District. The physicians were the guests of the Hospital and the Cheming County Medical Society at a noon luncheon in the large dining room of the Hospital. Fifty ladies were also present and were entertained by the wives of the doctors of Elmira at the Country Club, Mark Twain's Home, and Elmira College.

The program of the meeting was carried out as it was planned and, in fact, each feature was a little ahead of its scheduled time. Great credit is due the local committee for arranging and executing a program that filled every moment of time and yet could be observed without hurry or the omission of any feature. The local committee consisted of Drs. Reeve B. Howland and Joseph S. Lewis of Elmira, and Dr. C. F. Leet of Horseheads.

The first speaker on the program was Mr Lloyd P Stryker, Counsel of the Medical Society of the State of New York, who discussed "The Doctor and the Law" Mr Stryker is peculiarly well fitted to speak on the subject, for he has defended hundreds of physicians against whom malpractice suits have been brought. He said that the law requires a physician to possess certain minimum standards of educational preparation, and it assumes that the doctor will make use of that knowledge and skill in diagnosing and treating each case that comes to him

The law also recognizes degrees of knowledge and skill, and does not require the doctor to make use of knowledge and procedures that are not available in his community. For example, the average doctor is not to be held accountable for failure to operate on an acute case of gall-stone bladder, for he is not presumed to be a skilled surgeon. However, a doctor is expected to make use of the usual diagnostic and therapeutic measures that are available in his community. He is expected, for example, to have an x-ray taken of every fracture, or at least to urge the patient to have it taken. The failure to make use of the facilities at his disposal is the ground for most malpractice suits.

Mr Stryker's paper is of practical value to every physician and it will be published in November first issue of this JOURNAL

Mr Stryker was asked whether or not a physician could legally disclose knowledge obtained

at an autopsy, and he replied that he would answer the question in a paper which he is now preparing for publication in the Legal Department of the JOURNAL (See also this JOURNAL, Oct 1, 1928, page 1187)

The second paper on the program was entitled "Studies on Breast Cancer," by Dr Jonathan M Wainwright, of Scranton, Pa Dr Wainwright had cut sections of cancerous breasts extending completely across the breasts from one edge to the opposite side. These sections were thin enough for study with the high powers of a microscope, although some were ten inches in length. The Doctor used the slides in a stere-opticon and projected them on a screen where they stood out in vivid colors and details, the staining showing the cancerous cells in dark purple against the light red of normal tissue.

A striking feature of the sections was that they showed small nodules of cancerous cells remote from the parent tumor. The nodules were often of small size and could not be detected by the appearance or feel of the gross specimen, neither would they be likely to be detected by an examination of the parent tumor and one or two small sections taken at random at a distance from the parent lesion.

These sections reaching entirely across the entire breast are the first that have been made in the study of cancer, and they open up a new field in cancer therapeutics and research. Dr Wainwright will submit an abstract of his paper and photographs of his sections for publication in an early issue of this Journal.

Dr Elliott T Bush of Elmira showed lantern slides of X-rays of cases of obstruction of the ureters occurring in his service at St Joseph's Hospital, Elmira, and read a paper on the conditions that were found

The causative factors in the maternal mortality were discussed by Dr Stuardt B Blakely of Binghamton, and Dr De Porte, of the Division of Vital Statistics of the New York State Department of Health Dr Blakely said that by far the most important period of postnatal care of the mother was the first hour after labor,—the period called by some the "Fourth Stage of Labor"

Regarding the education of doctors in the education of mothers the Doctor said, "No medical school can give a man a conscience, or cure him of carelessness"

Dr Charles L Scudder of Boston gave a practical talk on the subject "Recent Advances in the Treatment of Fractures," which dealt with mod-

LONDON LETTER

SUBSTITUTES FOR NURSING HOMES

A report has just been issued by a Special Committee of Inquiry appointed by King Edward's Hospital Fund for London, "To enquire and report upon the question of hospital accommodation in London for persons prepared to pay more than ordinary voluntary hospital patients" This report crystallises the opinion of the public and of the medical profession upon a subject that has been much debated of late Thirty years ago or so it was the custom for operations to be performed at the patient's own home, but the advance of aseptic surgery and the increasing complications of surgical technique places such a strain upon all concerned that it became the custom for better-class patients to seek admission to some Institution where the necessary The result was seen amenities were obtainable in the provision of so-called "Nursing-Homes"some of them adequately fitted, but many of them ordinary dwelling-houses converted more or less satisfactorily to their new purpose It soon became evident that the patients who were willing and able to pay for their maintenance and treatment were much worse off as far as accommodation was concerned than the very poor who were received without payment in the Voluntary Hospitals For many years there was no alternative and the nursing homes were "put up with" though not without much criticism, chiefly by visitors from more favoured countries, one of the criticisms which had a great deal of truth in it being that the charges at the Nursing Homes were out of all proportion to the benefits Then two of the leading London conferred Hospitals-St Thomas's and Guy's-put aside a certain number of beds for patients willing to pay for maintenance, and a modified fee for medical attendance, but who were unable to pay the full cost of nursing-home treatment movement spread until to-day there are 1055 beds available in 80 hospitals for persons other than ordinary hospital patients. Of the total number of beds, 522 are at General Hospitals with Resident Medical Officers The advantages of this dent Medical Officers system, which is already in operation in America and Canada, are so obvious that it is difficult to explain the long delay which has occurred in its provision in England However, the whole subject has now been reviewed by an authoritative body which, in an unanimous report, states that the present provision of 1055 beds has proved to be a very valuable addition to the Voluntary

Hospital service of London, and that a material extension of this provision is urgently required to meet the existing demand. The Committee considers that if the system were amplified the Hospitals would greatly extend their influence and increase their prestige. The question of the provision and maintenance of new beds has been very carefully gone into, and the Report is an admirable example of careful detailed analysis.

VACCINATION

A Committee appointed by the Ministry of Health to enquire into and report on matters relating to vaccine lymph and on the methods available to diminish risks arising from vaccination, Though vaccination has issued its Report has never been compulsory in England (the baby could not be "torn from its mother's arms") fines and even imprisonment have been inflicted on obdurate parents, but in 1898 a Bill was passed which allowed a parent to obtain exemption from vaccination for his child by making a statutory declaration before a Justice of the Peace or a Commissioner for Oaths that he had "conscientious objection" to vaccination 1907 the method of obtaining exemption was made easier still with the result that while in 1899 664 per cent were primarily vaccinated and only 36 per cent were legally exempted, in 1922 the exemptions exceeded the primary vaccinationsthe figures being 44.5 per cent and 40.3 per cent respectively At the present time a considerable number of male adults are protected by the compulsory vaccination of war-time, but female adults and children are largely unprotected What is the result, as far as the incidence of small-pox is concerned, in England as compared with European countries? Sweden has had no cases for 2 years, Norway has had one case in 5 years, Denmark has had no cases in the 5 years 1919-1923, Germany—where the precautions were relaxed during the war, and where there were 5012 cases in 1919—has brought the incidence of small-pox steadily down to 2042 in 1920, 688 in 1921, 215 in 1922, and 17 in 1923 England's record is 7 cases in 1917, 63 in 1918, 311 in 1919, and so on by leaps and bounds until 1925 when there were 5365 cases, 4132 of which occurred in unvaccinated persons. A pretty state of things for Jenner's country! H W CARSON, FRCS, Eng

SEVENTH DISTRICT BRANCH

The Twenty-second Annual Meeting of the Seventh District Branch of the Medical Society of the State of New York was held on Thursday, September 27, 1928, in the Oak Hill Country Club, Rochester, N Y

The meeting was called to order by the President, Austin G Morris, MD, at 11

o'clock

The first paper read was on the "Fundamental Facts of Poliomyelitis," by Wardner

D Ayer, of Syracuse

The speaker called attention to the fact that this condition is more prevalent than is ordinarily accepted by the physicians of the various communities, and also suggested that as the profession becomes interested in the condition they are more likely to recognize the early manifestations of the disease and probably more cases will be reported speaks of it as a "tragic disease" of which the cause is not known Various types of the disease were described, "dromedary type," "bulbar type," and the encephalytic chief symptoms given in the order of their occurrence were mentioned as First, fever, second, headache, third, rigidity of the neck, fourth, tremor, fifth, apathy, sixth, vomiting, seventh, retention of urine, eighth, constipation, ninth, a peculiar sweating

These symptoms and a positive spinal fluid

-the diagnosis is without doubt.

In the treatment it was emphasized that convalescent serum, so far as avoiding paralysis is concerned, to be the most helpful

The reader reports 129 cases treated in this way, with 96 recoveries Most of these were treated in the so-called abortive stage Treatment begun when the paralytic stage is on is

of very little avail

The convalescent serum is given intraspinally-10 to 25 cc and should be given before paralysis begins Under certain conditions it may be well to repeat the dose in 20 hours or so The reader spoke of the difficulty in determining the time and amount for the second dose, also says that the third dose is rarely necessary as the patient is either showing marked evidence of recovery or has already died Several case reports were shown on the screen which were very interesting Other treatments were mentioned, such as intravenous serum which he says is not necessary, and also of Rosenau's work which seems to be still questioned

The paper was discussed by Dr Card of Poughkeepsie, Dr Dake of Rochester, Dr Redman of Hornell, Dr Wilson of Clifton Springs, and Dr Gibbs of Mendon

It was generally agreed that this serum should be available to all districts of the State

and more definite arrangements should be made so that the profession may know where it can be obtained

This paper was followed by an address by Harry R. Trick, M D, President of the Medical Society of the State of New York, who urged the advantages of a larger attendance of members at the District meetings, spoke of organized medicine, and called attention to the history of the State Medical Society and its various activities

Daniel S Dougherty, M D, Secretary of the Medical Society of the State of New York, followed President Trick's address by calling attention to the advantages of the District meetings, and also the necessity for news from the doctors of the State of New York which is desired by the State Medical Journal

James E Sadlier, M D, Chairman of Public Relations Committee, was asked to continue this program after luncheon which was served at the Country Club His remarks were followed by Dr Farmer, of Syracuse, who spoke a few minutes on the postgraduate instruction which is being arranged for the counties of the State, and asked that the Seventh District counties attempt to show a large attendance at these meetings

The balance of the day was spent in reading and discussing scientific papers, the first of which in the afternoon was a paper by Emil Novak, M D, of Baltimore, Md, on the "Differential Diagnosis of Menopausal and Postmenopausal Hemorrhages," with lantern slides He classified these hemorrhages as follows First, the anatomical, second, the aberation of function, third, combination of the first and

second

His remarks were confined largely to hemorrhages which occurred after the age of 35 He advised, first, that in early cases, or rather in the beginning of hemorrhages, the chief concern should be to determine whether the condition is due to malignancy or not. This can be determined first, by biopsy, second, by diagnostic curettage. He insisted that in order to do this work satisfactorily it is necessary to have a specially trained pathologist who is willing to cooperate with the surgeon in every The reader called attention to predisposing conditions causing or leading to cancer, such as laceration of the cervix, erosion of the cervix He then showed slides illustrating these conditions and called particular attention to the glandular hyperplasia

The paper was discussed by Dr Farmer of Syracuse, and Dr Cadmus of Rochester

In closing the discussion, Dr Novak traced the development of radium treatment in cancer of the cervix The cures by radium in ern standards as contrasted with those of a quarter of a century ago. Among the modern standards which he described were the following

The importance of end to end apposition of

bones broken completely across

The value of immediate replacement and fixation of displaced fragments

The early movements of joints in the limb

The importance of considering the entire body of the patient and not merely the bone that is broken

The value of immediate operative treatment in

proper cases

The importance of suspension and extension with calapers in removing the necessity for operation

A study of end results of fractures

A recognition of the need that some doctor in every community should be specially trained in fracture treatment

The will to get well is now often absent in compensation cases and delays their recovery. The value of the will to get well was illustrated by the experience with soldiers who were always anxious to return to a normal life. (See Dr. Scudder's article on "Fracture Treatment Today," in this Journal of October 1, 1928, page 1163.)

The surgical management of the ruptured appendix was discussed by Dr Arthur W Booth, of Elmira, who advocated the two-stage operation when an abscess was found The first operation was confined to the opening of the abscess and introducing a drain with no attempt to find the appendix or ligate it After recovery a second operation was done to remove the appendix This method gave a reduced mortality,—a consideration of especial importance in view of the increased mortality from appendix operations in recent years

All the scientific papers were of a peculiar interest and practical value, and the authors have been invited to contribute them to this JOURNAL

Medical Society practice was discussed briefly and pointedly by the State Society officers in the dining room immediately after the luncheon

Dr Harry R Trick of Buffalo, President, said that public health matters had always been promoted by the physicians of New York State. The Medical Practice Act of 1806 placed on the doctor the triple burdens of public health, medical licensure, and the prosecution of irregulars. Physicians had induced legislators to establish departments of health to perform public health duties. The legislators had also placed the regulation of medical education and licensure with the State Board of Regents, and assigned the prosecution of irregulars to the Attorney General

Unsolved problems are still pressing upon the medical profession, of which one of the most important is the relation of the medical profession to voluntary health organizations. Physicians must consider this relation, whether they wish to do so or not, and the penalty of failure to solve the problem will be the establishment of State Medicine in all lines of medical practice.

Dr Daniel S Dougherty, Secretary of the State Society, spoke of the advertising standards of the New York State Journal of Medicinf, and the care which the Publication Committee is taking to eliminate those products which doctors condemn while exercising the right to judge the

value of those which doctors use

Dr Dougherty also spoke of the finances of the State Society, and told how the Budget Committee had received requests for money exceeding the income of the State Society. The Budget Committee had cut down the requests, and the Trustees had cut them down still more and yet had preserved all those items whose value has been proven by past experience.

been proven by past experience
Dr John A Card, Speaker of the House of
Delegates, described the plan of the State Society for giving the members Indemnity Insurance
with rates as low as possible He said that the
Committee on Insurance would issue a descriptive statement of the State Society plan of In-

surance (See page 2050)

Dr James E Sadlier, past-President, and now Chairman of the Committee on Public Relations, referred to the overwhelming importance of the work of the Committee on Public Relations, and urged that each county society form such a committee The particular point in naming the committee was that the Chairman should be chosen for his interest in the work, his executive ability, and his willingness and desire to devise plans suitable to his own county

Dr Sadlier said that the promotion of the leadership of doctors in all public health matters would be a major activity of the State Society during the coming year. Among the activities which he suggested the societies to take part in

were the following.

Popular Medical Education,
Diphtheria Prevention,
Tuberculosis Lectures,
The Establishment of County Health Units,
Periodical Examinations,
Child Welfare Work,
Pre-natal Clinics

Dr Sadlier urged physicians to read the STATE JOURNAL in order to keep themselves informed regarding the activities of the medical societies of the county and state

made to publish the collective lectures, about a dozen of the papers dealing with fundamental subjects will be printed in the Bulletin of the New York Academy of Medicine, the first one being the lecture "The Pathology of the Aging Process," by Dr Aldred S Warthin, Professor of Pathology, University of Michigan, which will appear in the October Bulletin

The decentralization of the events of the Fortnight was a remarkable feature of the program The hospitals of the City were listed according to three districts—downtown, midtown, and uptown The same series of clinics were held in each district, and nearly every hospital of importance of the City was represented. The program of the downtown district carried the names of over one hundred teaching clinicians, while forty-five lecturers were on the program of the

afternoon and evening sessions Thus, over four hundred physicians were listed as teachers during the Fortnight

The newspapers have considered the events of the Fortnight to be news of vital interest, and have used items extensively. One of the most popular of the news items was that by Dr. Samuel Lambert describing the use of alcohol by the aged

A remarkable by-product of the Fortnight was the number of cranks that it enticed One doctor complained long and loudly because he could not find anything on pediatrics Another doctor wished to provide homes for aged physicians, and he himself wanted only a house, a little garden, and a big dog

The Fortnight will undoubtedly result in a development of great interest in the special conditions associated with old age

THREE GENERATIONS OF DOCTORS

Dr Walter D Ludlum, of Brooklyn, writes

"My father, Charles H Ludlum, is still an active member of the Nassau County and consequently of the State Medical Society. He was born in East Jamaica, now Hollis, N. Y., February 21, 1843, graduated A B 1863, A M and M. D 1865 at New York University, Phi Beta Kappa at college. He interned at Bellevue, practiced in New York City and Boonton, N. J., and, since 1878, at Hempstead, N. Y. Aside from his professional duties, he has been prominent in village activities, more particularly school work, having been a member of the Board of Education for forty years, and its President most of that time, for which a new school is being named for him

"The writer, Walter D Ludlum, was born in Boonton, N J, 1875, graduated in medicine from New York University 1898, interned at the Methodist Episcopal Hospital, and has practiced in

Brooklyn ever since

"Walter D Ludlum, Jr, was born in Brooklyn 1903, received his M D degree from Columbia in 1927, and is now an interne at the New York Post-Graduate Hospital

With good fortune our family may soon have three contemporaneous active memberships in the State Society"

Dr Charles P McCabe, of Greenville, Greene County, belongs to a family in which some member has been in the active practice of medicine for 127 years in Greenville The first physician of the family was Dr Amos Botsford who was born in Newton, Conn, February 13, 1780, and began the practice of medicine in Greenville in 1801 where, according to the town records, "He was a faithful, intelligent, and successful practitioner for over 50 years" He died at the age of eighty-four, leaving a son, Gideon, and a daughter, Mary

Gideon Botsford graduated from Fairfield Medical College in 1832, and practiced medicine with his father in Greenville with unusual success

Mary Botsford married a physician, Dr Bradley S McCabe, who was associated with the two Doctors Botsford in medical practice in Greenville Their second son, Charles Philip McCabe, began the practice of medicine with his father, and still continues to practice in Greenville. He was President of the Third District Branch Medical Society in 1925-26 His only son, Charles P McCabe, Jr, went to the U S Naval Academy instead of a medical school

early cases were just as good as the surgeon's cures, besides there were no deaths with the radium treatments, while with the surgical treatment the fatalities may be as high as 10 per cent or 15 per cent in various places or clinics. He states that in Baltimore the radical operation is still done in favorable cases. Organotherapy in early cases of hyperplasia is coming, as the substances administered are more definitely understood, such as corpus luteum and pituitin. The reason given by the reader for the preference of surgery to radium and x-ray at present is, because in the younger women sterility might be easily brought about by radium and x-ray.

The sixth event of the program was a paper or talk by Carl J Wiggers, M D, of Cleveland, Ohio, Professor of Physiology of the Western Reserve University School of Medicine spoke on the "Laboratory and Clinical Methods for Cardiovascular Study," and suggesting for better interrelation, illustrating his talk with lantern slides Dr Wiggers succeeded in showing how the clinical methods may be made quite cumbersome with an excess of technique, and how with the present instruments available for the study of heart cases the conditions may be made quite simple spoke of the dynamics of the heart and of the relation of decompensation thereto, stressing particularly in knowing the exact size of the heart and under changed rates He referred to the work of Starling in relation to this

The last paper on the program was by Dr John Pemberton of Rochester, Minn, Mayo Clinic, who spoke on the goiter problem He referred to investigations made by physicians in Utah, who found among school children that 32 per cent of the boys and 54 per cent of the girls had enlarged thyroids, and called attention to the increasing prevalence of goitre At present 14 per cent of the operations done of all conditions at the Mayo Clinic are for goiter He divided the goiter cases into two groups—the endemic goiter, or simple, and referred particularly to the benefit of the iodine

treatment in these cases Says there is no proof that there is danger in small doses of iodine. All adenomatous goiters, according to the reader, should be operated, first, because of the possibility of the toxicity of the disease, and second, because of possible malignancy.

The next group discussed was exophthalmic goiter of which he says the cause is not known. It may be a nervous trauma. In the United States he feels that probably the condition is endemic, that in the United States it is more prevalent where endemic goiter is present, and this relation cannot yet be explained

In treatment of exophthalmic goiter he feels that operative treatment is daily becoming more successful, first, because of the preliminary iodine treatment which is so successful Second, because surgical technique has so greatly improved and third, because these cases are diagnosed earlier than they were formerly He thinks that teaching on exophthalmic goiter to the medical student is wrong, that we should not insist upon having all of the cardinal symptoms before the diagnosis is For example, exophthlamus is not necessary to make the diagnosis of exophthalmic goiter He seems to depend largely upon the history, upon the swelling, the rapid pulse and the disturbance of metabolism. This paper was discussed by Drs Jamison, Prince and Ward of Rochester, also Dr Fowler and Dr Foster of Penn Yan

At the close of the meeting a film prepared by the Mayo Clinic, showing intestinal peristalsis in cats and rabbits was thrown upon the screen, after which the meeting closed

The attendance of this meeting was quite satisfactory from every standpoint. There were something over 250 physicians present out of the 748 members of the Seventh District Branch. The room in which the meeting was held was crowded from the opening in the morning until the close at 600 o'clock in the evening.

JOHN A LICHTY, MD, Secretary

THE GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

As this Journal goes to press, the Graduate Fortnight of the New York Academy of Medicine has been nearly completed according to the plans announced in the July 15, September 1, and September 15 issues of this Journal Every speaker has presented his paper on schedule time, the hospital clinics have been held as announced, and in every respect the Graduate Fortnight has been a great success

The attendance at the afternoon sessions in the

Academy building has averaged more than 150, while over 500 physicians have attended the evening sessions, with the meeting-room often crowded. The audiences have been drawn from all over the country, from Vancouver to Maine, while one doctor came because he got word of the Graduate Fortnight by news radio while he was in the middle of the Atlantic Ocean.

The lectures covered every phase of the problems of old age While no provision has been recommendation that the rate increase be approved as necessary. The Executive Committee in turn examined all of the facts, and weighed the recommendation which the Insurance Committee had made, and as a result of an independent study of these, passed the following resolutions.

Whereas, in the year 1921, the malpractice indemnity situation in New York State had reached an alarming state of disorganization, uncertainty and high costs, and the Medical Society of the State of New York, in order to provide its members with a stabilized source of indemnity protection at controlled and equitable rates considered it necessary and desirable to organize a Group Plan of Malpractice Indemnity and Defense, and

Whereas, after a careful investigation of the various reliable insurance companies, authorized to legally transact business in the State of New York, it was concluded that the Aetna Life Insurance Company of Hartford, considered from every viewpoint, was the best company available, and, in fact, the only company willing to enter into a fair and equitable agreement with the Society, and in April, 1921, the Society entered into an agreement with the said Aetna Life Insurance Company whereby that Company undertook to provide malpractice indeminty for members of the State Society only under a Group Plan devised by the Society under terms and safeguards extremely favorable to the members, and

Whereas, one of the terms of the agreement stipulated that the rate for such indemnity, after the first three years, would be modified from year to year in accordance with the actual cost of the business computed on a basis of not to exceed two and one-half per cent profit for the company and a careful and scientific tabulation of the cost for the seven years ending December 31, 1927, shows conclusively that the cost per insured member per year for each year of operation has been in excess of \$3200 for the minimum policy of \$5,000 \$15,000, and

Whereas, during that period the members have been called upon to pay an average premium of only \$21 43 for the minimum policy resulting in a continued and substantial loss for the Company, and in order to insure the continuance of the Group Plan, it is necessary under the terms of the agreement, that the Society recognize the disparity between the cost of the protection which the members enjoy and the rates which they have been required to pay, and

Whereas the relation of our members and the Society with the Aetna Life Insurance Company throughout the seven years have been highly satisfactory in every respect and a continuance of our relations with that Company is deemed for the best interests of the Society and of its members, now therefore,

Be It Resolved that an increase in the base rate of \$2400 for the minimum policy of \$5,000/\$15,000 to \$3200 be approved and recommended for the renewal of the agreement expiring April 30, 1928, to remain in effect without change for a period of three years, and

Be It Further Resolved, that a copy of this resolution be made available to each member as and when his protection becomes affected by the new rate, and that all members requiring malpractice indemnity protection be urged to secure and continue it through the Group Plan of the State Society

From time to time, other insurance companies, through their local agents, have approached certain members of our Society with proposals temporarily to insure them at rates slightly less than those required by our Group Plan In every instance, it has been found

that these companies were unwilling to accept the Group as a whole or to subscribe to the terms previously mentioned,—the only terms that our Society deems adequate for the protection of its members Furthermore, isolated individual physicians, who from time to time have been persuaded to accept policies in such companies, have learned to their surprise and regret that by the terms of their policies in such companies, they were denied the privilege of the legal services of our general counsel Thus, in all matters not only pertaining to the preparation and trial of cases, but also in the vital questions relating to settlement, they have discovered that under the terms of their policies in such companies, neither our legal counsel nor the Society had any voice whatever

In addition to the various companies authorized to do business in this State who from time to time have sought to carry on a sporadic and piecemeal competition with our Group Plan, there is one foreign company which is not authorized to do business in this State, which has nevertheless flooded the mails with advertising matter. In this connection, we would refer to an editorial written by our legal counsel entitled "Bootleg Insurance," and appearing in the August 15th, 1928, issue of the State Journal

Other companies, actuated by a desire to advertise or to give their agents and solicitors a wedge with which to win their way into doctors' offices for the purpose of soliciting other forms of insurance, may from time to time undertake to sell malpractice policies at rates lower than those we pay in the Group, but they cannot do so for long, as has been demonstrated by several experiences of that kind within recent years They cannot escape the necessity of basing their rates upon the cost of hazards insured, and no company, no matter how large and competent, without the cooperation of the Society and its legal department, can hope to establish a cost ratio lower than that of the Group Plan Sooner or later, they must raise their rates to the level of cost or higher in order to make up for the losses that such rate-cutting inevitably entails

From a prolonged study, acquaintance and contact with the nature of our Group Insurance Plan, and with its operation, we assert with confidence that it is one of the most beneficial activities of our State Society, and that its merits are such as to bespeak and justify the loyal and wholehearted support of every member of the Society Through the office of our authorized indemnity representative and that of our legal counsel, as well as through direct contact of our Insurance Committee, the New York State Medical Society

THE MALPRACTICE RATES OF OUR GROUP INSURANCE PLAN

Report of the Special Committee of the Medical Society of the State of New York

Your Insurance Committee has watched with satisfaction the continued growth in the support of our Group Plan of insurance. The increase in the rates, which went into effect in April of this year, has been generally understood and approved by our members. Our attention, however, has been called to the fact that, here and there, there has been some lack of complete understanding of the reasons which underlie the increase in rate. The Insurance Committee of your Executive Committee has deemed it proper, therefore, to make this statement for the benefit of all

The Group Plan of malpractice insurance was organized by the State Society in 1921 at a time when the increase in the number of malpractice suits made this type of insurance particularly necessary for the members, and at a time when the insurance companies writing this type of policy had, by their disastrous experience, been forced to greatly increase their rates, or to withdraw from business that time, an intensive study of the whole question was carried out by our Society, and an investigation was made of the various companies authorized to do business in this State, and of the terms and conditions upon which business relations with them might be sus-The salient points upon which our Society insisted were three

First, that no policies be issued except to members in good standing of the State Medical Society. This provision was necessary to prevent an unfavorable experience with non-affiliated doctors from being charged against the State Society's Group operation.

Second, that all suits and claims against insured members be handled exclusively by the legal counsel for the State Medical Society, to the end that the members might have the benefit of the concentrated medico-legal experience which the Society had so painstakingly built up during the preceding decade, and in order that their cases might be handled not only by an expert but by one in close touch and with first-hand knowledge of the best point of view of the medical profession

Third, that the rate charged should be based upon the actual cost to the carrier, plus a nominal compensation for handling charges,—this rate to be modified from time to time, either up or down, in accordance with the actual loss experience

With these three points in mind, the plan was offered to the various reputable insurance companies, legally authorized to issue this type of insurance in this State. As a result of prolonged negotiations, and with no little difficulty, the plan embodying these points was

finally accepted by the Aetna Life Insurance Company of Hartford

For the same reason that impels us to retain the services of counsel, it was deemed wise to have the benefit of disinterested expert insurance advice To this end, Harry F Wanvig, who was formerly an officer of one of the old English companies authorized to do business in this country, and who was a man with long insurance experience, was selected as the authorized indemnity representative of our State Society He has been acting in this capacity since 1921, and has converted this office into a self-supporting indemnity department of our Society, devoting all of its time to this undertaking, and being responsible to the Society for the proper conduct of the Group Plan in all of its features, except those pertaining to the handling of suits and claims, which are conducted by our general counsel, Lloyd Paul Stryker The duties of Mr Wanvig's department include a yearly check and examination of the operative cost, and a constant contact with the malpractice insurance

market offered by other companies

Since the installment of the Society's Group Plan in 1921, it has operated to the eminent satisfaction of the Society, its officers and the individual members The various features and details of the plan have been explained, from time to time, in various articles, annual reports and editorials appearing in the New YORK STATE JOURNAL, and also through various papers read by both Mr Stryker and Mr Wanvig at the meetings of various county societies and other medical gatherings cial reference is made to the annual report of Mr Stryker printed in the April 1st, 1928, issue of the STATE JOURNAL, and that of Ex-President Sadlier appearing in the May 1st, 1928, issue The three points previously referred to were embodied in our agreement with the Aetna Life Insurance Company, and the plan then designed has been in complete and satisfactory operation since the date of its In the early months of this year, inception our attention was called to the fact that the experience in handling the business showed that an increase in rate was necessary in order to meet the increased cost of the business as provided in our agreement with the company A complete and scientific investigation was then carried out by your Insurance Committee, during which all of the figures and data of the insurance carrier were fully submitted, and were scrutinized and studied Your Committee spent many days in this work, and finally presented the results of its inquiry to the Executive Committee, together with a

Watertown Tonawanda Elmira participates in tabulating and checking the costs upon which the rates are based, and in directing the policy and methods of defense of its members. Through the action of our Society, our members enjoy the broadest form of policy issued by any company in the State, backed by the faith and credit of a financially powerful and honestly administered insurance carrier. There can be no question of unfairness either to the policy-holders or to the company, and no opportunity for one to profit at the expense of the other, as long as both partners live up to their obligation under the agreement

We quote with approval the following from Ex-President Sadlier's annual report "About 58 per cent of our membership is insured in

the Group Plan against liability in the practice of their profession. This system of protection should be adopted by a much greater percentage of members. One wonders how so many dare to assume the personal liability incurred by not being protected in this way Perhaps it is due to lack of familiarity with this excellent plan adopted by our Society."

Your Insurance Committee is in close touch with the whole situation, and if there is any physician desiring further information to that herein contained, his letter, if addressed to the Secretary of the Society, will receive

prompt attention

John A Card, Chas Gordon Heyd, Special Committee

TIME FOR THE ANNUAL REGISTRATION

As the time for the annual registration of physicians is approaching, this Journal is printing the following letter announcing the plans of the State Department of Education—Editor's Note Dear Mr Editor

As you are doubtless aware, the law provides that this Department shall send to each physician annually on or before the first day of October an application for annual registration for the ensuing year. Application cards for registration for the year 1929 are going out from this office this week and before the end of the week should be in the hands of all the physicians of the State

Will you be good enough to insert a notice in the Journal to the effect that we hope that any physician who has failed to receive his application card by October first will advise us to that effect at once in order that we may supply him with the application card? Will you also add that promptness in the return of the application will enable us to handle the registration more effectively and that every physician should remember that the law provides that he should file his appli-

cation with this Department prior to January first?

We have done all that we could to check over our list and make it complete so that every physician will receive an application card, but in so large a list it is almost impossible to avoid a few errors and we shall appreciate being advised of these errors in order that we may correct them at once

Following our policy of simplifying registration procedure as much as possible, we have

adopted a new expedient for this year

Heretofore when application cards had been received after the first of October we have immediately forwarded a registration certificate for the ensuing year. This year the registration application will be acknowledged with a note that the registration certificate will not go forward until the latter part of December.

Appreciating your cooperation in this matter,

I beg to remain

Very truly yours,
CHARLES B HEISLER,
Assistant in Higher Education

MEDICAL WARES

PRINTED ILLUSTRATIONS

Illustrations, charts and graphs now adorn the pages of medical journals as they do those of most other periodicals. The originals of the ordinary pictures which appear in this Journal consist of two elements.

1 Lines such as those drawn by a pen or pencil

2 Masses of black or other color as in a photograph or painting

The pictures which are reproduced on the printed page are facsimiles of the original drawings, photographs or paintings, and are made from plates of two kinds

1 The lined plate

2 The dotted plate or half-tone

Both kinds of plates are made by photographic processes which reproduce the elements of the

ordinary plate

The Line Plate The lines of an ordinary lined drawing are so coarse that they may be readily seen with the naked eye The original drawing is usually made two or three times the size of the completed plate, for reducing the size of the drawing also reduces the apparent roughness and imperfections of the lines The original picture looks as its printed reproduction appears when it is examined with a magnifying lens is only the exceptionally perfect drawing that can be reproduced in its natural size or enlarged lines, but lines that are somewhat rough and irregular may appear smooth and even when they are reduced to one-half or one-third the size of the originals

The line drawings are usually reproduced on plates of zinc by processes of etching with acids. The original drawing is photographed upon the zinc by a process which is like that of ordinary photographing, but the plate is developed by a process of etching with acid which eats away the parts between the lines and leaves the lines raised above the rest of the plate. The process is simple, rapid and cheap, and is well adapted for charts, graphs, tables, maps, and other designs which can be drawn in lines. The illustration on page 2054 is made from a line drawing which was reproduced from the printed page of the New York Herald-Tribune.

The Half-Tone An ordinary photograph or painting consists of masses of black and white, which show all gradations of light and shade from pure white to black. A plate made by the method of the line plate would show none of the details of the gray tones of the picture, also the darkened parts would print in solid masses of ink which would smudge the completed picture. The picture on the plate is therefore formed by minute dots which seem to blend together when they are viewed as in ordinary reading. An illustration consisting of dots is called a half-tone, for it reproduces all the tones of light and shade of the original photograph or painting.

The method of producing a half-tone plate is that of photographing the original picture upon a copper plate, through a glass on which fine lines are ruled up and down, and crosswise, thus breaking the picture into small squares which appear on the printed page as dots. The photograph is then developed by etching the plate with acid as in a line plate, but the process is far more delicate.

The lights and shade of a half-tone plate vary according to the size of the dots, which are large in the darker portions of the cut, and extremely small in the white parts. The illustrations on page 2018 of this Journal are made with 133 dots to the linear inch, or 17,689 per square inch. Those of a newspaper contain from 65 to 85 dots per linear inch according to the smoothness of the paper on which they are printed. The finest half-tones contain from 175 to 200 dots per linear inch, but these plates must be made with great care and printed on fine glazed paper.

There is nothing mysterious about preparing illustrations for medical articles. The first essential is that the original picture shall be distinct, and that every part shall stand out clearly. Lines and figures on the original must be large enough to be easily read when they are reduced to the size in which they will appear on the plate.

The standard size of cuts in this Journal are either three inches or six inches in width, in order that they may fit either a single column, or a double column

THE DAILY PRESS

From the New York Herald Tribune, Sept 27, 1928
Economizing Health

RELIEF FOR TRAFFIC CONGESTION

The newspapers frequently print fanciful schemes to relieve traffic congestion in New York City, but the newspapers of October 6 described an actual demonstration that was so indiculously simple that the man who tried it successfully was arrested for disturbing the peace simply because he drew an applauding crowd. The New York Times with its reputation for seriousness makes the following editorial comment on the incident

The authorities made a bad error in judgment when they committed to Bellevue yesterday the middle-aged negro caught running along Broadway near Forty-second Street on the tops of street cars, buses and taxicabs The policeman who had him locked up say that he was out of

work and took this unusual method of advertising

But is this any indication that he is demented? On the contrary, he may be a genius. He may have discovered the solution of one of the most difficult problems with which the city is confronted. The gentleman should be referred to the Mayor's Committee on Plan and Survey, not to Bellevue.

Congestion is terrible, and growing worse. The air is full of schemes for double-decked streets and bridges for pedestrians. But these things are expensive and the city is poor. What if the pedestrians could be persuaded to give up the sidewalks altogether and trained to walk on top of the moving lines of vehicles?

HEALTH EXAMINATIONS IN FACTORIES

Prejudice against physical examinations of factory workers is hard to overcome in spite of the excellent results that have come from them. Owners sometimes object to the examinations on account of their cost, and workmen oppose them because their result is often the rejection of the applicant for work However, the Workmen's Compensation Act has promoted the examinations, for when they are made workmen can no longer claim damages for conditions which existed before they began work in the factory The development of hernia was formerly a frequent ground for claims for damages, but the claims have ceased in one factory where examinations are made and releases are secured for conditions, such as incipient hernia, of which the workmen are unaware

People generally are becoming educated regarding the value of health examinations of workmen The New York Sun of September 11 has an excellent editorial on the benefits of the examination, in which it says

"Surveying cosmetic factories A, with 661 women on the payroll, B with 388 and C with 708, the New York State Department of Labor finds that in six months there are 79 visits to the medical dispensary in A for every 100 workers, 150 in B and 350 in C A and B

subject applicants for jobs to physical examination, C does not Consequently C's workers are not selected risks

"In Factory A 'every possible means of safeguarding the worker' has been adopted. The reason why C has so many visits to the dispensary seems obvious its owners consider treatment of industrial diseases more desirable than prevention. Theirs is an antiquated point of view in economics as well as in humane feeling.

"The nurse in charge of Factory B's dispensary gives many more treatments than does the nurse in Factory A, the policy of whose management is to restrict the plant activities to diagnosis and reference to the family physician. Executives are not agreed as to which practice is better, but there is no dispute about the high desirability of safeguarding the health of workers. The production managers' reports reflect the activities of the plant nurse. The owners of Factory C should wake up."

It seems ironical that the studies were made in a cosmetic factory, but after all, the owners of the less healthful factory were consistent if they believed in the efficacy of their products to produce the appearance of health

SOUL AND BODY

The daily papers have recently described the proceedings of several scientific congresses which included in their programs subjects involving the origin of life, the existence of the soul, and the extent of eternity, and other subjects which are ordinarily classed as religious. The newspapers of September 7 stated that Sir William Bragg, the new president of the British Association for the Advancement of Science, believes in the duality of the soul and the body, while his predecessor, Sir Arthur Keith, believes that the soul and body are one The New York Herald-Tribune of September 7 says editorially

"Interesting is inquiry why Sir William Bragg's soul, or Sir Arthur Keith's non-soul, is any more news than Mr A's soul or that of the first vice-president of the Ninth National Bank The answer, we suspect, is pub-

lic persuasion that treason is a dramatic crime and that it is somehow treason to his craft for any scientist to view religion with respect. This is really a delusion of indigestion, the result of one school of thought trying to swallow the universe

"Scientists and religionists are neither of them quite guiltless of pretending that their respective views are mutually exclusive, each covering the whole universe from aardvark to zymosis, with no atom of standing room left for the other. We will progress further in understanding, although perhaps with fewer blank columns filled with scientists' souls, when faith and science each acknowledge the world as wide enough for both"

Physicians who deal with life and death more intimately than any other group, will generally agree with the editorial writer

BOOKS RECEIVED

BOOK REVIEWS

THE SIMPLE GOITRES. By ROBERT McCARRISON, C.I E., M.D. Octavo of 106 pages, illustrated. New York. William Wood and Company, 1928 Cloth, \$400

The book is divided into two parts. The first part deals almost entirely with what the author terms "parenchymatous or chronic hypertrophic goitre." There is very brief consideration of diffuse colloid goitre and lymph adenoid goitre at the end of this section Part two is devoted to 143 figures illustrating various types of endemic goitre among the natives in certain sections of India. There are also abundant illustrations of the thyroid gland of both man and animals from cases of endemic goitre and cretinism. Of the simple goitres, the parenchymatous or chronic hypertrophic goitre receives almost the entire attention of the author. This is the classical type of endemic goitre occurring in the mountainous regions of India and characterized by a true hypertrophy and hyperplasia, together with the appearance of circumscribed areas of more or less solid glandular tissue, the adenomata. The author endeavors to show how closely the causation of the chronic hypertrophic type of endemic goitre is interwoven with the composition of the food, with infection of the gastro-intestinal tract and with the role of the thyroid gland and of todine in the phenomena of nutrition and oxida-Abundant experimental evidence is offerred to support the views of the author who believes that this type of goitre is caused by a positive toxic agent derived from the gastrointestinal tract. The role of iodine in the causation of the chronic hypertrophic type of gotte, receives mention largely because of its inter-action with the factors mentioned above. The author stresses the great complexity of the goitre problem and warns against the assumption that the only or even predominate factor is the insufficiency of iodine. The illustrations are excellent. The book should be of great value to those interested particularly in public health problems and to students of endocrine diseases and to those interested in experimental phases of the goitre problem EMIL GOETSCH

EAT, DRINK AND BE HEALTHY AN Outline of Rational Dietetics By CLARENCE W LIEB, M.A., M.D. 12mo of 180 pages New York, The John Day Company, 1928 Cloth, \$150

This book aims to present the nature of foods and nutrition in a simple form without the encouragement of fads. It is intended as a guide for normal persons to prevent disease due to faulty eating. Its lively style with short sentences and chapters makes it easy to read.

The three parts discuss the "philosophy of eating," "choosing your diet" and "unfamiliar facts about familiar foods and beverages '

The author believes that spinach is not the very desirable vegetable that it is commonly supposed to be partly because of the high residue undesirable in many patients who should have a smooth diet, and partly because the oxalic acid content is said to chemically unite with the calcium of the blood, thus decalcifying it, with the production of crystals of calcium oxalate which being excreted by the kidney, may contribute to the formation of kidney stones. Another idea which is unusual is that animal proteins and concentrated carbohydrates should be avoided at the same meal unless combined with a liberal amount of vegetables and fruits.

Its absence of technical language, its readability and common sense views, will make it a very useful book for the patient W E McCollom

THE NEW YORK ACADEMY OF MEDICINE LECTURES ON MEDICINE AND SURGERY [First Series, 1927] Octavo of 319 pages, with 39 illustrations New York, Paul B Hoeber, Inc., 1928 Cloth, \$500

In this volume, which closely resembles the "Practical Lectures" delivered under the auspices of the Medical Society of the County of Kings, a wide field of medicine has been efficiently covered. The wealth of chinical experience of the contributors is passed on to the reader in a pleasant and clear cut manner. The lectures on cardio-vascular syphilis and the cutaneous manifestations of the same disease should be welcomed by every practitioner, likewise-the lectures on the treatment of pneumonia and the discussion of various obstetrical problems met with in a general practice. Surgical subjects are treated very sparingly and bone-and-joint surgery including traumopathies are unfortunately not touched upon at all.

Geo Webb.

THE MIND OF THE GROWING CHILD Edited by VIS-COUNTESS ERLEIGH 12mo of 229 pages New York, Oxford University Press, 1928. Cloth, \$1 75

This work is the gathering together, into one volume, of sixteen articles by different British writers. All of these are lectures that were delivered at various courses arranged by the National Society of Day Nurseries. It occurred to the editor, Viscountess Erleigh, that while lectures were available for teachers, welfare workers, and others, no courses of lectures were especially arranged to meet the needs and requirements of the Mothers. The subjects treated in this book have been chosen by the mothers as the ones on which they desired information. Space will not permit the consideration of each of the sixteen articles, yet it is hard to pick out just a few for special mention. At the risk of making a poor choice, it would seem that the first chapter on "Heredity and Environment," by Dr. E. A. Bennet, the eleventh one on "Fear," by Dr. H. Crichton-Miller, and the thirteenth on "The Problems of the School Age," by Dr. Hector C. Cameron, deserve special praise. It is remarkable how much the physician may gather, without having to wade through a lot of scientific data, from the reading of articles which are meant primarily for the laity.

W. H. D.

LES ASSOCIATIONS MICROBIENNES LEURS APPLICATIONS
THÈRAPEUTIQUES By GEORGES PAPACOSTAS and JEAN
GATÉ. 12mo of 438 pages Paris, Gaston Doin et
Cie, 1928 Paper, 20 francs

This is one of a series of books constituting "L'Encyclopedie Scientifique," published under the direction of Dr Toulouse. It deals with microbic associations and their therapeutic applications. This work seems to be primarily intended for the bacteriologist and pathologist, taking up as it does the microbic associations "in vitro" with their two types, stimulation and antibiosis, and their associations "in vivo" with two types, synergy and antagonism. Certain other questions, such as the action of certain bacteria on certain bacterial toxins are also considered by the authors. A chapter is also included on the practical application of these microbic associations including the action of lactic ferments, pyocyanase, yeast, etc. At the end is a very complete bibliography arranged alphabetically.

SHORTENING THE MEDICAL COURSE OF STUDY

The Council of the Kentucky Medical Association, in its annual report printed in the September issue of the Kentucky Medical Journal, calls attention to the need of more physi-The same issue discians in rural districts cusses the need of physicians in the country, in an article by Dr W G Kinsolving, read before the Southwestern Kentucky Medical Dr Kinsolving is from Eddy-Association ville, a town which he says will have no doctors except quacks when the present physicians die Dr Kinsolving states his plan as follows

"We want our young doctors to have a good practical common school education, a good practical high school education—then four years' training in general medicine. Then have a diploma and the title of M. D. Then after he practices in general practice for at least five years, if he wants to go into a specialty let him prepare himself for the special work of his choice"

"We say six months in a year for four years in a medical course, because this gives a better chance for poor boys and girls to work their way through medical college"

The doctor amplifies his plan as follows

"We must modify the medical practice law so men and women of moderate means can practice medicine. We want a law that will give us more general practitioners. We want a law that will demand a good common school education, a special high school education, that will give the essential knowledge of the branches that a doctor will need in the study of medicine, the essential branches that he will need and leave off the non-essentials."

"Then he wants to study twenty-four months—six months in each year for four years, and be taught in all the common diseases, diagnosis, practice, etiology, materia

medica and therapeutics—how to treat and cure a disease"

"It seems that the present teaching is diagnosis, but they don't pay much attention to therapeutics. The most important part is how to treat your patient and cure the disease."

"The practice of medicine is both a science and an art, but the art is the most important part. You may go to school thirty years, but if you don't practice, you will never be much of a doctor."

"General practice is the foundation of the whole system and no one can be a thorough competent specialist unless he has had at least five years' experience in general practice. We want a law that every young doctor must do at least five years general practice before he goes into a specialty."

Dr Kinsolving thinks that his system will produce men of greater attainment and devotion, and so it will if the medical students chosen under his system are the paragons of ability and character described in the following sentence

"The young doctor with a practical college course of twenty-four months, and is blessed with good common sense and talent, and studies and thinks and reasons all the time while he practices his profession, will rise to eminence and renown, and the people will rise up and call him blessed on account of the joy and happiness he has brought into their homes"

After all it is character and temperament that determine the civic good which a physician, or any other professional man, does. It is not to be expected that Dr Kinsolving's students will be of any higher character than those chosen under the present system.

KENTUCKY STATE MEDICAL ASSOCIATION

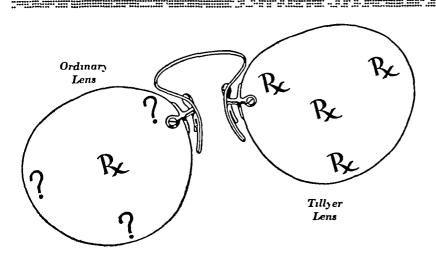

Rural Medical Service—The activities of the Kentucky State Medical Association are well set forth in the report of its Council, printed in the September issue of the Kentucky Medical Iournal It is surprising to read what the Council considers to be the principal issue before the medical profession of the United States

"The paramount issue before the medical profession of Kentucky and of the United

States, is the supply to the people of our country districts and small towns of medical service. It is essential that this issue be thoroughly studied and fairly met. We must no longer permit it to be side-stepped by the false statement that an attack is being made upon the high standards of modern medical education. It must be clearly understood that the

to OCULISTS:

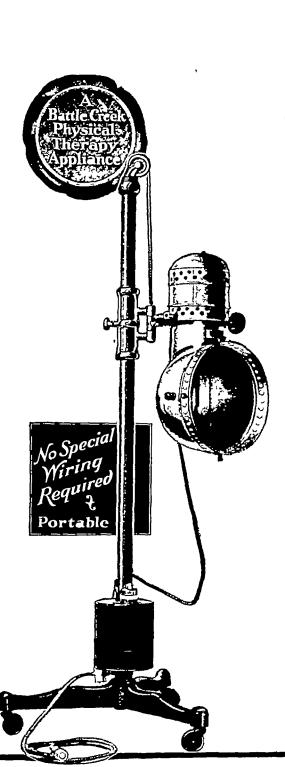

When you try Tillyer Lenses in your own glasses, you'll ask some such question as this: "Why do I get quicker vision and increased clarity with Tillyer Lenses made from the same prescription used for my other lenses?" The answer is that Tillyer Lenses, first, interpret your prescription as accurately in the margins as in the center; second, they are polished as fine camera and telescope lenses are polished. They will give your patients the same better vision that they give you.

The Battle Creek Super Solar Arc Lamp

For Heat, Light and Ultra-violet Therapy

THE new Battle Creek Super Solar Arc Lamp is unique in the field of Phototherapy appliances. It is the result of our own 40 years experience as pioneers in the production of therapeutic arc lamps in this country.

Many advanced features of construction make the new Battle Creek Super Solar Arc Lamp noteworthy A snap of the switch starts the arc burning at full power No time is lost in waiting for the rays to attain adequate intensity The lamp being automatically adjusted by magnetic feed, the largest are possible with the given current is always maintained.

A specially constructed adapter is furnished with the lamp It is designed so that the arc does not heat the applicators Any standard quartz applicator may be attached

By giving off rays in both the infra red and ultra-violet the Super Solar Arc may be used to successfully treat a wide range of diseases. The technic of handling it is easily mastered. Various spectra are instantly obtainable by the use of different carbons.

We have recently prepared a new bulletin which describes fully the many advantages of the new Super Solar Arc Lamp May we send you a copy?

Sanitarium & Hospital Equipment Co. Battle Creek Michigan

Battle Creek Therapeutic Appliances Include

Hydrotherapy Apparatus— Type G-3

The Battle Creek Hydrocherapy Apparatus is constructed through out of high quality brass The appliance has wall type control and gives jet rain or shower perincal needle spray and Scotch douches

Electric Light Bath Cabinets

Three models varying in size and cost. Each cabinet complete with special comfort chair and necessary bulbs Made of the finest hard wood water proof cemented veneer

The Battle Creek Radiant Baker

A tested appliance for heat application. The Baker is constructed of aluminum and asbestos and equipped with safety rheostar to prevent excessive heating

The Battle Creek Treatment Photophore

A most efficient appliance for making local applications of heat. It combines the essentials of many expensive therapeutic lamps in one simple effective appliance.

Council on Medical Education of the American Medical Association, has so controlled this whole subject that they have placed its guidance largely in the hands of deans and executive committees composed almost, if not entirely, of all time professors of the fundamental, purely scientific subjects. As valuable as has been the contribution of such men to scientific research, it must be recognized that most of them do not, and never have, engaged in the practice of medicine, and very few of them actually meet classes and teach undergraduate students."

The council gives a table showing the number of physicians in each county society of the State in 1907 and 1928 by Districts and Counties There was a loss of 400 members in six Districts and a gain of 446 in five, making a net gain of 46 members in 21 years Discussing this gain and loss the report says

"These increases are all in the industrial sections, whether urban or in the coal mining districts. In almost every county having a distinctly rural population there has been a marked decrease in the number of physicians. Counties in which this decrease has occurred are in far better economic conditions than they were in 1907. Practically all of them have larger populations. They all have a better educated citizenship that recognizes its dependence upon its profession. Most of the men who are in these counties now were practising there in 1907."

It is also surprising to find that the success of chiropractic legislation is ascribed to the lack of physicians in the rural sections, for

the report reads

"The only arguments that have, or can be presented against the effectiveness of our plan of medical organizations, is its failure to ade quately supply our rural counties with physi-This was the sole argument supported in favor of the chiropractic bill in the last Legislature. For years the Legislature has made it plain that they will be willing to accept our leadership, if we will offer them a solution of the problem If we fail to reform ourselves, the enactment of the chiropractic law gives us an indication that its solution will be brought about by those who are wholly untrained in the entire subject, but this indicates sufficiently that if we fail to provide trained medical men, popular demand will cause itself to be provided with untrained care."

The State Journal -Concerning the Kentucky

Medical Journal the report says

"It will be noted that the income of the Journal was \$10,235 11, and that the entire expense of its publication was \$9,873 22"

"A study of the progress of the profession from year to year, or, even more striking, from decade to decade, as indicated by the pages of the Journal can only afford gratification to our thoughtful members The Journal is intended to be a cross section of professional opinion in Kentucky for the month in which it is printed Viewed from this point, each Journal is a milestone of progress, which indicates that our people today are being given the most effective medical service they have ever had This is not only no reflection upon our predecessors in the profession, but it is indeed proof that our predecessors built wisely the great organization for which we are now responsible."

The Editors of the Journal have a unique arrangement with the printer

"During the year we have received more than usual criticism because of typographical errors Our printers pay \$1000 a day for each day's delay, and it will be noted that these deductions have been made regularly graphical errors are always annoying, but we make a deduction of twenty-five cents for each of them we find, and, while this is no solace to the injury offered, it has been a material aid in creating our surplus. It has been suggested that the Journal be printed by some large metropolitan plant, on the ground that this would increase its typographical excellence and improve its general appearance This has been tried twice in the history of the Journal, and the only notable change was the increase in expense The Council will be glad to have the instructions of the House of Delegates on this subject"

Malpractice Suits -Malpractice suits are discussed as follows

"We regret to report that there is no decrease in the number of such unjust blackmailing malpractice suits against reputable members of the medical profession

"It is very important that physicians, generally, carefully consider the character of such malpractice suits as are being brought To this end they are urged to read thoughtfully the decisions of the courts published currently in the Journal of the American Medical Asso-It is evident from careful study of such cases that there has not been a suit decided against a reputable physician in many years which could not have been prevented, if the legal precautions which should now be known to all of us had been taken at the right time The whole subject of malpractice procedure has become definitely technical, and, in order to avoid becoming victims of injus-

tice from its operation physicians must acquaint themselves with these procedures, as they do with the other complexities of modern medicine."

Narcotic Law -- Prosecutions for violations of the narcotic law are discussed as follows

"Again this year a considerable number of physicians have been convicted in the State or Federal courts for violation of the narcotic or prohibition laws. Acting under court instructions, the Council has, or will, when their penitentiary terms have expired, prefer charges against each of them with the view of revocation of their certificates to practice medicine in Kentucky The Council finds that the administration of these laws, which are approved by a vast majority of the physicians of Kentucky, has been made unnecessarily irksome to the competent, honest, selfrespecting members of the medical profession by their violation by the very small minority who have continued to ignore their plain purposes and provisions Regardless of individual opinion as to the wisdom of such a law, it is now well known by every physician in Kentucky, and in every possible way the pubhe should be taught that, under Federal law, narcotic habitues are not considered as having a disease and that they cannot be treated by providing narcotics under any circumstances

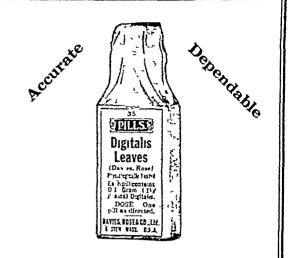

Alcohol Prescriptions—Equally drastic is the condemnation of physicians who prescribe alcoholic drinks for other than strictly medical purposes, the closing sentence reading

"The Council desires to repeat again that the officials charged with the enforcement of these laws cannot relax their strict constructions of its provisions, which seem to most of us frequently unnecessarily harsh, until the people have been protected from the class of negligent or soft-headed and soft-hearted physicians who pander to this trade and practice in violation of the law"

Public Health Responsibility — After a lengthy discussion of the success in securing the legislation for the maintenance of a high educational standard for physicians, the council discusses the responsibility which the success places on physicians and says

"The victory of the profession, however should be realized as squarely placing upon its shoulders the responsibility for improvement in public health. That the death rate from typhoid fever is being reduced, that diphtheria has been robbed of its victims by the use in children of toxin-antitoxin, and by the early and prompt administration of antitoxin to the victims of the disease, that the death rate from

(Continued from page 2063-adv xv)

tuberculosis has been reduced sixty per cent, that the preventable infectious diseases are constantly decreasing, is a matter in which every worthy physician takes pride Lark and more satisfactory incomes are being received by those members of our profession who are qualifying themselves to, and who are, making systematic physical examinations of the apparently well, who are undertaking the dietetic and hygienic management of their patrons, who are immunizing them biennially from typhoid fever, and permanently immunizing the children in their practice from diphtheria, and who are undertaking the sanitary supervision of the homes of the families in their practice, with a view to seeing that they are securing pure drinking water, and have safe and sanitary methods of sewage disposal, and are effectively protected from flies, mosquitoes and other insects These life saving services, provided by qualified men, are of recognized value to those who secure them, and they are paid for far more gladly and regularly than the purely remedial service of past decades"

Reform in Medical Education—The reduction of the State death rate to one-third the rate of 1888 and the reduction in the amount of quack advertisements in newspapers is made the basis for the following argument for the maintenance of standards of medical education
